This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

CHAMBERS'S JOURNAL

OF

POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 262. SATURDAY, JANUARY 2, 1869. PRICE 1½d.

A PERFECT TREASURE.

CHAPTER I.—HERSHELL POINT.

Most unfortunate persons are able to date their ruin from some trifling circumstance. The 'lifer'-convict, sentenced to years of seclusion till he gets his ticket of leave—looks back with regret on his first robbery with violence, laments the day when he stole his first watch, which perhaps was, after all, only that called a hunting one (on account of its fatal facility for 'running down'). If the poor fellow had but resisted the temptation to become its possessor, he might have sat on the bench (open to every British subject born with good lungs), instead of standing in the dock. Similarly, the wife of the French billiard-marker, once the flower of an English middle-class household, bewails that moment of indiscretion when she first returned from her finger-tips the clandestine salute of the self-styled Marquis de St Antoine, who lodged in the opposite second floor at Margate.

But why multiply examples? In every walk of life the fall can be traced to the first false step. I date my own condemnation to the literary profession from the day when I posted those *Lines to* ——, to the editor of the *Sandiford Mercury*, and he yielded to my importunity at last (for I had sent him many a poem before), and published them. All young poets write *To* ——, and all young prose-writers lay the scene of their stories 'not a hundred miles from L——;' whether from motives of delicacy, or because they have no superfluous imagination to spare for the invention of names, I am unable, at this distance of time, to recollect; but the practice, I now feel, detracts from the interest of their stories. One cannot feel very much wrapped up in either people or places who can only boast of an initial letter, such as the 'M or N' in the Baptismal Service.

Let me then here avoid that youthful error. My name and direction in full, at the period of which I write, was Marmaduke Drake, Esq., of Hershell Point, Hampshire; but I was not often addressed by that title, by reason of my tender years. I was more commonly called Master Marmaduke, and even Master Marmy, though this latter I resented as a liberty. Sangaree Tannajee, my uncle's Hindu servant (a most important person in this history), was one of those who invariably called me 'Master Marmy;' and in revenge I called him Sambo Whether I devised this term of reproach by some subtle process, such as is used by commentators, out of the word Sangaree, which was his 'front' name, or whether, dividing all mankind into two races, black and white, I dubbed him a nigger, I cannot recall to mind; but I know it made Sangaree Tannajee exceedingly angry to be called 'Sambo,' and that I often did it. I hated that Hindu with an intensity only known to boyhood, a period of life which resents difference of colour, of opinion, and even of taste, with ludicrous violence; and it is the fixed opinion of my riper years, that he, on his part, would have derived considerable pleasure from chopping off one by one all my fingers and toes, or roasting my juvenile carcass before a tardy fire. On the other hand, perhaps my imagination may have given his character a few uncharitable touches, inasmuch as he was my model ruffian, the lay-figure whom, in my youthful compositions, I invested with all the passions that defile the human breast: he was my 'Mongol of the Red Hand,' likewise my 'Gory Bandit of the Apennines,' which had appropriate scenery, borrowed from the really romantic features of the neighbourhood of Hershell Point. But for him there would have been no such creation as 'Wildred the Half-caste,' a supposed convert to the principles of the Church of England, but who only used them the better to conceal his designs against the family of R——, residing unsuspectingly in Bengal, but eventually massacred by the natives to the slow music of tom-toms. I mention these works because they are novelties: they were composed between my ninth and my sixteenth year, and have never emerged from the modest retirement of a somewhat illegible

Digitized by Google

manuscript. If any publisher, having effected his escape from Hanwell, should have undertaken to put forth the last-named romance, it would have occupied seven volumes quarto, and close printing too. Time was no object, at that period, with so much of it before me, and I did not spare my Uncle Braydon's letter-paper.

Perhaps a few words here regarding my uncle and guardian, as well as proprietor of the house and grounds called Hershell Point, would be only respectful, and cannot be considered out of place. I was an orphan, and entirely dependent upon his generosity, which was great, nay, beyond his means. It seems to me that there are no such uncles now-a-days. In our childhood, the world appears to be composed of parents, brothers and sisters, uncles and aunts, a great many cousins, and a few other people. It takes many years, unless we happen to be very poor, to convince us that the great majority of mankind are not personally interested in our well-being; and Uncle Braydon, whom I shall never see again, unless I get to heaven, took care to keep such knowledge away from me. He was not rich, but he lived upon his own property, and always led me to believe that that would one day or other considerably improve. How this was to happen, was not specified, but it was somehow or other connected with, if not dependent on, Sangaree Tannajee. He had been my uncle's servant in the East Indies, and master and man had seen stormy times together, which in some degree no doubt accounted for their close attachment.

Theophilus Braydon had been no covenanted servant of John Company, sitting quietly under the pagoda tree, while the rupees dropped into his open hand; nor had he as an officer idled his time away in cantonments, while ennui and the climate gnawed his liver. He had attached himself, in what capacity I never knew, to the service of Her Highness the Begum of Bundelbad, a native princess notorious for her wealth, her atrocities, and her partiality to Europeans. How so kind-hearted and agreeable an old fellow as Uncle Theo could have witnessed, far less endured, the tyranny of such an old harridan, for such she certainly was, used to excite my childish wonder; but I have since heard the whole story. He was offered a command in her very irregular cavalry. The uniform, in combination with his very handsome appearance, rendered him irresistible in the eyes of the princess so 'partial to Europeans.' Under pretence of his having a genius for accounts, of which he knew absolutely nothing, she made him steward of her household, and after a prolonged resistance, wedded him *vi et armis*, although she was nearly three times his age. I have a portrait of my aunt by marriage now lying before me, painted by a native artist; and certain therefore, if he valued his head, to be at least no unflattering likeness. 'Rich and rare are the gems she wears.' She has not, indeed, 'a human thigh-bone in her hair,' because she has not enough capillary attraction to sustain such an ornament, but she has a ring of immense value through her nose. Her royal features are of a maple complexion, upon which circumstance she prided herself exceedingly (most of the ladies of her court being of a mahogany colour); and they shine exactly like a dining-room table that has just been hand-polished. Her ears are of a truly regal size, the enormous weight of their rich pendants depressing them below her shoulders. She has 'as much gay gold about her middle as would buy half Northumberlee,' and I should imagine even the whole of it. 'Her feet beneath her petticoat like little mice peep in and out,' or rather they would do so if they were about a tenth of their size; as it is, they rather protrude than peep. The Begum of Bundelbad was, in fact, severely afflicted with elephantiasis. Except for these imperfections, she might perhaps have been a charming woman, but for the expression of her eyes, which was demoniacally wicked and cruel. It was her habit, Sambo once informed me, to cause all women whom she considered more beautiful than herself to be buried alive, their cries (see *Wildred the Half-caste*) being drowned by the noise of tom-toms. Fortunately, she was very conceited, so the occurrence did not take place so often as one would imagine.

In the military service of this Princess, as the steward of her household, and finally as her lawful husband, with the title of Maharajah, my dear uncle passed many years—the last ones, I fear, not altogether of honeymoon happiness. It was an ill-assorted union at the best. In friendship, difference of age is nothing:

> We talked with open heart and tongue
> Affectionate and true;
> A pair of friends, though I was young,
> And Matthew seventy-two.

But in love—my uncle being young, and the Begum seventy-two, for instance—this disparity became of consequence: there were earth-shakings, and then a final eruption and diaruption; many brawls, and one frightful blow-up, in which but too many innocent persons were implicated. After my uncle's escape, which he accomplished in the company of his faithful servant, Sangaree Tannajee, the irritated princess planted a whole garden with her maids of honour, dibbled them in in rows like scarlet-runners, to 'make them remember' (such was her bitter phrase) the fugitive soldier's escapade. The ex-maharajah and his much-reduced staff had to cut their way through some of his late subjects. His pension as king-consort was not, as you may easily imagine, continued after this occurrence; although, I believe, he did contrive that the quarrel should take place at the beginning of the quarter. But my dear uncle brought away with him much of what may be called his 'personalty'—as many of the costly presents which the Begum had showered upon him in her misplaced passion as his horse could carry; and it was with the proceeds of the sale of these articles—sufficient to stock a fancy bazaar—that Hershell Point was bought, and the maintenance of our household secured.

I do not for a moment pretend that any sentiment of affection for that abominable old Begum prevented my uncle's marrying again after her

Digitized by Google

death, or, for that matter, while she was alive. They had not been wedded in church, you see, or even at a register-office; that Bundelbad ceremony, consisting, as it probably did, in the burning of cedar chips and the burial of young persons alive, would not have held water in any English court of law; but his experience of the married state had been such as to determine Uncle Theo to remain a bachelor to the end of his days; and, fortunately for me, he stuck to his determination. 'I shall never marry, my dear boy,' he once observed to me. 'When I am gone, this little place will be your own, and I hope you will have a better income to keep it up with;' and then his eye would wander significantly towards Sangaree Tannajee pulling up onions in the garden, with an expression of countenance as though he was losing caste by the operation, and thereby consigning himself to perpetual perdition. It was impossible, in that moment of generous kindness, that I could ask my benefactor what that ill-looking old Hindu could possibly have to do with my future prospects; and when an opportunity did offer itself of putting this question, Uncle Theo, instead of replying with his usual frankness, returned an evasive answer. 'That Tannajee,' said he, 'is a Perfect Treasure, Marmy, and I would not lose him for ten thousand pounds.'

I have wandered from the relation of my literary pursuits, as I wander from all else, at the mention of that mystery of our household—that great, unintelligible Tannajee, whose story, to my mind, like Aaron's serpent, swallows up all other stories by virtue of its wonderful attraction.

Let me now endeavour to resume my own humble narrative.—I have said that I was a poet; nor was it to be wondered at that an impressionable youth, brought up among folks with so strange an experience of life as my uncle and his servant had had, and amid scenery so noble as that which surrounded our place of abode, should have acquired some romantic tastes, even though he should not have been born with them. I believe, however, that I was naturally endowed with something of the faculty divine of song, the germ of what might have ripened into worthy fruit, had sunshine and favouring breezes nurtured it to maturity, as they did at first. I think so now, but I felt quite convinced of it in the days of those *Lines to* ——. What golden days they were, from the breezy morn, when I arose and ran down to the shore, leaping from rock to rock, to the calm summer night, when I lay awake, watching the broad path of the moon upon the waves, and listening to their dreamy melody! Hershell Point was, as its name implies, a narrow headland, stretching far into the sea. Upon one side, the ocean lay illimitable, without hint of land, although the wizard clouds would often shape themselves on the horizon into wild mountain-ranges; but on the other it was bounded, although a great way off, by tall white cliffs. The sea-breezes never died, but whispered soft and cool upon the calmest day; and in the winter weather raged and roared, especially if they set from the south-west, like let-loose demons. The coast at that time (for a light-house has been set up since upon the very site of our cottage) was strewed with wreck on mornings after storm. The neighbouring burial-ground (there was no church), which, small as it was, would have sufficed for the needs of many generations of the scanty native population, was filled with graves of shipwrecked strangers. Many and many a time—as I have been walking on the golden sands, when the waves, after a night of furious passion, were glittering with ten thousand smiles, and breaking into laughter on the beach—have I seen, huddled up above high-water line, some shapeless form, which once was man or boy, and have straightway run up the 'cripple' path—the ladder cut in the steepest part of the cliff, but the shortest way to the village—to let the sexton know that he was wanted. The incident was too common to terrify me, but I had a morbid horror of such spectacles, and fled from them. Still oftener, in the dead of night, I have been awakened by the boom of guns, and knew that one of the vast fleet of ships which every day passed by us with their unknown companies upon their unknown way, would never complete its journey, but would give our coast its timbers, and our bay its dead. There was small hope for any vessel that once struck upon that fair but inhospitable shore, and especially at night. My uncle, kindly soul, never failed, however, to give his utmost aid. While I was still wondering whether I indeed heard guns or only the roaring wind, he would often enter my chamber dressed, and bid me hasten to the village, and bring what help I could, while the Hindu and himself went down to the shore.

It was to Hershell Point, from its position, that the news of such disasters was always carried first, for the hamlet lay inland. Although its people were mainly fisher-folk they obeyed my summons eagerly enough; I do not say from greed, nor yet entirely from philanthropy; their motives were mixed. They would save life if they could; but they would also save property, with the intention of keeping it for themselves. Their cottage-furniture, or at least what was best of it, was mainly provided in this manner; their upholsterers, so to speak, were Ship, Sea, Wind, & Co., who, moreover, dealt in miscellaneous goods of all sorts. At one time we were glutted with sponges, a cargo of which, from the West Indies, was discharged in this summary manner without invoice; at another, oranges and lemons bobbed up and down upon the surface of our little cove as plentifully as air-bubbles. Some sorts of goods suffered greatly in the process of delivery; but there was really no reason for the bitter complaints that ensued on such occasions, since we got them all for nothing.

Hershell folks had been all smugglers in the last generation, but in my time there was but little of that illicit commerce. The legends of 'the Free-traders,' as they called themselves, were probably more romantic than their deeds had ever been; and to know that a 'good run' had been effected in this or that adjacent cove, not without bloodshed, or that the great cavern in Sandcliff had been once a dépôt for brandy and lace, added to the imaginative attractions of the neighbourhood. Similarly, these wrecks were almost more terrible to think of—to be awake while those minute-guns boomed, and picture the calamity for one's self—than to witness; so little of them could generally be seen by reason of the fury of the waves and the force of the tempest. They were close at hand, for it was on the reef below the Point that they came ashore; but the blinding spray shut most of the sad sight out, and the thunder of the breakers drowned all other sounds. Feeble lights would shew themselves on board the doomed ships, only to be

Digitized by Google

extinguished by the next wave; figures running hither and thither, or lashed to the rigging, with tossing arms; and then, when some monster wave whelmed all, a single desolate cry, which, amid that elemental strife, sounded but as the whine of a seagull.

Such incidents, such memories as these, had something of melodrama in them as well as of pathos; and they impressed my youthful mind accordingly.

I had heard stories of peril and combat from the lips of one who had himself been engaged in such scenes. I had myself witnessed spectacles, any one of which might form the *pièce de résistance* in a full-grown man's reminiscences, while children of my own age were elsewhere digging sand-heaps with wooden spades, or hunting for common objects of the sea-shore with a pail and a magnifying-glass. It is no wonder, therefore, and no feather in my cap at all, that it might have been said of me at fifteen years of age that 'young Edwin was no vulgar boy.' If I had been so, I must have been born with such a natural tendency for the commonplace as to almost amount to genius. Books and magazines, which I devoured, were the only links which connected me with what is called the world. I knew nothing of what others of my own age knew—no Greek nor Latin, no cricket nor football. I had never been on horseback in my life—had never enjoyed a tuck-out at a pastrycook's. On the other hand, I could climb—not trees—for we had no trees to be called such, but cliffs, like a chamois-hunter; I could run swifter than that 'best pony in the country,' which belongs to every schoolboy whose father can afford to keep it; I could swim like a fish, and dive like one of those long-throated cormorants which haunted Hershell Reef at low-water. I lived in the sea and the open air. The martins who had their nest under the eaves above my bedroom window were my chamberlains to call me in the summer mornings, and I was commonly up and out soon after sunrise. It was a grand thing to have the world all to myself—not a creature on the downland above the cliff-top, nor yet on the broken ground, all rock and foliage, that lay between it and the beach; not even a sheep or a cow, as would often be seen later in the day, standing statue-like on the summit of some solitary eminence, clear cut against the sky.

It is only bird and insect life that are astir in the matin prime. How solemn, although vague and inarticulate, is the lesson that Nature teaches us at such a time in that great out-door school of hers—how different from what is preached and taught in chapel and seminaries! We seem to be like him of old who walked alone with God in the garden. It might be the first morning that ever was made.

I was not without religious culture; a loving mother had lived long enough to implant those principles in my childish breast which had made her death-bed (save for her solicitude on my account) like the setting off upon a pleasure-cruise; but besides that, I had the devotional impulse which belongs to the poetic temperament, and although quite unaware how the world looked outside my Eden, I felt grateful to Providence for having placed me where I was. My uncle Theo, despite his name, was no theologian, but he encouraged me to believe all I ever heard from my mother's lips, to do all she had enjoined upon me, and to cherish her memory. A beautiful loving face, with tearful hazel eyes, and soft brown hair, is all the picture; but it hangs in that portrait-gallery of the past, for which every earthly house not built with hands has room, the tenderest and best remembered still of all. I fear her history was not a happy one, but I am not acquainted with its details; she has long been at rest from all troubles, and reaps the promised harvest of God's golden grain.

I think it was her sorrows that first moved my uncle's heart towards me; he always spoke of her with inexpressible pity and tenderness. We needed his protection sorely; indeed, I have a dim recollection (although this may not be trustworthy) that we sought it of him at Hershell Point on foot; but, at all events, he had sheltered us both for years; and when she left us for the churchyard on the cliff, he filled her place towards me as well as he could, as also that of the father whom I never knew. Thus, in a vague and desultory manner, have I pictured the home of my boyhood and its surroundings, just as they recur to my mind, disconnectedly and vaguely enough, but not without a certain harmonious completeness too, like the chords of a harp struck by the wayward wind.

CHAPTER II.—MY FIRST LOVE.

Doubtless, other boys immured in school-rooms, and kept close to their books, would have gladly left them for such delights as mine; while, on the other hand, I, to whom all days were alike holidays, was intensely fond of reading. I do not doubt but that at sixteen years old I had read more English fiction and English poetry than any lad of my own age at public school or private. From Mary Ann Radcliffe to G. P. R. James; from Shakspeare to Tennyson—I had read all that I could lay my hands on. I had quite exceptional opportunities for this sort of study. In a certain little town six miles away (and yet that which lay nearest to us), dwelt one Mrs Eleanor Blunt, whose name was once a household word among all readers, although the present generation hears of it only now and then. She had built herself a charming little cottage close by the sea, all out of the proceeds of her works, and kept herself, an attached old maid-servant or two, and a pony and chaise, by her diligent pen. The knowledge of these circumstances had always excited in me the profoundest veneration; my enthusiasm was ready laid, like a housemaid's fire, so that it is not to be wondered at that when chance gave me an opportunity, when quite a small boy, of becoming personally acquainted with her, I fell in love with her at once. Our ages were more disproportionate than those of my uncle and the Begum had been; but my devotion was of a more Platonic kind. She had seemed to me to be like some celestial body seen afar, whose orbit was altogether beyond my humble sphere, although I was not without a secret hope that my literary talents might some day attract her sublime regards. I was always picturing for myself some success in literature which should bring Mrs Eleanor Blunt over to Hershell, to make the acquaintance of her gifted young neighbour, whereas our acquaintance was destined to be brought about in an altogether different manner. I had been strolling along our cliff-road so far as where it met the main highway, one afternoon, when I suddenly heard a jingling of wheels, and there flew by me a small vehicle, with a tiny old lady in it, drawn by

Digitized by Google

an audacious little pony at full gallop. Confident that a person of her age and sex could not be driving at this speed for a wager, and also perceiving that she was clutching the splash-board instead of the reins, I started in pursuit. I could at that time have run down an antelope (in the shafts of a four-wheeled chaise), so that it did not at all exhaust my energies to catch and stop the pony.

'Thank you, young gentleman,' said the old lady in a sharp squeaky voice: 'you have got good legs, and likewise lungs.' It was those personal qualities, then, and not my style as a British classic, which first drew forth Mrs Eleanor Blunt's approbation. I knew the famous old lady at once. The diminutive figure, the huge head, the snow-white locks, the bright, black, beady eyes had been made familiar to me by her portraits. I regarded her with undisguised admiration. Here was the individual who had won the hearts of an entire generation—nay, who had moved old and young alike to smiles and tears: she was the prose-poet of the country; the narrator of village joys and sorrows; the word-painter of woods and fields, and yet she had not appealed in vain even to the dull ears of fashion, but had filled the two greatest London theatres, and that at the same time, by her stirring dramas.

'Perhaps, young gentleman,' said she in a voice like that of Punch, but nodding very good-naturedly, 'when this gratuitous exhibition is over—when you have stared at me to your heart's content, you will just turn my pony's head round, and fasten his curb.—My dear little *Proudfoot* would never have run away, would he,' inquired she of the pony coaxingly, 'but that his curb came undone?'

The little creature (whose curb was quite as it should be) shook his head, snorted, pawed with his fore-foot, and answered, as far as pantomime could: 'Yes, I would, and I'll do it again.' It was quite impossible to misunderstand him.

'Madam,' said I, with my best air, 'it will give me the utmost pleasure to see you safe to Sandiford—to drive you thither, if you will permit me.' I had never taken a pair of reins into my hands in my life; but I could have driven a fiery griffin with packthread, for the chance of a *tête-à-tête* with Mrs Eleanor Blunt.

'You're a good boy,' said she, making room for me on the little seat, 'and a kind-hearted one too, to be so careful of an old woman. Just look to the traces, and then jump in. He's the quietest pony in the world when the trace does not get loose, and vex him—ar'n't you, *Proudfoot*?—Well, and what school are you at, my young friend?'

'I have never been to school at all, madam.'

'What a very lucky boy!' smiled the old lady. 'Never been stuffed with fusty, musty learning, eh? Never been caned? Never been kept in during the fine weather? Never learned to read, perhaps?'

'O yes, ma'am, and to write too,' remarked I with meaning, for I wished, above all things, to bring the conversation round to literature, and eventually to my manuscript works.

'Ah, that's bad,' said the old lady, shaking her head. 'Now, if you had learned to drive instead—you as nearly tipped us over that heap of stones as near could be—I should have liked you a great deal better.—What's that sticking out of your pocket? A book. Let me look at it! Shelley's Poems—and dog-leaved too! Oh, this is very bad indeed—*Alastor, or the Spirit of Solitude.* You read that, do you?—Give me the reins, young gentleman; I am not going to trust my neck to a lad of your age who reads *Alastor!*'

My boyhood had been, I verily believe, a tearless one, but I was within a very little of bursting into tears at this threatened indignity from hands I so revered.

Her bright eyes instantly perceived my emotion.

'I am a very uncivil old woman,' said she, 'and quite deserve to have my neck broken; but I mistook your character altogether, my boy, on account of your having such good legs and lungs. It is very unusual for folks to be strong and clever too, else the hippopotamus would be king of us all. A boy that could catch *Proudfoot* when at full speed—there's the reins under his tail; he's the quietest pony in the world, except when that happens—ought to be all muscles, and wind, and mischief. I thought you were all muscles, and wind, and mischief, and I apologise.—Now, tell me all about yourself. You have no father, of course; but you've a mother, who makes an idol of you, eh?'

'Alas, no, madam; I am an orphan.'

'Well, that's just my case,' said the old woman cheerfully. '*Proudfoot* is as near a relative as I have in the world. That means, you know,' added she in explanation, 'that I have got none; neither chick nor child. I had at one time a first-cousin once removed, but he has been removed altogether these thirty years.—Now, come, *you* are not so much alone in the world, my young Alastor, as all that comes to?'

'O no, madam; I live at Hershell Point with my uncle Braydon.'

'What! is the ex-maharajah your uncle?' exclaimed the old lady with twinkling eyes; and I saw that her fat little frame was convulsed with inward laughter. Doubtless, she was thinking of some gossip of the neighbourhood respecting the deceased Begum of Bundelbad; but I did not understand that at the time, and I did not like her laughing at Uncle Theo.

'My uncle is the best man in the world, madam,' said I with spirit; 'and if you have heard anything to his discredit, I will answer for it that it is a—that your informant, I mean, has been mistaken.'

'Say what you were going to say, young gentleman—say that it is a great big bouncing lie,' said the old lady approvingly. 'I like you for your sticking up for your good uncle, and telling me (by implication) that I was a scandalous old frump, a thousand times more than for your carrying Shelley in your pocket. A good honest heart, my dear, is better worth having than the most tender sensibility.' And from that moment, until her death, which did not take place for many years, Mrs Eleanor Blunt always called me 'my dear.'

She gave me a hearty welcome at her pretty cottage, which, although close to the outskirts of Sandiford, stood in a very bower of fuchsias and roses, all alone by the sea. But it was the inside of the little house that pleased me most. Upstairs and down-stairs, and (quite literally) in my lady's chamber, the walls were lined with books. Paper and paint were rendered unnecessary; the very doors were in some cases whole shelves of books that moved upon a pivot. They were almost all presentation copies. Indeed, I remember Mrs Blunt once telling me that she had gone into the town 'and bought a book,' with the air of a

Digitized by Google

person who had been guilty of an inexcusable extravagance. 'No, my dear,' she would squeak like a little white mouse, 'I have written too many books myself to buy such things.' But she was in reality a very glutton at reading, and it was a wonder how her eyes kept so bright and keen. She did not so much 'devour' books—a phrase which gives one some idea, however rude, of digesting them—as 'consume' them in broad acres, and with incredible velocity, like a prairie fire. It is true she never read a 'hard' book. The metaphysicians, to whom she would refer as 'gentlemen who did not know what to think,' stood untouched upon her top-shelves; the divines, for whom she had a great respect—'I would do anything for them except read them, my dear'—were kept in a glass case. Her especial weakness was for French Memoirs, such as those of Madame de Crequi, and even of much queerer ladies. 'They don't hurt me, my dear, but they might hurt you; and, therefore, never ask me for one of them.' But she was familiar with the whole range of English literature, and her memory was prodigious. She had met almost everybody who, according to my then standard, was worth meeting, and had something characteristic to tell of each. I am obliged to confess that she rather destroyed my illusions respecting some of them. She had the sharpest tongue that ever I listened to either of man or woman, and the grasshopper shrillness of her tiny voice added piquancy to her satire. She would often conclude a disparaging anecdote concerning some living literary idol of mine with: 'So don't believe in him, my dear, because, you see, he 's a rogue.'

'But you destroy my faith in all my heroes, Mrs Blunt,' I once remonstrated.

'Yes, my dear; but you must remember that I have been *valet de chambre* to all of them.'

I did not half understand her at that time; her wit was altogether too subtle for me; but I comprehended enough, when she abstained from epigram, to find her even then a most charming companion. She delighted in talk, and I daresay my simple enthusiasm (and perhaps I should add, my genuine admiration for herself) made my juvenile society very palatable to her. The good people of Sandiford did not much frequent Seaview Cottage. They were no great loss, from an intellectual point of view, perhaps; but I think the genial old lady would have enjoyed their gossip, had she been favoured with it. Unhappily, however, the activity of her pen had caused her tongue to fall into disuse. The Sandifordians having come upon certain very life-like descriptions of commonplace people in their local authoress's works, were seized with the idea that she had satirised them in particular; whereas it is my opinion that she never took a single 'character' from that place, nor did I ever hear her speak an ill word against one of her neighbours. Nevertheless, I was myself so prejudiced by what I heard concerning her Sandiford sketches, that when she expressed her intention of calling at Hershell Point on the ensuing day to tell my uncle what a perfect nephew he might have, if he would only teach him to drive, I blurted out involuntarily: 'But you won't put the ex-maharajah into a book, dear Mrs Blunt, will you?'

Then I saw her angry for the first, and almost the last time.

'No, my young friend,' said she in a voice like concentrated bitter aloes, 'I never pepper small game.' A remark, however, which peppered me, I remember, most uncommonly.

COLOURS.

The infirmity known as 'colour-blindness' is much more prevalent than one might suppose; and directors of railways, when selecting candidates for the posts of engine-driver, stoker, or signal-man, are often astounded by the number of candidates they find afflicted with it.

It will seem scarcely credible to those who have themselves good eyes, that three men out of five should be quite unable, at a distance of two hundred yards, to tell a green lantern from a red one. The most astonishing mistakes have been made in this particular. Engine-drivers who in broad daylight could see two miles before them down a straight line, and detect a paving-stone on a rail at fifteen hundred yards off, have been known to rush heedlessly by a danger-signal at midnight, and bring a whole train to destruction. And yet the glasses used in the red lanterns that signify 'Beware' or 'Stop,' are always of immense power, and, on a dark night, ought to be clearly visible to the naked eye at a distance of at least five miles. Similarly, sportsmen who attend horse-races or boat-races are often in doubt as to which colour wins, until the victors are close under their eyes; and this although the jockey's jacket may be of the most flaming hue, and although in other respects than that of colour-seeing these people may have excellent, unerring sight. A sailor who on the night-watch will find it quite impossible to say which glass is 'up' at Eddystone or Bell Rock, may be the first next morning to cry out 'Land' from the top of a shaking mast-head. When a mistake is made between colours, the error is almost always attributed to this peculiar obliquity of vision, and colour-blindness itself is said to proceed from malformation of the eye. But every rule has an exception; and there are cases in which confusions are made between one hue and another, without the eye of the seer being in any great way to blame.

Some years ago, a lady had ordered of one of the best house-decorators in Paris two varieties of paper for a villa of hers at Passy. She had imagined the patterns herself: one paper was to be crimson, with black *fleurs-de-lis;* and the other green, with pale gray figurings. The order was sent to the manufacturers, and the paper fabricated; but when the first samples were forwarded to Passy, the lady returned them, saying a mistake had been made. The fleurs-de-lis on the crimson were green, she added, and the figurings on the green paper pink. The shopman who was the bearer of the samples could not help telling his master that he was quite of the same way of seeing as the lady; and the decorator himself, as he examined the specimens, was fain to own that his order had not been executed. The patterns were accordingly returned to the manufacturers; but hereupon a dispute arose, for the latter swore by all the saints that the black they had used was of the deepest jet; and as for the gray figurings, 'they had mixed colours long enough,' they cried, 'to know the difference between gray and pink.' As the altercation was serious, an 'expert' was called upon to decide; and this he did by taking a sheet of white note-paper, and cutting out in it

Digitized by Google

some fleurs-de-lis of the exact size and form of those on the samples. He then applied the note-paper to the latter, so as completely to hide the crimson ground; and the flowers, which had seemed green, at once stood out in deep black. The experiment was repeated on the green paper with the same success: the figurings which every one had declared pink were shewn beyond doubt to be pale gray: and the lady, the decorator, and the shopman had to acknowledge themselves in the wrong.

A mistake of this kind would scarcely be possible now-a-days, for an upholsterer would take care to warn his customers in time, in the event of their giving him so eccentric an order; but it is not so very long since that the theory of the modification of tints by juxtaposition has become universally known, and even now there may yet be persons who have something to learn on the subject.

Here is an experiment familiar enough to school-boys: Take a square of scarlet paper or silk, and fix it upon a white ground; look then intently at it for a few seconds, and the scarlet will seem to have a slight bordering of green. Again, gaze fixedly at the scarlet square during half a minute, and then turn your eyes suddenly upon a sheet of white paper, an optical illusion will cause you to see upon the white ground a square of the same size as the red one, only of a pale green tint. The eye which has been looking at red invariably lends a green hue to whatever it may gaze on next; and, conversely, the eye which has stared at green, gives to surrounding objects a tinge of red. These two colours, red and green, are said from this fact to be *complemental* to each other.

In the same way, *violet* is the complement of *pale yellow*, *blue* of *orange*, *indigo* of *orange-yellow*; and the results predicted in the experiments with red and green will be obtainable in a similar trial with each of these pairs respectively.

One of the properties of complemental colours is to make up *white* by mutual blending; that is, that white light being composed of different coloured rays, when it falls upon an object, one portion of these rays is absorbed, the other rays are reflected; and the object appears to be coloured by these last. But these absorbed rays and these reflected rays would, if blended again, re-form the white light of which they are the elements; hence a second reason for the term *complemental*.

Let us say a few words now about those phenomena which have been technically called *simultaneous contrasts*.

It is admitted as an axiom that 'different colours always appear most dissimilar when placed side by side;' in other words, that the juxtaposition of various colours has the effect of making what differences exist in their respective tints stand out most strikingly. To illustrate this, let two skeins of wool be taken, of the same crimson dye and quite identical: let us term them C and C′. After this, let us take two other skeins of paler crimson dye, D and D′, and place them thus:

C C′D′ D

The two skeins C′ and D′ being juxtaposed—that is, touching each other—the skein C′, although of precisely the same hue as the skein C, will then appear darker than it; whilst, on the other hand, the skein D′, although exactly similar to the pale skein D, will seem to be lighter of hue than the latter.. Thus, when a dark tint is placed next to a light one, the dark appears to become yet darker, and the light still lighter; the dissimilarity between colours being always heightened by juxtaposition.

Here is a second experiment. Take a sheet of paper, and divide it into five compartments—1, 2, 3, 4, 5—and give to each a coating of Indian ink. When the ink is dry, give a second coating to all but the *first* compartment; after that, a third coating to all but the *first* and *second;* and so on to the end, until compartment 5 has received five coatings; compartment 4, four coatings; compartment 3, three coatings; &c.

At first thought, it would seem that the paper thus painted would have five compartments of different blackness, each separate compartment being, however, of a uniform tint throughout; and such, indeed, would be the case were the paper cut up into five strips, and each strip looked at by itself; but the effect produced by the juxtaposition of the five compartments is not by any means the same. Compartment 2, for instance, instead of appearing one-hued throughout, will appear to be of two different tints—that on the side of column 1 being considerably darker than that on the side of column 3; and similarly, compartment 4 will seem, like 2 and 3, to be painted with two shades of black—one dark, on the side next to 3, and the other light, on the side juxtaposed to 5.

Coming now to other colours, let us see what will happen if we place orange and violet, green and violet, &c. together.

Painters, it must be remembered, acknowledge but three prime colours—blue, red, and yellow. All other tints are compounds of these. Violet is made up of blue and red; green, of blue and yellow; orange, of red and yellow. In the case, then, of violet and green juxtaposed, each colour has one element, blue, in common. But this similarity on one point makes the dissimilarity on the others stand out more clearly, so that the green on the violet appears more yellow, whilst the violet, on the other hand, appears more red. In like manner, if orange and green be taken—the yellow element in the one cancelling, so to say, the yellow in the other—the orange will assume a reddish tone, and the green a bluish one.

The foregoing examples suffice to give an idea as to the law of 'simultaneous contrasts.' It remains now to be seen how this knowledge of the property of juxtapositions may be turned to good account.

One of the most laudatory things that can be said of a painter is, that he is 'a good colourist,' that is, that he knows well how to sort his colours. At first, this would seem to be no great praise, and the merit of a well-coloured picture might be thought to be principally with the tradesman who furnished the artist with his box of paints. But go some day to the Louvre, or the National Gallery, and watch a beginner copying a Raphael, a Reubens, or a Titian. What is it, you will exclaim, that prevents the man from copying the colours he sees before him? Why does he put pink where his model has put crimson; sea-green, where the latter has placed gray; orange where the 'maestro' has set ochre? If you consult the artist himself, he will tell you, of course, that it is not his fault; that Raphael and his compeers mixed their own colours, and that their secret has died with them. 'We cannot get colours like those now,' he will add dolefully; and not until some

Digitized by Google

years after, when he has become a 'Membre de l'Institut,' or an 'R.A.,' will he own that it was not Mr A. or Mr B.'s colours that were bad, but his own craft that was feeble.

A painter who understands his art, knows well that the science of colouring must form a long study of itself. A beginner who wishes to draw a soldier in a red coat and blue trousers, will naïvely look amongst his paints, and daub the tunic of his subject with scarlet all over; after this, he will single out Prussian-blue, and proceed in the same spirit to sketch the nether garments. When this is done, he will look at his work, and find round the rim of the tunic in contact with the trousers a slight edging of orange yellow, for which he had never bargained; and provided he have only put a few ochre spots on the soldier's coat in guise of buttons, he will be not a little surprised to find each of these encircled with a rim of verdigris. 'Make thy scarlet more crimson as it nears the trousers, O man! dip the end of thy brush in green to make the pantaloons less blue where they touch the coat; remember that a tinge of violet will do no harm to the yellow that is meant for buttons; and then, but not before, will thy soldier be presentable.'

When a picture is sent to the tapestry-maker's, to be copied in wool-work, the most ridiculous blunders are made, if the workman be not thoroughly skilled in the science of colouring. He will lay white and scarlet side by side, and marvel to find a green rim betweeen them. 'I can't make it out at all,' he growls. The foreman shrugs his shoulders, and holds out to him a skein of pale gray. 'Put this instead of your flaming white on the lines where the two colours meet; and instead of that glaring scarlet, take this dark pink to lay along the gray.' The workman obeys, and the green rim disappears. But elsewhere is a poor wretch trying to insert a ray of yellow between two lines of violet and black. 'What are you doing?' shouts the foreman. —'Looking for a suitable shade of yellow,' groans the well-meaning dunce.—'Let the yellow be,' is the answer: 'take your brightest violet and your deepest black where the borders touch, and the yellow will come by itself.' And so it does.

One might write a great deal on the subject of these pictorial blunders and the way to correct them, but we shall better employ our time by concluding with some practical hints and observations that may be useful to others than painters.

An upholsterer should be very choice in the colours of stuffs he adapts to different varieties of wood. It is a mistake to cushion a mahogany chair with scarlet. That colour is too bright, and the mahogany beside it loses brilliancy, and becomes like walnut-wood. Many people, however, who love the colour crimson, insist upon putting it with mahogany. In these cases, to counteract the glaring effect of the assortment, it is well to put a black or a green braid on the border, where the cloth and the wood come in contact; or if not this, then an edging of yellow silk, or, better still, of gold-lace with gilt nails.

Those who desire to paper their rooms anew will do well to remember that on red, crimson, and amaranth coloured grounds, *black* looks *green*. In the same way, black upon green loses all its lustre, and *vice versâ*. Orange upon red hurts the eyesight; violet upon blue looks washed out; blue upon green looks spinach colour by candle-light; and gray, as we have already said, when sorted with green, very often comes out pink.

It having become a custom now-a-days to print advertisements for dead-walls in all the colours of the rainbow, we may tell those speculators who are anxious that their puffs should be seen as far off as possible, that the rule to follow is, that in all cases the colour of the letters should be *complemental* to the ground on which they are printed. Black on a white ground, violet on yellow, red on green, blue on orange, will strike the eye at once.

A word now to gardeners.

Nothing is less brilliant than flower-beds in which the only colours to be seen are blue and white; nothing is more gaudily ugly than a garden stocked with a profusion of yellow and little else. It is very unsatisfactory also to find flowers of the same colour, but of different shades, placed near each other; and all these errors of taste should be avoided. In order that a garden may be showy and attractive, blue flowers should be placed near to dark yellow or orange; violet next to yellow; and red dahlias, roses, pinks, and geraniums should be surrounded with verdure and white.

We shall perhaps astonish Rifle corps on the look-out for a uniform, by telling them that the uniforms which last longest are those that offer the greatest contrasts in point of colours. The uniforms that last shortest are those in which cap, tunic, and trousers are of the same colour. Some riflemen are in the habit of wearing their uniform trousers and cap when off drill; this is especially the case with those whose uniform trousers are gray or whity brown, and the harm is not great where the uniform tunic is of a different hue. But too often it happens that the whole suit is alike; and then the valiant rifleman, when he dons his tunic for parade, is quite astonished at the queer look his trousers have. He has been wearing them perhaps every day, because he likes them, and thinks he looks well in them; but the tunic the while has been lying in a drawer, and the consequence is, that when dressed for drill, the Volunteer's coat looks spick-span new, and his trousers, by contrast, outrageously shabby.

The most showy and most durable of uniforms is the scarlet and green, with silver, not gold lace. The smartest and at the same time most suitable and lasting uniform for a rifleman would be a light gray tunic, with bright green collar and cuffs, double row of silver buttons, and green beading round the edges of the coat; green trousers, with a stripe of paler green; and gray kepi-cap, with green band and slight edging of silver. Such a uniform would look bright and new until it were worn threadbare.

Ladies, of all persons, are most bound to use taste in their selection of colours, and we must do French women, in particular, the justice to own that they usually dress to perfection. English women, of late years, have made progress in the science or art of the 'toilette.' But still some grievous mistakes are at times committed on our side of the Channel; and it would be well if young ladies who study drawing would at times consult their masters on the delicate subject of blending colours.

Let fair-haired beauties abstain from pink, a colour which makes them pale. Let dark-haired maidens take that colour, and remember also that no hue suits *them* so well as saffron. No colour

Digitized by Google

is so well suited to chestnut hair as lapis-lazuli blue; and the *bleu d'azur*, the *Eton* blue, as it is called in London, is the true *parure des blondes*.

SAVAGES I HAVE KNOWN.

Let me first make a careful distinction. There are savages of civilisation and savages of real savagery; it is of the latter class I would endeavour to record a few sketchy reminiscences. Many persons, of delicate perceptions and estimable character, feel no scruple—rather a great inward contentment—in applying the epithet 'savage' to each and all of their friends who fail to catch the divine excellence of Mr Rossetti's colour, or the celestial harmonies of Mr Whistler's Japanese views of Chelsea, or the majolica of the Marchese Ginori, or the views of Comte and Charles Fourier, or, in fact, the merit of any curious craze which chances to meet their own approval. Not that I myself sit in judgment upon any man's hobby, or venture to declare an admiration or an antipathy on any subject of art or philosophy whatsoever. As one who has lived much, travelled far, and seen many lands and several cities, I have learned to respect the ideas of men, and to wonder in silence where I cannot agree; I have learned also—or flatter myself in so thinking—to waive the expression of my views upon a subject which I do not understand; though views a reasonable man *must* have—whether he know much or little, or nothing at all—upon every subject. Therefore, wiser in this respect, as I love to think, than the pastors of the daily press, I will leave in peace the social and artistic barbarians who swarm, as we are told, in this our native land, and tell only my experiences of the real, unquestioned, conscientious savages who have crossed my wayward path in the odd nooks of this big world which I have girdled.

How the memories come back to me! Memories of laughter and of fear, of downright, honest, side-splitting mirth, of deadly danger, of pleasant 'camaraderie;' memories of lonely wood and sunny river; of camp, and hut, and ruin; every recollection intensified and warmed by a flash of glittering eyes, brown limbs, and honest, manly, wondering faces, pleasant to recall. For I strive to dwell upon my savage *friends* only in these retrospective visions. Too much, I think, have we heard of the horror and ferocity of simple nature—too much, perhaps, do we know; I might tell stories, like another, of the bad men one meets in this land and that, but it is not my wish. Let the recollection of a child's evil habits die with its growth; let us remember only the little one's funny ways—its drolleries and quaint innocence; lest, since the sins of men are writ in brass, while the good 'is oft interred with their bones,' we come to hate and dread the whole generation of children, because, from ignorance, they are cruel now and then; from ignorance, are treacherous; from ignorance, unteachable. I think it is the devoir of every Christian man to speak lightly and kindly of those who are to him but as the beasts that have no revelation, to guide them with his knowledge. And if, by good or bad fortune, he have wandered much among the darker places of the earth, and have gathered unusual knowledge of those who dwell therein, he should not, for a small self-glory, magnify the horrors of his sojourn, but rather point out the good that lies hid in the dim and obscure nature of the savage.

I will take in order the best types of the child-man whom, by good-fortune, as I count it, I have had the opportunity of studying. I will begin in Africa, pass on to Asia, return by Europe—where there is still, as I shall shew, a real, unintelligible, naked savage of savagery—and thence across the wide Atlantic to America.

He must have been a very Lavater, a Morton, a Gliddon, or a Thurnam, who at first sight had recognised Hassan Beni Something as a savage pure and simple, as in truth he was, and, if yet alive, is, I doubt not, still. He was the earliest type I met of this great family, and even yet the most incomprehensible to me. There are many in England who will recognise handsome Hassan; nay—for I think he reads English—it is not impossible that he will recognise himself in studying the back numbers of *Chambers's Journal* in some sweltering calm upon his native Nile. For Hassan is, or was, a dragoman, and a favourite with dukes and earls, and Englishmen generally, whom he has safely piloted along the glorious river. Should he see this notice of himself, I know it will not offend nor move him, as you shall shortly understand.

I first saw Hassan in the veranda or porch of Shepherd's Hotel, when, almost a boy, I set forth upon my travels. Seeing him there, with his beautiful face—so soft in colour and feature, so spirited in expression—with his graceful form wrapped in the joyous costume of a wealthy Arab—Nizam jacket of brown satin, sapur or waistcloth of Persian gold-work, trousers of purple silk, and tarboosh swathed in a handkerchief brighter than flowers—I stood and gazed, being yet fresh to oriental types, and thought that the more delicate style of manly beauty could never by possibility find an embodiment more exquisitely perfect. I spoke to him, and he answered in good English, but with a tone, not disobliging perhaps, but tinged with a certain assumption of superiority, which I did not then in the least comprehend. While we talked, some ladies galloped up the wide and dreary street from Boulak, and halted their donkeys beneath us at the steps of the hotel. They were fresh young girls, rather noisy, very red and hot, having perhaps something more than the average of healthy strength in their limbs and of loud mirth in their voices; but why, I wondered in innocence—why did Hassan draw together his fine eyebrows so very darkly? and why did he spit over his shoulder in that spiteful manner? Seeking the clue, I led our conversation to the topic of native customs in regard to women; but Hassan grimly remarked at once: 'Sir, we poor Arabs have a proverb: A man never talks of his treasure till he has lost it!'

I pondered this oracle for a while, and failing to see its meaning—though dimly conscious that some very fearful rebuke was contained therein—boldly inquired whether so handsome a fellow had a wife, or two, or a dozen.

Hassan gave a sudden start, spat furiously, and with trembling fingers, snatched a document from his belt. 'There, sir,' he said, thrusting the unintelligible characters under my nose—'Hassan Beni Something is a dragoman, licensed by the pacha. He's no slave of yours!'

Half-laughing, half-remorseful, I soothed the fiery fellow; and, in a stately manner, he agreed to pass over my offence.

After this, accident threw me a great deal in

Digitized by Google

Hassan's way, and I had full opportunity of studying a character of the East which we in England know nothing and think nothing of. The handsome dragoman was a passionate fanatic for his religion; and though scarcely twenty-five years of age, I suppose, could already boast of two conversions. He knew the Koran by heart, of course; and not the Koran only, but a dozen minor prophets of his creed. Finding me very inquisitive, and a capital listener to his marvellous tales, and philosophy not less marvellous, Hassan entertained sanguine hopes of rescuing yet another soul from the devil's claws. I did not know until afterwards what overpowering ambition it was which made the fanatic so tolerant of my continual offences against his code of ethics, many of which, I fear, were committed in pure mischief; but twelve months after, I was assured, on authority not to be mistaken, that prayers had been offered, and hopefully too, on my behalf, by no less a person than the chief dervish of the college at Boulak, my very good friend. It is not every man who can boast that his welfare was so much a care to strangers; and even now, I feel no little pride in thinking that an old man, good and sincere, should have prayed for the safety of my soul, though it were to a false prophet.

But to return to Hassan. One by one, not without difficulty, I drew out those wonderful opinions and beliefs, the discovery of which leads me to class this most elegant of dandies, the favourite of peers and princesses, among the very grossest savages in my long list. His philosophy was of the simplest, and may be thus stated: This world was created perfect and holy by Allah; every change, spiritual or physical, that had since altered the face of things, was contrived by the influence of Shaitan: therefore were the nations most advanced most sinful.

'See,' Hassan remarked to me one day at the railway-station in Cairo—'see the devil's sign in this your greatest invention! Fire is his emblem and chief agent; smoke is the token of him; noise and confusion his invariable followers. Are they not all here for a witness? Your railway-trains and your manufactories are taking you all to perdition, sir!'

'Bravo, Hassan!' I replied. 'Yet you do not disdain to profit by our condemnation.'

'I am holy, and the devil serves me,' returned the dragoman with the calmness of conviction.

This was hopeless.

'How can you consent to be a servant of Infidels?' I asked one day.

'I trust that the sight and contact of a believer may turn their wretched minds,' he replied. 'And I thirst to see the holy place at Mecca.'

I was somewhat struck with a remark he made in answer to my inquiry: 'Would you die for your faith, Hassan?'

'Yes, sir. I would *fight* until I died a thousand times.'

Sometimes—when his hopes of me rose to a sanguine point, I suppose—Hassan even spoke about his family. 'How many converts have you made?' I asked.

'Two, sir. There was a girl also.'

'A girl? Who was she?'

'An Abyssinian slave, sir, whom I bought and married. The white ladies at Alexandria had taught her their false religion, or enough of it to turn her head. I converted her to the truth. She is now devout, as far as a woman can be so.'

'And how did you convince the girl? Did you beat her?'

Hassan gazed at me steadily, with that oriental calm which is the substitute for a Frenchman's shrug, an Italian's 'che!' or an Englishman's loudly phrased disgust.

'You did not beat her? Did you argue with her, then? No? Of course not! A girl! How was the result effected?'

'I told my women to convert her, and it was done.'

'How?' I insisted with boyish pertinacity.

'She is a very good and pious Mussulman.'

'But how did it come about?'

The rare and soon-veiled glance of humour came to Hassan's eyes. 'I don't know,' he said; 'I didn't ask; but—I saw a large pin lying about when I returned home!'

'And with what instrument did you secure your other proselytes? A thumbscrew? There's a good deal of business done hereabouts with a common ladder, I've heard, or even with a bucket and a wasp's nest. Which is your favourite tool for converting folks?'

'Sir,' replied Hassan with dignity, 'I have told you the other two were *men!*'

Yet this strange fellow had supported his stepmother in idleness for many years, and had pinched himself to marry his sisters respectably, and to their own wish.

I bade adieu to Hassan among the mud-built huts of El Luxor, firing a last shot at his philosophy as I turned towards the Nile. 'See these mighty ruins,' I said, 'built by pagans; see these kennels of the true believers built among them. If, without sin, you may command the devil, would it not be well to set him at work among your brethren?'

'Nay,' replied the fanatic; 'for there are weak hearts even among the faithful, and to tempt them would be unpardonable sin. I rather pray daily that the Infidel arts may perish, and the world grow pure again!' Clearly, a hopeless savage, but honest and kindly as he was handsome.

Of a very different type was the second example I shall select from a crowded *répertoire*. A worthy man he was, dwelling in the depths of a Bornean forest, in a house overshadowed with pénang palms and 'lancet trees,' thick with acid fruit; a very old man, with the face of a sheep expiring from mental affliction, the form of a gander suffering from atrophy, and the costume of primeval man after the Fall. He sat, when I first caught sight of him, upon a log, in a deep green shadow of giant trees: the expression of his innocent face shewed deep perplexity. Between his naked and distorted feet lay a basket of stained ratan, filled and overflowing with fragments of cloth, tiny bells, boars' tusks, alligators' teeth, dry seeds, deer-horns, threads of wool, and knotty twigs. Over these valuable 'properties' the old man was pondering, much harassed in mind by the incurable stomach-ache of his 'orang kaya,' or chief. For this typical savage of mine was a 'manang,' a medicine-man, a conjurer, thief-catcher, devil-fighter, of some eminence among the worthy Undups, as his tribe are called. Straightway, perceiving him thus occupied, and warned by my Malay guide—not without some awe, though the laugh of orthodox scorn rang out very clearly—what was the profession of this forest-born practitioner, I addressed him with spirit, and was

Digitized by Google

answered in all politeness. Would I could render the terms of our conversation with the simplicity and humour which no doubt they carried; but, alas, the manang's voluble tongue spoke no intelligible dialect to me, and I myself was not yet so conversant with Malay that I could even talk with my interpreter first-hand. But somewhat in this manner our discourse proceeded, as I am told:

I. Ask the old fellow what he is doing here, Ali.

Interpreter. The lord who eats at the rajah's table asks why you are not at your unimportant work in the rice-fields, Infidel.

Manang. I am praying for the safety of my lord.

Interpreter. He say he make charms for have you brave and lots of wife.—That a lie, Tuan!

I. Ask him what are those odds and ends in the basket there.

Interpreter (directly). Oh, them be dam rubbish, Tuan—what he make medicine of, to doctor fools when they sick. All nonsense and dirty rags, Tuan!

I. Ask the old man.

Interpreter. The lord who sleeps in the rajah's bed condescends to inquire what you mean by collecting such infernal bosh as that basket contains, Infidel?

Manang. The lord is very kind to his slave.—These are the evil spirits I have extracted from my numerous and deeply grateful patients. They have great power to cure the sick, to drive out the best-born devils, and to insure good harvests. They are the chief treasures of the Undups.

Interpreter (with wrath). O infidel dog, Dyak cow! Will you repeat your mummeries before my face? Will you insult the meanest follower of the Prophet? Will you—will you'——

I. Easy, Ali! What does the old boy say?

Interpreter. I say he a pig, Tuan!—a dog, a foul Dyak sorcerer! He know our holy faith; and instead of that, he stick like gum to his bits of bone and feathers! He go to perdition—you go to perdition, old Manang!

Manang. Whatever my lord wishes. I pray for him and all his servants.

Interpreter (at white-heat). You pray for me! You pray for me! you cotton-headed, pénang-sucking, white-toothed, raki-swilling old impostor! You Dyak djour, that will never see heaven—that has no heaven, nor any Allah, nor spirit, nor future life! You pig, that will sink into the earth as a stone sinks, nor ever be heard of or seen again in the other world! You pray for me to your lumps of wax and bits of bone! Allah, that made me, knows how I would crush the life from your old carcass, were it not that my lord, who leans upon the rajah's knees, and is weak in his poor English head, condescends to take notice of you. Yah!

I. Hold your confoundedly orthodox tongue, Ali! How are these things used?

Interpreter (sulkily). The lord who is acquainted with the rajah's wife by sight, asks what are your confounded games with this rubbish, Infidel?

Manang. Tell my lord these are great secrets. Tell him that they cure the sick, and bring good luck upon a house. Tell him they are mysteries incomprehensible; and their result, when properly used, is infallible. With them I can destroy my enemies and heal my friends, rain storms, bring rain or sunshine, sink ships, win battles, cause success in head-hunting and the chase. I can do anything—anything. And if the lord be pleased with his slave, good Ali, ask him for a little English medicine to cure the fever that is burning me up—a little of that bitter stuff the 'orang putih' use. I am very ill.

Interpreter (with innocence). The old man's charms, he say, good for anything, and play the dobbil. He want a bit of quinine to cure his ague. Don't give him any, Tuan! He very wicked!

Wondering which was the bigger fool of these two, I went my way through the shadowy forest, all unconscious at the time that I had been introduced to a character of no small note among the simple and superstitious Dyaks. Months after, I was thrown for some time in the company of this medicine-man, and expended much time and ingenuity in the investigation of his real belief; but to this day I cannot tell whether he had faith or not in that strange medley of rubbish which contained his pharmacopœia, his ritual, dogmas, and vestments.*

Returning to Europe, with the half-mournful thought that I had done with savages and savage life for ever, I found myself, one bright and windy Christmas-day, beating back and forth across the mouth of Porto Torres harbour. Do you, O reader, know in what hole or corner of our continent to seek that ancient refuge? Though you be a brother member of the Geographical, I will wager all my 'traveller's tales' you never so much as heard of it. Porto Torres, gentlemen of England, is the northerly harbour of that beautiful island called Sardinia. The granite cliffs which scowl or laugh across the ever-restless sea, the massy walls which gird the island round, gape suddenly at this spot, and leave a narrow and most perilous channel into a tiny bay. No other ports exist, or ever will be formed, probably, on this end of the island. Porto Torres at the north, and the glorious Bay of Cagliari to the south, are the only breaks in the natural defences of this coast. I landed, then, with a gay company, determined to explore the innermost recesses of a land less known to Europe than many a barbarous realm of the antipodes. At my first step ashore, I admired the stately column, standing all alone these thousand years, which still bears witness for Greek art and Roman power; wandering up the street, I admired the countless fragments of temple and bath, column and statue, which now build up whole walls of field and hut. And as I passed beyond the tiny village, I vented my soul in marvelling at masses, piles and hills of ruin, which record the existence here of a city covering miles of ground—I passed beneath colossal archways yet erect, and climbed along Cyclopean walls yet standing—walls older than Rome, older than Athens, old perhaps as the hoary pyramids themselves.

Amazed and bewildered with the discovery of such marvels, feeling somewhat as Stephens may have felt among the ruins of Palenqué, I took my way back to the port, revolving a

* Whether the manang could cure others' sickness—he who could not cure his own!—may with reason be doubted, but I had abundant and unquestionable testimony that he was guaranteed by some means against reptile poison. The Malays assure me that this security is produced by inoculation of the venom in different parts of the body; which may be true. The same practice obtains in America.

Digitized by Google

communication to the *Times* or *Athenæum* that should startle a blasé world—which communication was never written. But let me tell the antiquarian reader that such treasures of his favourite seeking are to be found in the island of Sardinia as never he dreamed of. Now and then, as the archæologist will remember, gems of art have been brought to England from this soil—Etruscan, Greek, Roman, and Saracen. The priceless scarabæi, which link Egypt with Etruria, the great Greek glasses, a thousand of the most valuable and curious antiquities in our collections, come from this wealthy but most miserable island. Yet I can assure the antiquary that scarce one discovery has been made except by accident; or if there ever were attempts at scientific search, they have long since been abandoned, and dwell not in men's memory. I myself, in such huts as I shall presently describe, have seen vases and urns, bronzes, coins, and household instruments, such as would bring beyond their weight in gold at the dealers' shops of London. None care for them there—they are too common. Nor are the remains of temple and palace less frequent or less interesting. But I dare not dwell upon this fascinating subject.

From Porto Torres—where there is no inn—I took a rattling diligence, which thrice a week traverses the sole road in the island, between Cagliari and this northern harbour. These are indeed the only towns, and they lie something like a hundred miles apart—rather more, if I remember right. Having before us a journey of many hours, we proposed to take the whole inside of the conveyance; but the clerk, with rare honesty, assured us that this expense was quite unnecessary: 'There are never any passengers, signori—never, never!' he said with emphasis. At a certain village, whereof I forget the name, we left the diligence, and demanded our guides and horses. They came after a while; and in the white and glimmering haze of dawn, we set out in search of a very Nimrod, a mighty hunter, who dwelt a day's journey off among the pine-forests. I have not delayed to speak of the scenery, nor of the strange folks who people it; suffice it that the land is lovely, and the inhabitants hideous. One league from Porto Torres, five from Cagliari, thrusts the Sardinian traveller into the middle ages. Thus were our forefathers six hundred years ago, in costume, in habits, in thought, in everything but speech. And what a marvellous speech that is of the savages! Neither Italian, Spaniard, nor Arab can comprehend it, so ingeniously have the elements of these three languages been hashed up with a seasoning of pure rigmarole. The Maltese, whose Arabic is almost as barbarous, get on best in Sardinia; but the quantity of Spanish and Italian words are just sufficient to confuse the predominant dialect. How little is known, even by their nearest neighbours, of this strange people, will be apparent when I mention that in Italy every one assured us their national tongue was generally spoken, or at least understood, throughout the island—whereas the fact is, as we found at our expense, not one person in five hundred has any knowledge whatever of Italian, or any other language except this bastard Arabic. Let me get to my savage, however—though, indeed, none can avoid digressing in Sardinian travel; for the plains are uncultivated, except around paltry, mud-built villages, which, were it not for the vegetation, one would swear were Kaffir kraals, or Fellah huts. Where this trifling agriculture is not seen, the ground is covered with a bush-like rhododendron, which, at Christmas-time, spreads a sheet of purple blossom over the plain. Rides, smooth as though trimmed by unseen gardeners, intersect each thicket of the cover, and by these natural paths one winds across the level. Partridges whirl up each instant, pigeons rise in clouds, woodcocks and snipe twist aloft from the pond-banks; now and again, with a mighty clashing of the boughs, a whirlwind of flying leaves, with grunts, and cries, and snapping of teeth, a herd of hogs dash along the path; or a huge red boar, with tusks fresh ground, with lips apart, and little eyes all fiery, trots over by himself, glancing at the intruders, as though undecided whether to pass or to attack. Sometimes, no doubt after domestic troubles such as rouse his lordly nature, he *does* charge, and then ——

Have you ever been attacked by a wild-boar? Have you stood all alone, with empty rifle and griped spear, before the forest-king? I have—by night on the golden beach of a far Eastern sea. He fronts me, black and terrible, beside the creeping water, a horrent mass against the spreading halo of the moon. By day, too, I have faced him, in a wood dazzling with the keen tropic light. The brilliant pencilled sun-rays sprinkle his dismal head; his small eyes burn with spite upon me, and seem verily to laugh with triumphant malice. See, see! The rigid bristles of the neck tremble and heave in an agony of rage; the big teeth snap, their foam falls on your face. He has gathered breath. He comes! Now grasp the spear tight, and bend to earth and pray, for rarely in this life doth one face deadlier risk than the charge of a black Eastern boar. That scream!—that ponderous rush! A sudden weight dashes me to earth, while the sun-flecked trees spin round, and the bamboos tear my flesh. I leap up; I dash the blood-drops from my face. Hurrah! The boar lies prone, with a good lance buried to the cross-bar in his heart! Rejoice, comrade, that neither you nor I as yet have felt that deadly sickness, of a pulse-beat's length, which comes o'er the doomed shikari, as his lance-point slides along the leathern shoulder of his foe. For him is no help in the cruel, sunny forest. Too many tragedies the flowers see, too many sudden fates, too many cries of agony they hear! The birds will twitter, and the gemmed flies dance, though a man's body lie in fragments underneath the trees. None will hear your groans, if life remain; none give you aid, while the last gurgling breaths escape your throat; nay, but a thousand tiny foes will set upon you, more cruel far than that brave old boar, who long since has crashed off, triumphing in his vengeance, through the brushwood.

These digressions are intolerable, but forgive them, reader, to an overflowing memory! I will sin no more.

Two days after leaving the diligence-road, we reached the pine-forests, and here I straightway lost, first my guide, and then myself. I rode for some hours in no small anxiety, being already aware how few were the paths, and how scant the population of these hills. It was almost sunset when I struck a path which led me to a little clearing, where I encountered my European savage. And do not suppose that he was an exceptional character of the region; on the contrary, I saw many worse specimens, and few better, of the

Digitized by Google

human race, in my Sardinian wanderings; but I select him for portraiture because the *mise en scène*, the properties, all about him, were so exquisitely perfect on that first introduction. The clearing had been evidently a Roman mine two thousand years ago. Walls and pits still remained to shew its former use, and more than one of the ruins might have been made habitable by the mere addition of a roof. This style of dwelling, however, is not to the taste of the Sardinian savage. He prefers to select a piece of level ground, which he encloses in walls of timber, like a bear-trap. When the square is complete, he roofs it in with sticks, and moss, and heath; *then* thinks of providing a door and a window. These necessaries are produced by cutting two holes through the walls, and tying the intersected beams firmly together. After entrance and light are thus provided for, he grubs up the turf and bushes *inside*, flattens the ground, puts in a log for a seat, and another for a table, stores his gunpowder in a nook furthest from the usual hearth, and goes out to seek his sustenance among the boars and roebucks of the forest. Their flesh feeds him, their skins make his bed and clothes. If he have a wife, she spins a little wool for under-garments; if he have none, the sale of game from time to time—at one halfpenny a pound for boar's flesh, one penny for venison—supplies him with all things needful. The agricultural instinct is sometimes indulged in a tiny field about the size of a child's garden; more frequently it is not indulged at all; and a porridge of chestnuts and wild vegetables satisfies the moderate desire of change in diet which the savage knows. From week to week he sees no one, except perhaps the wife and possible family aforesaid; he speaks to none except his dogs, or maybe himself; he knows the iron mines, and sometimes smelts a little ore in winter evenings; he knows the silver mines, ay, and the long-lost veins of gold, but rarely turns his knowledge to account; he gathers carbuncles and turquoise, which he barters for powder and spirits; he goes to mass at Christmas, and there confesses his sins, which seem to be more heinous than appears, at first sight, possible; he knows no sin, nor any good, and is as skin-clad, senseless, brutal a savage as in all my wanderings I have seen.

And thus I found him employed, as I rode up the long shadowy aisle of firs that made an avenue to his dwelling. He sat upon a log—a tall, bearded, muscular fellow, not without some remains of that earnest beauty which Moorish ancestors have left to his race at its fairest. His body was enwrapped in a jerkin of wild-sheep skin, the dark-brown ridge of the animal's back falling along his spine, and its white belly clasped across his chest. There it was secured with vast buttons of silver, hanging each by a little chain. Through holes at each shoulder, the wiry arms emerged. His drawers, immensely wide, were of home-spun wool, not white, as is the national fashion, but of a coarse blue; these were tucked tightly into leggings of wild-boar hide, which, as I afterwards discovered, were the real skin of the animal's legs, stripped off uncut, and fitted, while still soft, to the limbs of the human brute. The occupation of my savage, when I discovered him, was beautifully harmonious; he was breaking up a 'muffloné,' that rare animal, which now only survives among these mountains. Around the carcass, with eager eyes, crowded a pack of dogs, fat and handsome enough, which fought for the morsels flung from time to time among them. Suddenly, their master thrust his reeking arm into the carcass, and produced a gory mass—Heaven knows what dainty! This he balanced for an instant in his hand, then, with some harsh call, tossed it into the air. A child, yes, a girl, suddenly bounded up from her couch upon the ground, and caught the precious prize before it fell. She laughed with glee—I saw her and heard her!—and straightway, pressing the horrid streaming object to her naked bosom, vanished into the house. And simultaneously, all the dogs caught sight of the intruder, and dashed at me.

The savage rose hastily, and snatched up his long gun. I made signs of friendship, and drew near. He called off the dogs, and welcomed me without a word, yet in a manner not quite devoid of that grave courtesy which his darker brethren practise. I asked for food in the French patois of Corsica, in Italian, in Spanish, and lastly, in Malay; he understood not a whit, but resumed his seat for greater convenience of staring. I made signs, and at a call the horrid child emerged again from her retreat, and, with a fearsome bashfulness, approached. The savage gave me to eat—I know not what horror. He sat with his long gun between his knees, and watched. It grew dark. I recalled my Arabic, and asked for a bed. The dreadful child took me within, and pointed out a pile of deerskins. The savage followed us after a while, with his gun at the 'order.' Inspirited by his example, I clasped my rifle between my knees, and lay down, as many a time had I lain in less dangerous company. Less dangerous? Not so! I will bear peril with any man and cry not, but—horrible insects—in my bed I cannot endure! For a time, I reasoned with my nose, my gorge; finally, with every inch of skin upon my body; then I arose and sallied out cautiously. At the instant they were on my track, the savage and his whelp—one armed with the inevitable gun, the other with a knife. Ah! but the moonlight was glorious without, streaming down in snowy flakes through the wide branches of the pines, lighting up those sculptured witnesses of a grander time which lay around the hovel.

I paid no attention to my host, but leisurely selected a dry spot beneath a pine, threw myself down, and slept with one eye open. And at midnight came my friend, with both the guides; and he fired his rifle over me, to rouse the savage. For behold, all unaware, I had stumbled on the abode of A'hmari, the greatest shikari of Sardinia, of whom we had been in search. He was a savage of savagery; and, such as he was, is he still, I doubt not. There is no reformation, no hope nor chance, for such as he.

This paper grows too long, or I would gladly cross the Atlantic with my reader, and portray for his instruction the various types of American barbarism. One word more only; a word I have wished long to utter, for the benefit of English sportsmen and travellers. Go to Sardinia, you who love shooting, and are not afraid of hardship. There will you find feathered game thicker than sparrows in England; there will you find roebuck and wild-boar in such numbers that your very arm will ache with slaughter; there, with luck and skill, may you once, or even twice or thrice, stand over the carcass of the glorious muffloné, and boast of the moment to your dying

Digitized by Google

day, seeing that almost every head of the noble beast still surviving is numbered and known among the foresters.

If you be an antiquary, go to Sardinia. If you be a miner, a philologist, go to Sardinia, for there are fortunes in its rocks, and fame in its unintelligible tongue. But if you be not stout and sturdy, withstand temptation, and stay at home.

OLD LONDON LIFE.

From time to time, in some dusty old folio, one comes across a bird's-eye view of medieval London, half-picture, half-map. We are become familiar with the labyrinth of streets and lanes, with the masses and blocks of quaint old houses, tall and narrow, as if jammed between the river and the city walls, they had struggled up towards the sunshine from the smoke and gloom below. And, standing out clear from the mass, we see the tapering spire of old St Paul's as it used to be; the solid strength of the towers of Julius, much as they are now; and old London Bridge, with the swift tide tumbling in cataracts past its wooden piles. But of the people that swarmed in that warren of human life, we have the vaguest possible notions. We learn that St Jackins and Gramercy represented the 'By Jove!' and yet more emphatic invocations of our times; and that hippocras, and mead, and pigment did duty for sherry or bitter beer. But even trenchant impressions like these stand out in a dim haze of ignorance and uncertainty, and we are about as conversant with the manners of our civic forefathers as with those of republican Rome or ancient Babylon.

Indeed, it is seldom that we can have a chance of finding ourselves face to face with the everyday life of the commons of the middle ages. Clerks were scarce, and their records of common things scarcer still. Chroniclers considered the masses as beneath the dignity of history, except during one of those periodical convulsions that imperilled the upper classes; and by this time, the voice of tradition sounds faint and uncertain. Fortunately, the corporation of London, as might have been expected of a body that has made their city the metropolis of the commercial world, have been in the habit of keeping their books regularly and carefully. They seem to have thought nothing too insignificant to find a place there; and wonderful to say, their records have been preserved till now, spared even by the fire in which old London and its associations were well nigh swept utterly away. Miraculously saved as they have been, some of them threatened to expire of sheer old age, when the corporation wisely resolved to rejuvenate the old Latin and Norman-French, and to introduce them to the present generation in modern costume. The result is, a series of vivid pictures of city life, ranging from 1276 to 1419, painted by unconscious artists of the time, with a Dutch-like fidelity of detail. Fraudulent shopkeepers and obscure members of the dangerous classes little deemed that their sentence to an hour of the pillory might secure them a questionable immortality to all time.

So early as the thirteenth century, London was one of the richest towns in Europe. Foreigners were continually flocking over to the city of promise, just as the Irish and Germans of our own century go to New York; but the immigrants to London brought skill or capital as their stock-in-trade; they were substantial and industrious men, for the most part French or Flemings—artisans from the thriving Arras, Amiens, Ghent, Ypres, and Bruges, or Germans from the Hanseatic cities. Members of the great mercantile houses of Italy, already men of fortune, came to invest it at good interest or on sound security; they angled at once for whales and sprats; they combined the legitimate banking of which their own Lombard Street is still the head-quarters, with speculative financing business and that of our advertising West End money-lenders, who offer advances to gentlemen in public offices or in the army on their personal security. The well-known Florentine family of the Bardi give their name to a Society, a sort of medieval financial limited liability company. Then we have the Society of Lucca; and we find a clergyman stealing the silver-plate of Sir Baroncin, one of the members; and a gentleman who lent Edward II., when Prince of Wales, a good deal of money on his reversion to the throne. Bucklersbury takes its name from the Buckerels, naturalised Italians who rose to fill the highest posts in the city. If only they were respectable and well to do, London made slight distinction between her native-born children and her adopted ones. Penned within her walls, her thriving population soon became hard put to it for elbow-room. In those days, when a man with anything to lose settled in the suburbs, he did it at his peril. The corporation were unremitting in their precautions for the security of their wealth. The city gates were carefully closed when the first chime of the curfew rang out from St Martin-le-Grand, and at the last stroke the smaller wickets were shut, and till daybreak the city was isolated. Each ward sent its quota of warders; and some twenty men, 'strong and well armed,' mounted guard at each of the gates. During the day, sergeants 'fluent of speech' were stationed there, with strict instructions to cross-examine all doubtful characters. At night, too, all the boats on the river were made fast to the Middlesex shore. Meanwhile, there were strict police regulations for the safety of the life and property in the slumbering city. While a couple of boatfuls of river-police were afloat on the Thames, strong parties of watchmen were patrolling the town. All the taverns and hostelries closed at the curfew, under penalty, we presume, of forfeiting their licence. After that hour, any belated citizen was picked up incontinent, and summarily disposed of in 'the Tun.' The Tun was a cage of circular form, and the prototype of the Round House, the frequent night-quarters of bloods and Mohocks of a later day, and immortalised to all time by Hogarth. As with us, police charges are most frequent after Christmas-eve and other high festivals of the people, so the eve of the nativity of St John the Baptist, and those of St Peter and St Paul, seem to have been the bugbears of the quieter citizens of the period. To meet these occasions, the authorities continually took exceptional measures—each alderman was warned by circular to call on 'the good men of his ward' to act as a sort of specials. As distinctive badges, they wore party-coloured coats over their armour, and carried lances painted in different colours. It would seem that the good men cared as little as Dogberry to make or meddle with improper characters, for as they were furnished with flaming cressets fixed on long poles, they must have been visible at any distance to enemies of the peace.

The police of the day had much the same

Digitized by Google

responsibilities on their shoulders as their successors. Then, as now, they were ever launching proclamations against those who obstructed the pavement by disposing of their wares or following their callings there. The fullers were prominent offenders, and ordinance after ordinance is levelled at the tailors and pelterers, who, 'to the prejudice of the great persons and good folk,' should be 'daring enough' to scour furs and cloths in the open air, except during night or at early morning. At the same time, if oppressed by a crush of orders from 'great lords,' they might retire in the daytime to by-lanes or blind-alleys. The awning nuisance, so prejudicial in the nineteenth century to the silk hats of those who exceed the common stature of mankind, had its counterpart in those days in the protruding wooden pent-houses, which are ordered to be removed, or raised to a certain height, as men-at-arms on tall war-chargers were always knocking their helmets against them. Some of the more remote streets must have been both indifferently kept and highly odoriferous, judging by an uncompromising order that all pig-sties whatever are to be cleared away. Independent pigs foraging on their own account, seem to have been the nuisance of that day, as ownerless curs are with us. The Sir Richard Maynes of the time gave their myrmidons instructions to deal with them summarily, always excepting the swine of the blessed St Anthony, who, in virtue of their sacred character, had the run of the town. The corporation seem to have roused themselves periodically to energetic action in the matter of the purifying their city. Probably, when things got quite intolerable, they began to cure themselves. That every citizen should be his own scavenger, was their principle, and each man was bound to keep the space clean before his door, as with us after a storm, we are compelled to remove the fallen snow. They were far from consistent in their sanitary regulations. Now the citizens are commanded to shoot all their rubbish into the river; now they are forbidden to pollute the Thames in any way whatever, under the heaviest penalties. Already it had become occasionally offensive in summer to our not over-sensitive ancestors. But the Fleet ditch was the standing nuisance, and the unlucky captives in 'the mansion of our prison of Flete' suffered from 'grievous maladies which put them in no small peril, by reason of the abominable stench.' Pure water was scarce. The course of Wal-broke, coming from the open moor of Finsbury, received constant attention, and great precautions were taken against the waste of the water in the conduit in Chepe. It seems the brewers had taken to carrying pails of it away to their brew-houses. All they took would scarcely have gone far with Barclay or Truman, but we learn that at that time the value of a brewer's stock-in-trade might be counted by shillings.

The community seem generally to have lived very comfortably. We hear very little of poverty, nothing of poor-houses, no deaths by starvation. The great city markets were very much what they are now: the fishmongers had appropriated Billingsgate; the game and poultry sellers, Leadenhall; the butchers and corn-dealers, Newgate; but the people had to live half the year on salted meat and stock-fish, and vegetables we never hear of. The foreign birds that we have acclimated were scarce and rare; pheasants fetched, comparatively speaking, enormously high prices; swans, bitterns, and herons were all expensive; you could get a dozen of capons for what you would have paid for a single pheasant. Butcher-meat was to be had for a trifle. Sturgeon seems to have been a popular fish, and very plentiful; and the salmon and trout, as they swarmed in the river, would have gladdened the heart of Mr Buckland. The fishermen of Greenwich, Woolwich, and Barking were being continually hauled over the coals for catching them with unlawful nets; one of these, that much resembled the trawl, seems to have been looked on with as much prejudice then as now.

The inspectors of weights and measures had no sinecure of it. The bakers were being continually convicted of defrauding their customers, sometimes of trying to deceive the authorities to boot. One man, with unfortunate presence of mind, thrust a piece of iron into a loaf that was about to be tested, and being unluckily found out, was made a signal example of. Very frequently, the sentence was a lenient one, and confined to a confiscation of the bread. Meat unfit for human food was constantly being exposed for sale; the invariable punishment for slow-poisoning of this sort was exposure in the pillory, among the asphyxiating fumes of the putrid carcasses as they were burned beneath it. One rather intricate case is reported, where a pieman was charged with vending a pie made of a couple of putrid capons. The defence was, that the plaintiffs had eaten one of them before objecting to the flavour; but a jury of cooks, to whom the questionable dish was submitted, found unanimously against the prisoner. He was marched off to the pillory incontinent, the remains of the loathsome paste slung to his neck. The *lex talionis* was applied in the case of a vintner selling sour wine, and they forced him to drink it. We find no reports of those magnificent banquets which in later times have gained a world-wide renown for the hospitality of the city. Instead of entertaining the court and the aristocracy in the halls of the guilds, it seems then to have been the practice to buy the materials for the feast in the east, and send them to be eaten in the west—perhaps a pleasanter arrangement for one of the parties, if not both. But that the mayor and aldermen were even then of a jovial turn, we gather not only from presumptive, but from direct evidence. When their names have been taken in vain, the fine imposed is not unfrequently remitted for a tun of wine; and an alderman who had been remiss in some of his civic duties, is fined immediately in a dinner for the mayor and his brethren; and he seems to have played the host with no *arrière-pensée*.

The worthy magistrates of the day had naturally a good deal of criminal business on their hands, but on the whole, the calendar seems to have been relatively lighter then than now. There are a good many records of coroners' inquests, but with few exceptions, the verdicts are accidental death. One gentleman, to be sure, a vintner's servant, makes away with his master after a few days' service, and calmly takes his place behind the bar of the murdered man. But the circumstances appearing suspicious, the neighbours have them inquired into, and the discovery of the body is followed by confession and punishment. Theft and burglary are not very frequent, but we hear of a good many forged deeds; and thieves, forgers, and burglars are sent alike to the gallows. Considering the inducements held out to crime in a

Digitized by Google

city where sanctuaries were far more common than police-offices are now, it seems wonderful that property was not more tampered with than it appears to have been. Fancy the facilities it would offer to a rough of our times, if, after snatching a chain, he had only to make a rush with his booty for some church just round the corner.

There were professional bands of confederates, who made it their business to look out for young men from the country, and take them off into public-houses, where they prevailed on them to risk their money at games of chance and skill. We do not indeed hear of skittles, but one party, charged with cheating at 'quek' or chequer board, were seized with their table, when it was found that all the black squares were hollowed away, and that the dice which they had used were loaded. They had plucked their pigeon to his very cloak, but were compelled to disgorge. We have a pleasant story of Hugh de la Pole, who went a-begging with a pitiful and most circumstantial tale of his having come over with fifteen wounded comrades from the storming of Ypres; that the Bishop of Norwich, who had carried the place, had found there three barrels of gold, over which he had come to a quarrel with the other English knights. In proof of all of which, Mr de la Pole exhibited his wounded limbs, swathed in bandages; but some hard-hearted sceptics insisted on removing these, when they found everything below sound and whole; whereupon the ingenious De la Pole was relegated to the pillory. John Warde and Richard Leynham were the prototypes of those dumb gentlemen who sketch mackerel on the pavement, and write 'I am starving' below. They were brought before the mayor, charged with carrying in their hands an ell measure, an iron hook and pincers, and a piece of leather, in shape like part of a tongue, edged with silver, and with writing round it to this effect: 'This is the tongue of John Warde.' On examination, it proved that if it were so, at least John Warde had a duplicate within his lips, and he was remanded to Newgate indefinitely. Our impulsive ancestors seem to have been rather given to contempt of court, an offence on which the important city magistrates were uniformly severe. Robert de Suttone, for example, was convicted and sentenced for insulting the sheriff-clerk by saying 'Iprhurt, Iprhurt'—early English for 'prut'—and raising his thumb at him, 'to his damnifying, and in manifest contempt of our Lord the king.'

The memorials give us but little clue to the state of the public health; but in spite of all the sanitary precautions we have alluded to, we find evidences of room for improvement in it. There are no references to plague, black-death, or any of the sweeping epidemics of the middle ages. Leprosy was the great bugbear of the times. As in the earliest ages, the appearance of the plague-blotch meant for the leper a lifelong isolation from his fellows. Whatever his standing, he was taken from his family, and thrust out of the city. Men on duty at the gates had standing orders to guard against the introduction of the disease, by examining any unhealthy-looking individual who might present himself for admission. It would appear from some proclamations on the subject, that the wretched outcasts had the same mania for wantonly communicating the disease, as was observed with many of the plague-stricken in the Great Plague. Charity had founded lazar-houses at Hackney and Southwark, to which, as far as possible, lepers were confined.

There seems to have been no parks or gardens, nothing done for the recreation of the working-classes. Space was valuable; and when they wanted fresh air, trees, and flowers, they had to look for them outside the walls; nor had they to go far a-field, when Finsbury Circus was a barren moor, and the village of Charing stood among its copses and meadows. We have an incidental notice of the nucleus of a zoological garden, or at least of a menagerie, when Edward III. makes proclamation about a certain beast of his 'from the land of Egypt, an owre.' It sets forth that the people, envying the keepers of the beast, had threatened to do them grievous bodily harm, and atrociously to kill the said beast itself, and it accordingly warns all and sundry that the king has taken the one and the other under his special protection. We know that the authorities of those days, lay and spiritual, encouraged May-poles and similar gaieties of a Sunday; but we find them setting their faces against desecrating the Sabbath by week-day work. There is a letter from the Archbishop of Canterbury to the Council, where he draws their attention to the practice of the barbers shaving their customers on that day, and he fulminates horrible anathemas at those who should continue the practice; but he goes on to shew considerable knowledge of mankind, remarking that he is aware men are become so malicious as to be more nearly touched by a comparatively small pecuniary fine than by the most terrible of threatened spiritual penalties; he therefore conjures his dear children of the Council to see to it that they enact such fines as may at once insure a discontinuance of the practice.

On the whole, these memorials leave us with the impression that, in the case of London, there is not so much to be said against the 'good old times' as uncompromising innovators would persuade us. If the liberty of the subject was occasionally infringed, he seems to have led a not unpleasant life of it under restrictions to which he was accustomed. Certainly, we question whether, allowing for difference in population, there was not more happiness and less suffering in the old city than in the modern one.

EVENING.

Low in the pale cold sky the ashen clouds
Huddle for warmth together; as the night
Grows gradual o'er the landscape, and enshrouds
Dim valley depth and craggy mountain height.
Dogs bay from far farm-folds and farm-folds nigh;
The heifer, waiting by the pasture-gate,
With head upturned, lows at the darkening sky,
And then looks homeward. It is wearing late:
All home-life sounds now die across the leas;
And save the clamorous noise of roosting rooks,
The low, soft purl of grove-hid, pebbly brooks,
And softer sigh of wind in withered trees,
Is nothing heard, and but for which would be
Inviolate stillness and tranquillity.

CHAMBERS'S JOURNAL

OF

POPULAR

LITERATURE, SCIENCE, AND ART

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 263. SATURDAY, JANUARY 9, 1869. PRICE 1½d.

A STAR'S SURROUNDINGS.

A SLATTERNLY, unwholesome-looking woman of fifty, or a little more, but whose real age it is not easy to guess; her face haggard, deeply furrowed, and of a dull yellow colour; her eyes wild, staring, and set in broad purple rings; her head and bony hands always trembling: a woman with no healthy briskness, who seems to have lost heart long ago; who drags herself hither and thither under protest, with a voice shrill, querulous, and broken, a faint, unmeaning smile for the conciliation of her lodgers, tears more than enough when any one finds fault; add further, a dress fashionably, but not engagingly short, of the commonest material, dirty and uncared for; coarse, iron-gray hair, not often combed; boots without heels, and bursting at the sides—and you have your servant's landlady, Mrs Simmonds.

She complains of a dreadful gnawing pain between her shoulders; she never has any appetite—the mere sight of food, as she says, gives her 'quite a turn.' She can't tell what is the matter with her; she thinks that she must have hurt her backbone when she was young. Sometimes, she thumps it, to stop that miserable pain just for a minute. She won't take the physic that the doctor orders, because it is 'so nasty.' She is an ignorant woman; she can hardly sign her name; I doubt whether she can read, in the strict sense of the word. Her notions are all of the crudest. She has no particular religion! In times past, she became a Catholic, but didn't like the confessional. Talked once with a minister, a Protestant, but whether of the Church of England or not, she can't say, but couldn't understand him; never goes to any place of worship—doesn't see the good of it. She has impressions which she can't explain, and can't account for. She is bemuddled, in fact, but still not an immoral woman, or a particularly dishonest one. She can't recollect that she ever went to school. When very young, she danced, and did the horsemanship and slack-rope business, but how old she was at the time she can't say. She doesn't recollect much before this—it all seems like a fog. Her father and mother died within twelve hours of each other—both of the cholera. She rather thinks she must have come of a good stock; fancies her parents must have made a runaway match. Her father was a soldier, an officer, she thinks, and his wife followed the regiment.

But Mrs Simmonds shall tell her story in her own way. 'When I was about fourteen,' she says, 'I had an engagement at Windsor. An elderly gentleman, who used to come regularly to the theatre, offered me marriage; but I was scornful, and laughed at him. I should be glad to know where he is now; if he is alive, he might help me. I wish he could ease me of this terrible pain.' (Thump, thump.) 'When a bit older, I danced in the ballet at the Opera-house. It was hard work, but my soul was in it, and I got on. Soon after this, I first met my husband; he courted me more than a year: I first saw him just outside the theatre; he used to go with me to rehearsals, and wait at the door till I came out, and now and then make me little presents. I was a fool ever to have married him; but I was only a girl, and he was a handsome young fellow, and so I got taken in. He was a bad, drunken wretch; a lazy, good-for-nothing fellow, who might, if he had chosen, have earned as much as two guineas a week as a mathematical-instrument maker; but he only cared for boosing and low company. He used to beat me sometimes. At last, he ran away, and left me without a sixpence, and with three young children to provide for. I heard nothing more of him till he was in Australia, and sent a letter to say that I had driven him from home by my unbearable temper. The wretch! Since then, I have never had another line from him.' (Tears, cut short by that awful pain, 'like knives being dug into one,' and more thumps.) 'I brought up my eldest, Tom, to my own profession. I apprenticed him to Mr Norton, who had the Queen's Dancing-rooms, Oxford Street, and he became one of his "troupe." After this, he played in pantomimes at sixpence a night; came on as a goblin or fairy attendant; got a place as call-boy at Sadler's Wells, and might have done well too, for the leading tragedian took

Digitized by Google

quite a fancy to him; but he was a ninny, and quarrelled with the stage-manager, and had to leave. After this, he had to go into the country. He was a drone, and said he was overworked and starved; but if you take to the stage, you mustn't mind putting your shoulder to the wheel, and you don't get much money to begin with—country managers are so sharp; but Tom might have done better if he had pleased. He came back nearly a skeleton, poor fellow. At Glasgow—he was engaged at some theatre there—he lived for three weeks on nothing but oatmeal porridge, and short allowance of that. From Scotland he went to Cardiff, but never got paid. I managed to send him half-a-crown, and he said it just saved him from starving. At one time, he set up a travelling entertainment; but it failed, as everything did that he took in hand, because he had no energy. After that, he got a place as "super" at Drury Lane, but the theatre closed at the end of a month, and then I had to help him as well as I could; but I soon saw that as long as he had something to eat, and a coat to his back, he was a regular lazybones, and didn't care to try and better himself.

'As for Dick, I laid out money to give him a good start in the navy, but I was cheated by my lawyer, and my darling had to begin as a cabin-boy. I didn't know it at the time, or it would have broken my heart, but he tumbled from the mast-head in a gale, and a great piece had to be taken out of his skull, and one leg has been shorter than the other ever since.' (Tears.) 'But even as a baby he was always tumbling. When only a year and a half old, he fell from the first-floor window into the garden, and was none the worse for it. He fell from the second floor the next time, and had to be taken to the hospital. I heard of the accident when I came back from giving my dancing-lessons in the evening. I had a deal of work then. Besides my academy, which assembled twice a week on the ground floor, the parlour and bedroom being thrown into one, I taught pupils at their own homes. Round about Lambeth there are good families—carriage-folk, and I went to a school on this side of the water, and another across the park. What dreadful work it used to be coming back on stormy nights, when there was rain or snow, and having to stand in damp clothes, teaching, when one's boots were soaked through, and without refreshment, or any one caring to offer any! Perhaps it was that which gave me this horrible pain.' (Thump.) 'Just like so many knives. I believe, after all, that the bone is broken.

'Dolly was a beautiful child, and as clever as she was pretty. I put her on the table and began to teach her to dance when she was three years old. After that, I took her to the theatre, and she played child-parts, appearing in the pantomimes in the middle of a flower, or in the heart of an apple that opened at the touch of Harlequin's wand. She had lovely fair hair, and great, beautiful, wondering eyes. She was never a bit afraid. All the people in the theatre loved her. The manager, who was a regular old growler, called her his pet. By-and-by, she took to dancing, and once, when she had a *pas de seul*, she did it so cleverly that it was called for again, the very manager himself, who had gone to the "front" to see how it went, joining in the applause. When she was older, she was engaged as *première danseuse* at the same theatre, and it was then that she first came across that fellow—fine stories he told—who married her. He sat in the stalls night after night, and left flowers and jewellery at the stage-entrance. His mother was well off, but he had little besides what she allowed him, and his expectations. But Dolly, poor silly girl, didn't find this out till it was too late. He was an ensign in the army, and "I am that proud," he used to say to me, "that if my own mother spoke to me as you do, I'd never wish to see her again." Dolly was so taken with him, stupid little thing, that she got quite to forget her poor mother. She was another girl. When the marriage took place, it was like a dream. I could hardly believe it was my Dolly who was dressed in such finery and so courted. Then there were the bridemaids, and three broughams, and the coachmen with favours in their hats and on their coats, and the wedding-breakfast spread in this very house. It troubled me then, and it has troubled me since, and it does so now. When Dolly got up to say good-bye, she was as cold as a queen. I suppose she was ashamed of the old mother who had toiled for her. She just kissed me, as if she was glad to have it over, and then turned to her husband, and they were gone. Oh, she was a cold girl!

'He took a house for her in Colchester Street, Pimlico, and furnished it splendidly; but he turned Dolly's heart away from her home. He was a Catholic, and she became one too; and after that, she was always at the church, or with her prayers, or with the priest; so I scarcely ever saw her, and I left off trying to at last, for I am as 'igh and 'aughty as the best of them, and a parent has no call to stoop to her daughter. At last she went to such a pitch, giving money to churches and schools and what not—her old mother drudging, out in all weathers, with hardly enough to eat the while—that her husband wouldn't have any more of it. They had a quarrel, for she was a spirited girl, but he gave orders that no priest should be let into his house in future. In less than a year, their grand place had to be sold up. The great fortune that Dolly's husband had boasted about came to an end. It was only four thousand pounds, but girls think money in a lump more than it is. If I had known how things were, she shouldn't have married him. His mother, who despised the match—a proud, hard woman—continued his allowance, but wouldn't do anything more. Man and wife can't live on a hundred a year as gentry; and Dolly, who was a clever girl, and had got to despise her fine officer, began to look about her. She had a beautiful voice, though I had never guessed it; but I have heard her sing since, and know it to be the truth. She began to take pains with her music, and the gentleman who taught her—she had managed to save up a little money on her own account—said that if she went on with it she would be sure to be a success by-and-by. I had a prejudice against him at the time, but it turns out that he is old enough to be her father, and I am sure I am thankful if he has done any good to Dolly. A separation took place before long; my poor pet and her husband couldn't agree. Perhaps it was best for both of them. But Dolly's heart was quite turned from her mother, and I hadn't even a letter from her for more than two years. She went to Italy to study; she came out there, and made a great hit. At Florence, the gentlemen took the horses out of her carriage, and dragged it home themselves. They sang in chorus under her windows; and somewhere else she had a

Digitized by Google

beautiful gold crown given her, besides a pearl necklace and bracelets. When she came back to England, she headed an opera company, and went for a tour through the provinces. Poor stupid Tom, whom she promised to make a gentleman, was her secretary, and a deal of good he must have been to her; however, he spoke too plainly to please her, and she threw him over, and then he had no one to go to but his old mother, whom she had taught him to scorn.

'That was the way with Dolly; she made my boys discontented, prevented their working for an honest living, and did nothing for them after all.

'When she came back to town, I thought I would go and see her. However she had treated me, she was still my child; and as winter was coming on, I should have been glad of ever so little help. I had a troublesome cough, that I must have got tramping about in the wet to my lessons, and I hadn't succeeded so well as I usually did. Dolly was living at Notting Hill then. I called there one afternoon, and they said she wasn't at home; but I knew better, for I had heard her voice when the door opened. As I said, I am a bit 'aughty, and I wouldn't be put off in that way; so I gave them to understand that I knew better. "And I won't move from here," I said, "till I see her—the bad, ungrateful child." With that the servant takes my message, and comes back to say that if I don't move, Mr Sarti—that 's Dolly's music-master—will send for a policeman. "Who 's he?" I cried, "to talk about policemen? Why doesn't he come down himself, and say what he has got to say?" At this, Miss Dolly appeared, and wouldn't even shake hands with me, but told me I ought to be ashamed of myself, coming there all in rags, no better than an old charwoman, and bringing disgrace on her, and making her ridiculous before her servants. "I have worked for you, Dolly—hard," was all I could say; but she only answered: "If you want money, write for it; don't come here again, or you 'll certainly be given in charge." So on that I drew myself up, and said: "Don't offer me none of your paltry money, for I won't take it; and as for disgrace, it 's not from me that anything of that sort will come: you 'd best look at home." And with that, off I came.

'And all the while I had that Tom with me, doing nothing but sitting over the fire, and eating and drinking, and saying he didn't like this, and didn't like the other, and that there was no comfort in his home, and that I ought to manage better, till I said: "You lout, why don't you get up and work for your living, as your poor mother does? If you can't do anything else, why not help in the academy, or take some of my pupils?" "Nonsense!" he answers. "If it hadn't been for you, I should have been a made man by this time. It 's all through your goings on that I broke with Dolly. I ought to have a place of my own. If I had a house in Belgrave Road or Bayswater, I might do something. There 's no opening here with those infernal butchers and bakers, and such like." "You ungrateful fellow!" I cried. But there, it was all along with that girl of mine; she unsettled them, and now they 've no heart or wish to work.

'She did her best to spoil Dick, and he isn't the lad he used to be. He was always so affectionate; and now he is a great noisy fellow, who comes stamping into the room, and bursts into a horse-laugh, and says I ought to give him a proper dinner every day, and not odds and ends; and that the tea isn't strong enough, and that he wishes he could go into lodgings and leave me, and see life a bit, and not always be tied to his mammy's apron-strings. But it is his poor head—a great piece taken right out, and his leg makes him bitter, and at times he doesn't quite know what he is saying. Dolly promised to set him up, and I found she had put him to a wine-merchant's, where all day long he was in a cellar corking bottles. The shame! I soon had him away from there. In a little while, that girl of mine got him what she called a capital situation on a railway. He is there now—a clerk, and gets ten pounds a year, with the hope of a five-pound rise. He is at his office from nine till seven, except for six weeks in the summer, when they are making up the books, and then his hours are from nine to nine. Sometimes they give him work to bring home. When he first began, he spent nearly all his money over his dinner. But now I give him a hunch of bread and a bit of meat, when I have any; and in the evening he has a good tea, and as much bread and butter as he cares for. There are plenty others in the office besides himself. The highest, I am told, is a nice gentleman, and might be a friend to Dick, if he would let him. He has two hundred a year, and lives a little way out of town. He asked one of the younger clerks to take tea with him one evening, and Dick says he was told he was as affable and spoke to him as if he was no more than his equal.

'But Dolly is the only one who has really done well, and she is the worst of the lot.'

POCKET-FAMILIES.

NEARLY a century ago, a young gentleman called on Dr Johnson, and told him that, having dropped suddenly into an ample fortune, he was willing to qualify himself for genteel society by adding some literature to his other endowments, and wished to be put in an easy way of obtaining it. Dr Johnson recommended the university of Oxford; but finding that he was utterly ignorant of Latin, he withdrew that recommendation, and advised him to study natural history. A conversation occurred about animals, and their divisions into oviparous and viviparous. 'And the cat here, sir,' said the youth who wished for instruction, 'pray, to which class does she belong?' This was almost more than the doctor's patience could bear; and he replied: 'You would do well, sir, to look for some person to be always about with you, who is capable of explaining such matters, and not to come to us to know whether the cat lays eggs or not.' We quote the anecdote with the view of contrasting the present state of our knowledge regarding certain points connected with the reproduction of animals, with that which existed in the year 1776. The kangaroo, which was first seen by Captain (then Lieutenant) Cook, on the 24th of June 1770, was unknown except to zoologists; and there is no evidence that Johnson ever heard of it, although he survived Captain Cook by about six years.* This animal he might have believed in; but if he had heard of some of the

* The word *kangaroo* does not appear in any of the editions of his *Dictionary* that appeared during Johnson's lifetime; and (strangely enough) in Todd's *Johnson's Dictionary*, second edition, 1827, although the word *kangaroo* is given, the most important characteristic organ, the marsupial pouch, is not referred to.

Digitized by Google

facts we are going to relate in this article—of certain fishes, for instance, which, in place of eggs, produce litters of lively little fishes, quite fitted for all the active responsibilities of life; and of other fishes which hatch their eggs and nurse their young in their mouths—we have little doubt that he would have put them down as 'travellers' tales,' and unworthy of serious consideration.

Most of our readers, on seeing the title of this article, will say: 'Oh, it 's about kangaroos;' and a few, whose zoological knowledge is more extensive, will include the opossums with the kangaroos. Our intention, however, is to disregard those better-known examples of animals that carry their young in their pockets, and confine our remarks to the 'smaller deer' who favour this practice.

In the *Batrachians*, under which title we include frogs and toads, we have a few examples of the mothers carrying their young during the period of hatching, and for some little time afterwards, in pouches situated on the back. In the Pouched Frog (*Nototrema marsupiatum*), which is found in Mexico, the female is furnished with a pouch on her back, in which the ejected eggs, when they have been fertilised, are placed by the male, and where they undergo their further development. The pouch, when filled with eggs, becomes so dilated that it extends over the whole back. Here, as in the marsupial mammals, we have a single pouch. Similar structural arrangements occur in a less well known frog, discovered in 1854, by Lichtenstein, in Venezuela, and named *Notodelphys ovifera*. In the well-known Surinam Toad (*Pipa Americana*), a series of little pouches, one for each egg, is constructed at the required time. The eggs, when laid, are fertilised, and placed by the fore-paws of the male on the back of the female, where they adhere by a glutinous secretion. The female then takes to the water, the skin swells, and the eggs become gradually embedded in cells, which are closed by a membranous structure. In these little enclosed cavities, the eggs are hatched, and the tadpole stage is passed: it is not until the young have attained their limbs, and are fit for moving about on the ground, that they break their way through their cell-covers, and struggle, head foremost, into a state of free existence. At this period, the mother leaves the water, and returns to dry land. Excellent specimens of the pouched frog and the Surinam toad may be seen in London, at the British Museum and the Museum of the Royal College of Surgeons.

Here, too, we must mention the obstetric toad or nurse-frog (*Alytes obstetricans*), common in France, Switzerland, and the Rhine district, which derives its specific name from the male assisting in the exclusion of the eggs, and causing them, after they have become fertilised, to adhere to his own hind-legs by small pedicles. He then seeks the land, where he finds a concealed hole, in which he remains till the development of his young charges is sufficiently advanced, when he betakes himself to the water with his young brood. About sixty eggs, fastened on by a glutinous secretion, are thus carried about by the careful father, the mother throwing off all responsibilities.

It has been long known to naturalists, although the fact has scarcely made its way into the general circle of popular knowledge, that certain fishes present marsupial* peculiarities. Aristotle (d. 322 B.C.), the father of Natural History, observed and described a fish which he called Béloné, in the female of which was a cavity in the hinder and lower part of the belly. This cavity contained its young, and at a certain period of the year it tore away the outer wall, to allow its progeny to escape. Aristotle's errors will become apparent when we have entered a little farther into the subject. There are certain genera of fishes popularly known from their peculiar form as the Pipe-fishes and the Sea-horses, in which the males take upon themselves the office of carrying about their young in a special bag, or series of cells, as the case may be. Several species of the pipe-fishes inhabit our own shores, and have been taken on the Cornish coasts, Dublin Bay, &c.; and the sea-horses, which abound in the Mediterranean (whence Aristotle may readily have obtained them) and elsewhere, are occasionally drifted to our own shores.

The peculiarities of the pipe-fishes and sea-horses in relation to the carrying of their young gave rise to various wild speculations. Pallas, one of the most distinguished naturalists of the last half of the eighteenth century, was of opinion that each individual was possessed of a community of sexes; while Schneider, a very eminent ichthyologist, who lived a little later (d. 1822), arrived at the conclusion that all the pipe-fishes which had been examined were females, and that no males had hitherto been discovered. Recent observations, especially those of Mr Andrews of Dublin, Mr Couch, our greatest living English ichthyologist, and the Rev. Samuel Lockwood, an American naturalist, have led us to the knowledge of the following singular facts. Mr Andrews tells us that, in shoal water in Dublin Bay, he has frequently seen the Greater Pipe-fishes (*Syngnathus acus*), which attain a length of from one to two feet, lying in pairs, side by side, on a rock or stone, and that he has watched the eggs in an immature state being discharged by the female, and being received into the abdominal pouch of the male, which lies somewhat in front of the base or root of the tail. The pouch at this period secretes a glutinous matter, by which the eggs are made to adhere to its inner walls. Amongst the most remarkable points connected with this process, it may be mentioned that before the female is ready to get rid of her eggs, the slit which forms the entrance of the pouch is closed by adhesion; that at the period when the eggs are to be received, the male has the power of expanding the lappings of the pouch, so as to facilitate the entrance of the eggs; and that when the latter are fixed in their places, the opening is again closed by adhesion of the edges of the lappings, till the period arrives for the escape of the little fishes from what may literally be called their *paternal home*. Mr Couch supplies us with further and more minute details. He has found eggs in the male pouch as early in the year as April, and as late as September. Each egg in its earliest observed stage was a transparent vesicle, with a red spot directed towards the opening. When further grown, the body of the fish is seen curved into a circle, with the head projecting into a snout. At a still later period, it remains attached to the wall of the pouch; and even when the little fishes are fully developed, and able to live in the surrounding water, they will in cases of alarm fly for shelter to their former refuge, into which they

* From the Latin word *marsupium*, a pouch.

Digitized by Google

are readily received. When they no longer require this shelter, the edges of the pouch become again united. In the Broad-nosed Pipe-fishes (*Syngnathus Typhlë*), and in the Sea-horses (*Hippocampus*), there is as complete a pouch as that which occurs in the greater pipe-fish. Mr Lockwood, after many failures, once succeeded in observing a male sea-horse in the act of turning out his young, to the number of several hundreds, into the world. Immediately on coming into the water, the young fish began to swing their prehensile tails, the result being that two or three of them often got their little, hair-like, caudal appendages so entangled or intertwined with one another, that as the little creatures struggled in different directions, the loss of a tail seemed an imminent catastrophe. It is much to be regretted that he did not succeed in rearing any of the brood.

Mr King, of 190 Great Portland Street, London, has been more successful than any one else in breeding sea-horses. In five journeys to the south of France in search of them, he brought back no less than one hundred and eighty-two living specimens. On one of the journeys home, one of the males gave from his pouch about six hundred young, which at the time of their extrusion were about the size of the *s*'s used in printing this article. These curious little animals live readily in a salt-water aquarium, and will soon probably be widely distributed in a semi-domesticated state.

In other species of pipe-fishes, as the Ocean Pipe-fish (*Syngnathus æquoreus*) and the Snake Pipe-fish (*Syngnathus ophidion*), there is a singular tendency to the marsupial state, which seems checked at an early stage. In these fishes, there is no true pouch, but the eggs are transferred, as Mr Andrews has observed, by the combined action of both parents, from the female to the external abdominal surface of the male; that part of the body being, for the time, flattened, so as to retain and support the eggs during the period of their development. The eggs are here arranged in regular order, and something more than mere adhesion retains them in their places, the skin being raised up around each egg, and thus holding it in a cup from which it cannot be easily removed. There is a certain amount of resemblance between the procedure which takes place here and in the Surinam toad, in so far as the marsupial cells in each are temporary. It must, however, be recollected, that in the latter case it is the female which has charge of the family on her back.

The great moralist whose name we introduced at the beginning of this article would have been as much astounded at the idea that fishes may be viviparous as at the supposition that a mammal could lay eggs; yet, at the present day, we are acquainted with several genera of fishes which produce their young alive, amongst which may be mentioned the Blenny (of which several species are viviparous), the *Anableps tetrophthalmus* (a Surinam fish, which derives its specific name from a peculiar division of each eye by a ligamentous band, not occurring in any other vertebrate), the *Poecilia*, and the *Embiotoca* (so called from the Greek words signifying *producing living young*). The fact that these fishes bring forth their young in the form of little fishes, instead of that of eggs, is not in itself sufficient to bring them within the category of 'animals carrying their young in their pockets.' But on anatomically examining the structure of the *embiotoca*, we find they have regular pouches for their young, and that they only differ from the animals that have been previously described in the fact, that there is here no transference of the eggs, and that the pouches are formed in the interior of the mother's body, and in connection with the structures in which the eggs are primarily found. These fishes are so remarkable that we shall enter somewhat in detail into their history.

The discoverer of these remarkable fishes (or, at all events, of the peculiarity which we are now considering) is a Mr Jackson, who, soon after his return to Boston from San Francisco in 1853, informed Professor Agassiz that while fishing in San Salita Bay, he had caught with the hook and line a fish of the perch family, containing living young. The following is Mr Jackson's account of the way in which he was led to make his discovery. After having caught two of these fishes, he determined to change his bait, and to try a piece of the thin part of the belly of the largest of the fishes already captured, when 'what was my surprise,' he observes, 'to see coming from the opening thus made a small live fish. . . . . On increasing the opening, I was vastly astonished to find next to the back of the fish, and slightly attached to it, a long, very light violet bag, so clear and transparent that I could distinguish through it the shape, colour, and formation of a multitude of small fish (all facsimiles of each other), with which it was well filled.' He adds, that the number of young in the bag was nineteen, and that when they were liberated into a bucket of salt water, they were as lively and as much at home as if they had been for months accustomed to their new position.

Professor Agassiz did not see any of Mr Jackson's specimens, but subsequently obtained a number caught at the same spot, and sent to him preserved in spirits, by a Mr Cary. To the account of the bag given by Mr Jackson, he adds the following interesting particulars.* Its surface is covered with large ramifications of blood-vessels, and it is divided internally into a number of distinct pouches, opening by side-slits into the lower part of the sac, which seems, in an anatomical point of view, to be nothing but the widened lower end of the ovary, while the pouches within it are formed by folds of the ovary itself. 'In each of these pouches a young individual is wrapped up as in a sheet, and all are packed in the most economical manner, as far as saving of space is concerned, some having their heads turned forward, and others backward.' In the specimens examined by Professor Agassiz, the number of the young varied. Their size, as compared with their mother, was very remarkable; a specimen ten and a half inches long, and four and a half inches high, containing young ones nearly three inches long, and one inch high. Judging from their size, he at first suspected that the young could move at will in and out of the sac, like young opossums; but, on further investigation, he ascertained that this was impossible; but as these young have fully developed gills, it can hardly be doubted that the water penetrates into the marsupial sack.

Mr Lord, the naturalist to the British North American Boundary Commission, has added considerably to our knowledge of these viviparous fishes in his interesting work entitled *The Naturalist*

* The following details are taken from the professor's Memoir in *Silliman's Journal* for 1854.

Digitized by Google

in British Columbia, the covers of which are adorned with a gilt figure of the female fish with most of her young shewn *in situ*; while a few that have escaped when the abdomen was opened, are seen lying around her. Mr Lord's discovery of these fishes in Vancouver's Island was made almost simultaneously with Mr Jackson's similar discovery, a long distance off, in California. According to Mr Lord, the geographical range of this fish is from Sitka to the Bay of San Francisco, or possibly much further south. They are abundant on the coast of Vancouver's Island, where they swim close to the surface in immense shoals. When alarmed, they leap high out of the water; and the Indians, by lashing the sea with their paddles, actually frighten the fish to leap into their canoes. He stumbled, like Mr Jackson, upon the discovery of the viviparous nature of these fishes without the slightest previous suspicion of the fact. On dissecting back the walls of the abdomen of the fish in which he made the original discovery, he found a bluish-white bag with folds, in each of which was packed away a little fish, of which there were fourteen. Moreover, he quite confirms Professor Agassiz's statement as to the relatively large size of the young fish as compared with the size of the mother. Dr Gunther, in the British Museum Catalogue of Fishes, vol. iv. page 245 (quoted by Lord in page 353 of his second volume), uses the generic title of *Ditrema* for these fishes, and recognises no less than seventeen species; the illustration to which we have referred being that of the *Ditrema argenteum*. For the benefit of those of our readers who have forgotten their Greek, we may add that the term *Ditrema* indicates that the fish possesses two distinct abdominal apertures.

We shall conclude this article with a notice of the latest, and at the same time the most remarkable of the discoveries of this kind. Professor Agassiz, in his recently published *Travels in Brasil*, gives an account of certain fishes occurring in the Amazon, which carry their young, from the egg-state to that of perfect development, in their mouths. This peculiarity exists in the type of fishes called by the natives *Acarà*—a term which they apply to various oval-shaped fishes belonging to several genera. How the eggs are brought into the mouth, has not been ascertained, nor does the professor state whether it is exclusively one of the sexes that possesses this peculiarity; but that the eggs are thus transferred soon after they are laid, is obvious, because eggs in every phase of development are found associated together in that position. Occasionally, instead of eggs, a brood of young, already hatched, was found occupying the cavity of the gills as well as the space enclosed by the gill-membrane. The eggs, before hatching, are always found in the same part of the mouth—namely, in the upper part of the branchial arches, protected by a special lobe or valve, formed by certain bones known to anatomists as the *upper pharyngeals*. The cavity thus occupied by the eggs corresponds exactly to the complex gill-cover of that curious family of fishes inhabiting the East India Ocean, called, from this peculiarity, *Labyrinthici*, of which the Climbing Perch (*Anabas scandens*) is the best known example; and the professor throws out a prophetic hint that the branchial labyrinth of these fishes may possibly be a breeding-pouch as well as a mere respiratory apparatus. This suggestion, coming from such an authority, will doubtless lead some of our medical officers in the East (many of whom are skilled naturalists) to investigate the life-history of the climbing perch.

In a later part of his voyage, the professor obtained numerous specimens of a new species of these fishes, which furnished a complete embryological series; some of them having their eggs at the back part of the gills; and others, their young in the mouth, in different stages of development, up to those which were a quarter of an inch in length, and able to swim about freely when removed into a vessel of water. The most advanced were always found outside the gills, within the cavity formed by the gill-covers and the branchiostegal membrane whose office it is to close the gill-opening.

A careful anatomical and experimental investigation shewed that the marsupial pouch thus formed in the gill-region is provided with a very sensitive network of nerves, the principal stem of which arises from a special nervous mass (or ganglion) lying behind the cerebellum, in the medulla oblongata (which is the name given to that anterior part of the spinal cord which lies within the cavity of the cranium). Hence, we have a peculiar modification of nervous structure, by which an obvious connection is established between the care of the offspring and the parental organ of intelligence.

In the case of the Australian mammals, the special nature of the climate sufficiently explains why the marsupial arrangement should prevail over that sterile continent. Whether any equally plausible reason can be found to explain why two or three kinds of batrachians, and a few fishes, should deviate in so extraordinary a manner from the ordinary course of nature, we know not: these isolated cases are, as it were, problems to which, at present, we see no solutions, and which must be left to future inquirers in this field of science.

A PERFECT TREASURE.

CHAPTER III.—MRS BLUNT'S VISIT.

On the ensuing day, Mrs Eleanor Blunt drove *Proudfoot*—in whose steadiness and decorum she had, ever, the same misplaced confidence—over to Hershell Point, which was called by those in the immediate neighbourhood 'the Point,' and joked upon by my new acquaintance accordingly. She always complained with respect to us that it was impossible to come 'straight to the Point;' and called the series of inclines that led to the house from the upper cliff *Voyages en Zigzag*, after the French book of that name, which she lent me, and with the illustrations of which I was hugely delighted. My uncle and she became great friends, to my extreme satisfaction, and not a little to my surprise. I had felt an apprehension that this *littérateur* and bookworm would not have properly appreciated my kind protector, who rarely read anything but the *Gardeners' Chronicle*, and had pronounced one of Mrs Blunt's own *chefs-d'œuvre*, which I had once persuaded him to attempt, as 'fudge.' I did not then understand that 'character' is more attractive to a person of genius—and such Mrs Eleanor Blunt decidedly was—than any mere sympathies of taste.

She was charmed with Uncle Theo's modest yet perfectly independent air, his natural talk, his manly carriage; and he, on his part, received with something more than courtesy a lady who did not spare her praises of his nephew. I will never own, even to

Digitized by Google

myself, that Mrs Blunt was insincere; but although no flatterer, she was an adept in the art of pleasing. 'I had expected,' she confessed to me as I accompanied her part of the way home that evening, 'to have found in the ex-maharajah a sort of Dugald Dalgetty; instead of that, he is a Bayard: he could surely have never picked up that stately courtesy at the court of Bundelbad with that wonderful woman.' Here she became a little hysterical, and had to wipe her eyes. The fact is, I had shewn her the portrait of my eccentric aunt-in-law, not without some pardonable pride; for surely if to be illegitimately descended from royalty is a matter for self-complacency, how much more to be lawfully, although indirectly, connected with it. 'You need never fear,' she went on, perceiving in me some discomfort, 'my putting that guardian angel of yours into a book. Such a life-history as his could be only fitly written in lively French. And yet,' mused she, 'no Frenchman would understand him. If there is something of Murat and Warren Hastings about that capital relative of yours, there is more of Uncle Toby.'

'That is quite true, madam,' said I gravely.

She looked at me with a comical air, as though she would have said: 'You are young for Sterne, Master Marmaduke,' but uttered no remark. She was desirous at that time, if not of discouraging my literary proclivities, at least of not forcing them into premature activity. She had had too much experience of juvenile geniuses to take them at their self-estimated value; and she had too kindly a regard for me to assist, without some proof of my fitness for that calling, in my 'devoting myself to literature'—a phrase that has more of its primary Juggernautish signification about it than neophytes are apt to imagine. I am bound to say that while discussing my favourite branches of reading in a manner that could not but enhance them in my eyes, she parried every leading question that I put to her with respect to the profession of letters, and when she spoke of it in the abstract, always called it 'that heart-breaking business.'

Still, when I at last did put the question: 'Then why have embraced it yourself, good Mrs Blunt?' it was difficult even for her to reply to *me*, boy as I was: 'Because I felt I was fit for it; whereas you, Master Marmaduke, are not fit, being a goose.' She only gave a great sigh, and said: 'You may bring your manuscripts to-morrow, my dear—all the best of them, that is—but I shall never like your works one-half so much as I like *you*'—which was, I thought, but a left-hand sort of compliment.

The selection thus imposed upon me proved a very invidious one, although my own genius was alone concerned. If one of my precious manuscripts excelled in imagination or fancy, another had the pre-eminence in pathos. Fortunately for Mrs Blunt, *Wildred the Half-caste* was too bulky to be put in my pocket, or perhaps even in her pony-carriage, had I borrowed that equipage for the purpose. I only took a specimen chapter or two, to give her an idea of my more elevated style, half-a-dozen shorter narratives, and about ten pounds weight of poems, all in a knapsack.

The expression of my talented friend's face as I exhibited these works *en masse* upon her drawing-room carpet—for the table could not hold them—would have been a study for Gustave Doré. 'Don't you think you could winnow them just a little more?' inquired she pathetically; whereupon I did take out three or four exquisite poems, although it was like parting with my heart's blood.

'You shall read these afterwards,' said I, 'if you like the rest.'

'Thanks, my dear,' said she with gravity; but I saw from the motion of her shoulders that she was laughing; the dear little lady was so plump, that mirth very literally 'moved' her—it set her wabbling like *blanc-mange*.

In the course of that week, Mrs Eleanor Blunt passed judgment upon my literary efforts. It was her custom to write to me almost every day. I never knew any one at once so skilful with her pen and so willing to use it. Famous authors are generally chary of their epistolary favours; they do not like to write for nothing when they can earn a shilling a line; or perhaps it would be more charitable to say that they have enough of professional writing to tire them, and are obliged to cut short their communications to their friends. But Mrs Blunt, though one of the most prolific of English writers, wrote more private letters than any of those poor idle women who suffer from *cacoëthes scribendi*, and they were long letters too; although, being written in a microscopic hand ('Which I practised for cheapness' sake, my dear, in times when the cost of postage was very heavy'), they occupied but little space.

In yonder desk lie at least three hundred of them, marvels of wit and sense; and one lock of snow-white hair from her wrinkled forehead, which I value more than all. Yes; here it is:

> And my own breath
> Stirs its thin outer threads, as though beside
> The living head I stood in honoured pride,
> Talking of lovely things that conquer death.
> She pressed it oftentimes, and underneath
> Ran her fine fingers.

But to my story.

Her verdict was passed by letter.

'I HAVE read your manuscripts, dear Marmaduke,' wrote she, 'and some of them with an interest quite independent of the writer. They are very unequal, though the worst of them have some redeeming points. There is nothing so good as to enable me to say: "This boy will make his mark." The very best of the poems is but an echo. Still, they are better than Lord Byron's were at the same age; and, in my humble opinion, we have had no such poet in this country in my time as Byron. I knock you down with one hand, you see, and pick you up with the other, just as the National schoolmaster here boxes his boys' ears (for I have seen him do it). The fact is, you have placed a responsibility on me which I must shift in part from my own shoulders to those of your good uncle; it is too grave for me to bear alone. If the promise exhibited in what you have written were less than it is—that is, considerably less—I should say: "Give up this cherished idea of a literary life, and be content with an ordinary calling;" if the promise were only a little more, I should not hesitate to say: "You are born for letters, and will be a successful writer." But as it is, the matter, being in doubt, becomes a mere question of finance. I know nothing of your pecuniary prospects, my dear; indeed, you seem to know nothing about them yourself. (Do not suppose that is in your favour; it is a popular error that assigns as an attribute of genius an inaptitude for business

Digitized by Google

affairs. It is quite possible—though, of course, this is not your case—to be stupid at everything.) Well, you must go to your uncle, and find out what is likely to be your future position. If you are always to possess a moderate independence, or even a small one, then you may become a literary man, as the loose phrase goes, and not trouble yourself about another pursuit. But if you are to be a poor man, or to be left poor when that good friend of yours shall have departed (a sort of friend that is very rare, Marmaduke), take the advice of one who has been exceptionally fortunate in a very risky trade, and eschew literature as a calling altogether. You have more than once heard me call it a "heart-breaking business," and I was born tough. I never much cared for what people said of me, and still less of what they wrote. But you, my poor Marmaduke.

> Who killed John Keats?
> I, said the *Quarterly*—
> With my Review so slaughterly,
> I killed John Keats.

And John Keats, whom I knew well, had the hide of a rhinoceros compared with yours, which is but goldbeaters' skin. Yes, you'll be fool enough to read all that the reviewers say about you, and to be tortured by them. I warn you, without forbidding you, as St Paul warns young ladies upon the subject of matrimony; you will have trouble in the flesh. Yes, my dear, this in any case; and though your union with literature should be the happiest on record. But this inconvenience is nothing compared with the combination of poverty and failure. My good boy, let me entreat of you to have another string to your bow, to have another weapon to fight the battle of life with beside the pen, if you are destined to be poor. The most successful writer of any age has left it on record that "literature is a good staff, but a very bad crutch;" and he never wrote a more pregnant sentence. I paraphrase it, for fear of misinterpretation. It is a perilous thing to trust to this profession of letters for sole support, although it may supplement an income very agreeably. Perilous? Nay, the stage itself is not a more wretched calling (and I well know the wretchedness of *that*), nor one in which it is more difficult for the aspirant to undeceive himself. The author and the actor who have mistaken their professions are scarce to be convinced by starvation itself. I do not wish, however, to overstate the case: you may not starve, but you will certainly not carry the heights of Literature by assault. You will wait outside in the cold, it may be, for years; your manuscripts unaccepted, or, if accepted, ill paid—perhaps unpaid. When Shakspeare talks of the "insolence of office, and the spurns that patient merit of the unworthy takes," he must have had a prescient eye to editors. My *Hearths and Homesteads*—the best work of its day, I may say *now*, I suppose—was refused by six of these critical gentlemen, and eventually made the fortune of a publisher. Now, constant rejection, which is only galling to the man of means, is to the poor man Death. I hope, my dear lad, I have thus written enough to warn you against going into such a profession as that of letters without well counting the cost. As to other callings, your uncle is, of course, the proper counsellor, and you will be guided by him.—Always your affectionate well-wisher,

ELEANOR BLUNT.'

This courteous communication was a sad blow to me; for, conscious of my own merits, I had expected a decision of a very different sort. I say 'decision,' because it was at Uncle Theo's desire, as much as my own, that I had placed those ill-appreciated manuscripts in the hands of Mrs Blunt, and her verdict, it was agreed, was to be final. 'You can scarcely be an unprejudiced judge of your own productions, Marmy,' he had replied to me when I spoke of becoming an author; 'and as for Sangaree and myself, we are no critics. But this good lady at Sandiford is in a position to say "Yes" or "No" to the question: let her see all that you have written, all those effusions which seem so excellent to yourself, and so unintelligible, because I am so stupid, to me, and let us hear her advice, and follow it.'

My heart had yearned towards my generous, simple-hearted guardian as he thus spoke. Notwithstanding certain hints of an Indian Civil Service appointment, which had from time to time dropped from his lips, he would, it was thus made evident, permit me to follow the bent of my own inclination, if I were only pronounced by competent authority adapted for the calling of letters, and I had had no doubt of a favourable verdict. It was true that my manuscript works, both 'prose and worse,' as the wit has termed such, had seen the inside of several publishers' establishments, and of half the magazine offices in England, without the least sign of acceptance: some had been sent back to me with courteous frigidity, with meaningless 'Compliments' or 'Thanks,' and the rest I had a shrewd suspicion were feeding editorial fires. But I comforted myself with what I had read somewhere concerning the exclusiveness of literary cliques, the preference shewn to the staff of a periodical over volunteers, and also with the charitable reflection, that it was only natural that so novel and striking a writer as 'Leo' (for I was fool enough to use a *nom de plume*) should meet at first with envious obstruction.

But I had entertained no apprehension that so excellent a judge of literature as Mrs Eleanor Blunt would fail to see my peculiar merits, and her shortcoming in this respect disappointed me bitterly. It was impossible in her case to attribute it to jealousy, though I did try to reflect that successful persons are generally inclined to discourage others from attempting obstacles which they have themselves surmounted. I was driven to extract what comfort I could from the letter itself. If it was not decisively in favour of my own plans, it was by no means against them. Perhaps Uncle Theo could allow me, without inconvenience, a sufficient income to maintain me until my literary merits were acknowledged, without the necessity of my becoming an Indian judge—a position, by the by, much easier attained at that time than it is at present. Perhaps—but perhaps not. I was as ignorant of my pecuniary position as Mrs Blunt had hinted; I had always felt a delicacy in inquiring about it. I only knew that to Uncle Theo I must be indebted for my future maintenance, as I had so long been for my past. We had never spoken upon the subject at all, except on that one occasion when he had said: 'When I am gone, Marmy, this little place will be your own,' and had alluded in that mysterious manner to Tannajee. When I carried Mrs Blunt's letter into my guardian's room, I knew that some

Digitized by Google

explanation must needs be made, some understanding come to, and I felt myself grow now hot, now cold, not—to do me justice—from anxiety as to my own prospects, but from the unpleasantness of having to enter upon so delicate a subject at all. It was hard to feel myself possessed of so sensitive an organisation, and yet to be denied the more advantageous qualities of genius. I had half a mind to give up my favourite project altogether, and to throw myself at the ex-maharajah's feet with: 'Uncle, I am a born fool; and ready to be a judge in India.'

CHAPTER IV.—THE FIRST HINT OF THE SECRET.

My uncle was in his study, a chamber, however, which scarcely possessed a single book, though it had a desk and an inkstand. Its chief article of furniture was his turning-lathe, at which he would work for hours in constructing a number of ingenious articles in sandal-wood and ivory, vast quantities of which he had brought home with him from the East. Our little drawing-room was so lavishly furnished with these ornaments that it looked like a bazaar. Sangaree Tannajee passed almost as much of his time in this department as his master, under pretence of assisting him; but the obese Hindu had in reality no more experience of mechanics than I had of making chupatties. He would sit smoking my uncle's cheroots upon the carpetless floor, with his legs folded under him, and gaze with lack-lustre eyes at the flying chips and spinning wheel until he fell asleep. It will doubtless seem very indecorous that Sambo should sit smoking, with his hands before him, while his master toiled, but the fact is there were no bounds to that fat scoundrel's idleness and impertinence. He did just what he liked of the work of the house, and that was almost nothing; he treated me with studious insolence (Master Marmy was the best name he had for me), and my uncle with at least a great want of respect. In public, indeed—if I may so term the few occasions when we had company at 'the Point'—he used to affect an Eastern servility towards his master (although even this thin polish was gradually wearing off), and salaamed and sahibed in a most ludicrous manner; but when we were alone, his tone was disagreeably familiar, and was growing more so daily.

On the present occasion, when I entered the study with Mrs Blunt's open letter in my hand, Sangaree was seated on the floor as usual, putting his lazy lips to his cheroot just sufficiently often to keep it alight, and lolling his head slowly from side to side like a sick elephant. Uncle Theo, with his coat off, and his pleasant face shining with toil, was listening to him attentively, while the other spoke a few languid words in Hindustanee; and though I knew nothing of their import, it was impossible to misunderstand the self-complacent and offensive air with which they were delivered. It was not the first time nor the second that I had known him thus repay his master's good-nature and forbearance with insolence. I had hitherto, however, abstained from interference (although it must be owned that Master Marmy took up the cudgels very readily when his own dignity was similarly outraged); but now, being vexed, to begin with, thanks to Mrs Blunt's verdict, I fairly lost my temper with the rascal. 'Sambo,' said I roughly, 'get out; I wish to speak to my uncle in private. Do you hear, you fat lout? Get out!'

I daresay my manner was rather offensive, as indeed I had meant it to be; but I don't think it was that which annoyed him, so much as my touching the fattest part of his fat person with the tip of my toe. He leaped up with an agility for which I should not have given him credit, and uttered some forcible ejaculations in his native dialect. I believe he also attempted to strike me; but I am not quite sure of that. My uncle was between us in an instant. I had never seen him in a passion before. I could henceforward picture to myself (which I had been hitherto unable to do) how Uncle Theo, sword in hand, at the head of the Begum's irregular cavalry, had looked; or cutting his way through the said troopers when he flew from the embraces of my aunt-in-law. It was not with me that he was thus enraged, but with the Hindu. At first, Tannajee cowered before the storm, and looked, as I have no doubt he was, exceedingly frightened. Then, as the rain of epithets slackened, he began to pluck up a little, to grumble, to gesticulate in his turn; and then to pat his stomach. With Sambo, as with the gorilla, this curious pantomimic action was always indicative of menace; it was somehow a sign, too, that he was growing absolutely dangerous, for it always had its effect upon his master. Upon this occasion, I noticed, with no small sense of humiliation, that my uncle's manner at once became grave and conciliatory. If I had had my way, I would have treated the rascal's ill-temper in a very different fashion. I felt like a planter in the Southern States with respect to this refractory Sambo, or rather as an Englishman in India regarded Hindus during the Mutiny. It is recorded that a cruel sepoy once underwent at the hands of our soldiers the following medical treatment: they gave him all the blue packets in a Seidlitz-powder box, and then all the white ones; and I should like to have tried that cooling prescription upon Mr Sangaree Tannajee whenever he patted his stomach.

I am afraid I may be thought arbitrary and tyrannical, but the fact is it was this scoundrel who was the tyrant of the whole house. He used to swear at Martha the cook, until he made her cry—though she was a tough one too—and absolutely, on one occasion, broke her own broom over the shoulders of our poor little maid-of-all-work, Nancy. His excuse, in the latter case, was (appropriately enough) that he was under the influence of bhang—which was his general name for any sort of spirituous liquor. He got drunk every week of his life upon something or other; gin, Dublin stout, spirits of wine—nothing came amiss to his palate so long as it was strong. He ate little else than rice, but that little was sometimes of an abominable description. He cooked everything for himself with his own hands, and perhaps that made Martha inclined to be scandalous; but she once confided to me that he had curried a cat. I could believe anything of him; and should not have been surprised (since there were opportunities, after storms at Hershell Point, for his indulging in that practice) to find that he was a ghoul, and ate human flesh. Whatever he ate, it must be owned it nourished him, for he was growing obese and unwieldy, and his little eyes sank deeper every day in his fat cheeks. In his person, I am bound to say that Tannajee was scrupulously clean; when not drinking or smoking, he was

Digitized by Google

always washing, and spent hours at a time in the sea. Unfortunately, as I then thought, there were no sharks in Hershell Bay; for the time was yet far off when, to use my uncle's words, I was to find 'that Tannajee a perfect treasure.'

I never thought him more utterly worthless than at the present moment, when, as he withdrew from the study, still muttering and grumbling, my uncle turned on me, and gave me the first scolding I ever heard from his lips.

'You are hasty and foolish, young sir,' said he. 'Why do you thus anger that poor fellow?' (I thought of Tartuffe.) 'Because his skin is brown, is that a reason for your hatred?'

'I hate him, uncle, because he is so disrespectful to you.'

'Never you mind that, lad; I can take care of myself, thank you; and besides, he 's not wanting in regard for me, although his manner of shewing it may be peculiar.'

'He is a drunkard,' said I, rather sullenly, I am afraid, for his master's forbearance towards this scoundrel seemed to me nothing less than infatuation.

'Perhaps, Marmy,' rejoined Uncle Theo gravely, 'if you were an exile in a foreign country among persons of another race, and even colour, you too would take to drink: many Englishmen do so in India.'

'But he beats the servants.'

'Many Englishmen do so in India,' reiterated my uncle tranquilly: 'we must know how to make allowances for others. At all events, Sangaree Tannajee was once my faithful and attached follower in very troublous times.'

'O uncle,' cried I, 'pray, pray forgive me; I have behaved unkindly and ungratefully. Henceforward, Sam—I mean Sangaree—shall never be treated otherwise than well by me. I will ask his pardon, if you wish it, immediately.'

'No, no! don't do that, Marmy,' said my uncle rather hastily; 'he would misunderstand you: we must not seem, you see, as if we were afraid of him.' My dear guardian spoke in a hesitating and even painful manner, which I could not understand. But presently he added briskly: 'Come; I forgive you, Marmy; and do you, on your part, forget that I was angry with you. It has never happened before, my lad, has it?'

'O sir,' said I, looking up into that bronzed and comely face, 'I am an ungrateful boy. I have done nothing to deserve your regard, as this faithful fellow doubtless has, and yet I treat him'——

'Hush, hush, lad.'

Uncle Theo stooped down, for though I was a tall youth of my age, he was almost a foot taller, and kissed my forehead; his blue eyes—so tender that they softened the bushy, hard, and grim moustache and weather-beaten features wholly—were moist with tears.—'What is it brings you here, Marmy?'

A few minutes ago, and I had resolved not to shew him Mrs Blunt's communication, but now I felt that I could withhold nothing from him, any more than from the mother whose place he filled for me; so I placed the letter in his hand. He read it very slowly, spelling it out half aloud to himself, for he was not familiar with manuscript. 'She seems a wise and prudent lady, this friend of yours, Marmy,' said he gravely. 'Let us take counsel together over what she says. We agreed, I think, to abide by her decision as respects your literary talents?'

'Yes, uncle,' said I as blithely as I could, but not without a wince.

'Well,' continued he good-naturedly, 'she evidently thinks more highly of them than she trusts herself to speak. If her decision had been dead against you, there would have been nothing for it but for you and me to part: that would have vexed us both, I think. I at least, who am growing old, would have felt very lonely here, with the seas rolling between me and you, lad. Perhaps I should never have seen you again. That Indian life is not what it used to be; the pagoda-tree has been too well shaken. It would have taken you half a lifetime to make your fortune; and even if you had made it more quickly, how much might you have lost in exchange? Look at me, Marmy—an old, ill-thought-of man, without a friend, because my days for friendship-making were passed out yonder.' He pointed across the eastern sea, that stretched below us, a plain of molten gold. 'I am glad my boy is not to be sent to that school.' He stopped, and gazed upon me with a wistful sorrow. 'I wish, Heaven knows,' he went on, 'that I could say: "Follow your own way, Marmy; and whether you succeed or not—whether you gain a shilling by your pen or not, there is enough and to spare for us both." But I cannot do this. It is necessary that you should do something for yourself, not for my sake, but for your own. I have sufficient to last us both so long as I am likely to live, but I have nothing to leave behind me except'—here Uncle Theo hesitated, evidently at a loss to express himself—'except a contingency. I myself may be very rich some day, Marmy. It is almost certain that you will be so. But in the meantime we are poor; every year, every day, we are growing poorer, for the fact is we are living on our principal. Of course this seems to you the height of imprudence; but it is too late to talk of that now. I calculated upon a certain expectation, which did not turn up so soon as I anticipated. Perhaps you are saying to yourself: "Why does my uncle thus speak in riddles?" I cannot help that; I would tell you all if I could: there is no confidence, no secret, which is my own to tell, that I would not repose in you.'

'I am sure of that, Uncle Theo.'

'I hope so, lad. But, to convince you of it, see here.' He opened a little writing-desk, touched a secret spring, which set free a small drawer, and took from it an envelope, bearing this address upon it: *To my Nephew, Marmaduke Drake. To be opened immediately after his uncle's death.* 'I put this back again, Marmy, in the fullest conviction that you will never break that seal until the proper time arrives.'

Nothing could be more matter of fact and simple than my Uncle Theo's manner. Although his own career, to that large class of persons who 'believe nothing they do not read in a newspaper, or which does not come within their own trumpery experience,' might have seemed a melodrama, he himself (like him who had talked prose all his life without knowing it) was quite unconscious of the fact. Nothing imposed upon him in what he saw of life. The fame of Mrs Eleanor Blunt was no more to him than that of any tradesman whose goods were extensively advertised; the Begum of Bundelbad was in his eyes merely a coarse, passionate woman, like Martha the cook. I am sure it did not seem strange to himself that he should be an ex-maharajah. In short, he was the most

Digitized by Google

inartificial as well as straightforward of mankind. Thus, though in so singular a statement from any other man I should have suspected at least exaggeration and stage-effect, I well knew that Uncle Theo had told me the truth, and nothing but the truth (although, for reasons which were beyond his control, it was not the whole truth), concerning our affairs.

'To be still more explicit, Marmy,' continued my uncle, shutting up the desk again: 'we two can live on here as we have hitherto done for the next five years, during which, let us hope, you will be able to establish your footing in literature. If so, you shall help to keep your old uncle; and if not, well, we must sell Hershell Point, and live on the proceeds until better times!'

'You shall never sell "the Point" on my account, dear Uncle Theo,' cried I warmly. 'And oh, if I could but make you rich (not repay you what I owe you, for that is impossible) by my own exertions, how happy should I be! It would be worth all the fame in the world! Five years in which to push my way! I must be a very slow mole indeed, not to get through all difficulties in that time!'

Uncle Theo nodded and smiled, or he was very willing to share the confidence which I felt in my own powers. 'I hope so, lad, indeed; and I am sure it will be your misfortune, and not your fault, if you fail in the matter. We can but do our best, you know, whether we use pen or sabre. But, in the meantime, be civil to Tannajee, though I am afraid (and here he smiled) 'the true worth of that poor fellow will never be discovered by you until he is gone.'

FROM THE ICE-FIELDS.

The British tourist is little known in Iceland. It is not a polyglot country; he cannot speak the language, and he cannot get on without speaking it; there are no roads in those portions of the island which are especially worth visiting; and the prevailing customs with regard to food are unsatisfactory. These are all sound reasons why the Briton should draw the line of northward travel at Norway, Sweden, and Denmark, and also why we should feel grateful to the enterprising Swedish professor* who has explored the islands thoroughly, as well as to that accomplished scholar, Mr Barnard, who has made so admirable a translation of his work. The country, abounding in natural features of great interest, and in myths and traditions of immense antiquity and significance; and the people, few, but of strongly marked character, of a stern intelligence, and ardent lovers of liberty, form delightful subjects of study for the stay-at-home travellers for whose delectation the dauntless author of the present work underwent so much. Iceland, with her ice-mountains, her warm springs, her volcanoes and streams of lava, her sandy plains and rapid rivers, is 'a land of reminiscences, where well-nigh every spot has its history written by the hand of man. But besides this, it is an open book of nature, a country where the formation and transformation of the earth's crust take place on so grand a scale that the lapse of even a few years is often sufficient to make the effects of this transforming power evident to the attentive observer.' The exploration is by no means easy, nor is it quite free from danger; it is one of the very few things in the category of travel which still includes self-denial, energy, and courage. The desert tracts are monotonous, the treeless wastes are sad, the fjelds are naked, the mountain torrents are many and boisterous, and their courses are capricious. There is not a little resemblance between the life of the Icelander and that of the Arab, especially in the dependence of both upon their horses. 'The Icelander,' says the professor, 'can scarcely go a single step without his horse; and should this fail him, his life is placed in peril. It must carry him over long and barren wastes, where hardly a handful of grass is to be seen wherewith to appease its hunger, and yet the Icelandic horse has one great advantage over its Arabian congener—it never lacks water!'

On the eighteenth day of a voyage from Copenhagen, the professor saw the lofty islands in Fuglasker, the most south-westerly point of Iceland—the mainland being enveloped in fog, which abounds in the country. A grimly grand spot is this extremity of the volcanic peninsula, with its outlying island of suggestive name—Eldey, or fire-island—haunted by the phantoms of the great auk. What a strange place it must have been, when the ugly monster penguin, with its flabby, swimming flaps instead of wings, was common there! Then came the entrance into the broad Bay of Farajoror, crowned by the Snäfell Jökul, a volcano four thousand five hundred and seventy-seven feet high, whose snow-clad cleft summit rises up from the sea like a pyramid. The only habitable parts of the island are the narrow strips of land running parallel with the coast, or at the bottom of deep valleys. Solemn and forbidding, but in its grim way beautiful, must be that treeless country, with its sharp ridged mountains studding the coast—gigantic partition-walls between the numberless fjords that everywhere intersect it and its wide interior table-lands; a kingdom of fire and of snow, with perpetual tokens of the presence of the fire, fantastic, capricious—the volcanoes now forming solitary and barren crests, rising up from the plains, without any connection with a mountain-ridge or plateau; again, the eruptions taking place on the lower table-lands, without any apparent connection with the mountains themselves. A grave, peaceful, industrious, thoughtful people live in this wonderful country, in the perpetual sight of those natural phenomena which appear to us most awful and imposing, under conditions of existence which are rather quaint and grim than rigorous.

The seaport town of Reykjavik is a miniature of Copenhagen, with two thousand inhabitants, partly Danish, partly Icelandic. Trade is very remunerative, but few of the merchants are residents; their business being done by paid managers, who have also a percentage on profits. The form of the government—separate, except in a financial point of view, from that of Denmark—is simple and satisfactory, and great unanimity and sound public spirit prevail. Of course, there is a 'National' party, but it is moderate in its views as yet, and not obnoxious in its proceedings. The ecclesiastical interest is powerful in the little place.

* *A Summer in Iceland.* By C. W. Paijkull, Professor of Geology at the University of Upsala. Translated by the Rev. M. R. Barnard, B.A. London: Chapman and Hall.

Digitized by Google

There is a bishop, with a staff of twenty archdeacons, and there are one hundred and ninety-six livings, a pastoral seminary, and an elementary public school. On the whole, an idea of tame, well-to-do respectability is gained from the professor's description of the social aspect of Iceland. Uniformity in dress, buildings, and modes of life, gives a general dulness to the scene, no doubt, which is not contradicted by the wide-spreading ice-fields, and the perpetual menace of Hecla. In the vicinity of Reykjavik are seen the 'rucks' peculiar to Iceland. They are plains of stone and sand, whose surface presents the appearance—owing to the way in which the small stones and pebbles crossbar it—of land-drains in a field. The explanation of the phenomenon is that the earth, rendered soft by the melting of the snow in spring, has become dried by the heat of summer; rifts or cracks are formed in it; and when a storm occurs, the small stones that lie on the surface of the ruck are swept down into them.

Roads do not exist in the interior of Iceland—carts are unknown—all journeys are made, all merchandise is carried on horseback—and the bridle-paths, though good, are singularly embarrassing and disheartening to a stranger, especially when they are crossed by the tumultuous streams which rush down from the enormous snow mountains. There are few bridges, and the strength and rapidity of the currents generally render a ferry impossible. There are no stations for the entertainment of travellers, and the way has few distinguishing marks, consequently, a guide is indispensable. It is not easy to realise that the mere thread of pathway, totally unimportant, like a footway through a field, and actually crossing the bottom of brooks in the road, is the only highway to the far-famed geyser—that world's wonder, named with Niagara and the Victoria Falls. The absence of roads must aid the monotonous appearance of the country, which is doubtless also assisted by the construction of the Icelandic *baers*, or houses, which are built sometimes of earth only, sometimes of earth and stone, and have a turf roof, so that in the summer, when they are covered with green, they can scarcely be distinguished from the adjoining fields. Timber is so expensive to import and carry up the country, that it is seldom seen; and even the clergy and well-to-do farmers have not wooden houses, though they generally contrive to have one room floored. The poorest of the population dwell literally in earthen burrows, though, instead of being underground, they are above it. This is not an inviting description of a peasant's baer: 'The interior, which was very low and dark, formed only one room, one end of which was occupied by two bedsteads, the two side walls, with a small oblong table; and at the other end of the apartment was a store-room, where provisions, wool, moss, &c., were stored away. The fireplace, marked only by a few stones, was in the middle, opposite the entrance. This house possessed no floor, and no other ceiling than the rafters, which sustained the roof of turf. Light was admitted through a couple of small apertures in the roof; and the house was so low that the crossbeams which supported the rafters reached to the middle of the visitor's chest as he stood upright.' It seems wonderful to us that the poor should voluntarily dispense with the comforts of air and light, from which poverty does not debar them. We have heard the horrors of Irish and Scotch hovels, in this respect, accounted for by the fact, that the need for warmth is predominant; perhaps this also explains the Icelandic baer. The dirt in such places is frightful; and though the poor people are hospitable, and anything to eat and drink is not to be despised in a country where there are no inns, it requires real hunger and thirst to induce one to eat under such circumstances. Coffee in Iceland is as universal as tea in Russia or in the bush; the coffee-kettle stands on the fire all day long, and the coffee is excellent. It is the national beverage, with the addition of brandy. The latter is in very reasonable requisition, as damp is a normal constituent of life in Iceland; there is every facility for it afforded by the climate, and neither the roofs nor the walls can keep it out. In one part of the island, fireplaces in living-rooms are absolutely unknown, and the people live in darkness, the houses having no windows, in a loft over the cow-house. Turf and manure, animal and fish bones, and dried sea-weed, form the fuel in use. In houses of the superior class, the guest-room is furnished with a bed, a table, and a few chairs; but the family-room furniture consists only of beds fixed to the wall, and capable of holding two or three persons each. Every one eats his meals sitting upon his bedstead, with his plate and porringer before him. Looking-glasses and chests of drawers are a great rarity.

The national manners are simple and polite; the national tastes are grave; the national female dress is uniform and unostentatious, serviceable and modest. It consists of a tight-fitting, knitted woollen bodice, of dark colour, with tight sleeves buttoned at the wrist, without any decoration; and a wadmel skirt. A striped apron, generally green and red, enlivens this costume, which is completed by the *höfa*, a characteristic head-dress. It is a small black cap, fastened coquettishly across the temples, and adorned with a long silken tassel. This style of dress is worn by all classes alike, and by married and unmarried women, so that, on meeting an Icelandic woman, it is difficult to define her rank in society. Of course this rule only applies to the country. In the towns, the higher classes dress like other Europeans, perhaps more decently and rationally, but they will not be very long behind the age. The state costume is more barbarously splendid than that of the Hungarians, and must be imposing, stately, and beautiful. The Swedish professor maintains that the Icelandic women are not ugly, and says they have beautiful hair. Both men and women have remarkably prominent eyeballs. The men are not so good-looking as the Swedes and Danes; they are strongly built, with long waists and short legs.

The magnificence of nature contrasts strongly in the remote portions of the island with the dulness and squalor of the lives of the natives. Everything is grand, gigantic, superb, though the whole space for the display of these immensities is comparatively small. Mountains that hide their snowy heads far up in the sky; boundless sandy plains; swift foaming rivers; steep, rocky, perpendicular slopes; tremendous roaring waterfalls; deserts of lava, of ice, of snow, of sand, of stone; the boiling springs which tell of the wondrous chemistry within the bosom of the earth; and beyond all, seldom out of the traveller's sight, on every side the wide surrounding sea. The effect of this piled-up titanic grandeur, whose scale is so exaggerated

Digitized by Google

that distances are both diminished and increased, must be very remarkable. The lava-fields which stretch away from Reykjavik form a suggestive track for the traveller towards Hecla, and the way is rich, not only in historical records of the terrible fiery floods, and the appalling convulsions of nature which have had their way there, but in wild and wonderful legends. The legendary lore of pagan Iceland must have been amazingly fruitful and picturesque, for so much of it to have survived among so matter-of-fact and coldly practical a people. The professor intended to have visited the crater of the Skaptar volcano, which was the vehicle of the awful eruption of 1783, when it discharged the largest lava-stream ever known, and which has never yet been reached. The account of this fearful occurrence is painfully interesting, including, as it does, details of suffering which do not occur to our minds as naturally ensuing on a volcanic eruption in a place which seems to us so desolate and remote as Iceland. That the fiery mountain should destroy and overthrow, and its cruel might be devastating in the regions under Vesuvius and Etna, is intelligible, but we fail to realise what the Icelandic volcanoes do, in the way of inflicting terror and misery and death. The eruption of 1783, when the lava from Skaptar piled itself to a height of six hundred feet in the ravine, and spread itself over the plains a hundred feet deep, put a stop to the fisheries, because the boats could not go out in the thick smoke which enveloped the entire district for three months. There is a terrible picture in the mere words. The *débris* that fell into the lakes destroyed the trout; the egg-harvest was lost, because the birds were driven away by the eruption; and swans, which used to be caught in great numbers, in the moulting season forsook the place. The grass was destroyed; and the wild plants, such as angelica and Iceland moss, used for food, were buried under the ashes. Early in the winter, the cattle began to shew signs of disease, of a nature never observed before, and peculiarly dreadful and painful. The sheep suffered beyond all the other animals, and died in great numbers. Then came the turn of the human race. The fetid state of the atmosphere, and the impurity of the water, produced a terrible dearth, soon felt with appalling severity. With famine came pestilence, in the shape of a frightful disease, resembling the worst form of scurvy. In the little district of Skaptarfell alone, one hundred and fifty persons died early in 1784. In one farm, all the inmates were attacked, so that there was not literally a single person left to nurse and succour the infected; and the dead had to lie as they were struck down, till news of the disaster was conveyed by travellers to other places. Many of these had had for their only subsistence the flesh and milk of the diseased animals, or old hides that had been boiled down. This was one of the most terrible epochs in the history of Iceland.

Dried fish, smoked mutton, and bread (made not in ovens, but in iron pots), of which very little is eaten in Iceland in comparison with other countries, is the staple food. The poorer classes use a mixture of oil and tallow instead of butter, and all Icelanders are addicted to the eating of fat. A fable, with an implied moral, is founded upon this national predilection: 'A man, named Fusi, seated himself one Christmas-eve at a cross-road, to wait for the elves, who come at this time with their riches. It is only necessary not to speak to them, or take anything from them during the whole of the night, otherwise they will vanish, and all their riches are turned into stones. But when the sun rises, one must say: "God be praised, now it is morning in the heavens!" and the elves vanish, leaving their stores behind them. Fusi, then, was sitting by the cross-road, and an elf came to him, and asked him if he would not partake of a piece of fat. The temptation was too great to be resisted, and he replied: "Fat have I never refused!" But alas! fat, elves, and all vanished from his sight.'

The professor believes that the extent of forest in Iceland, in the pre-historic period, has been exaggerated. The forest limit in the interior of Scandinavia is two thousand five hundred feet under the limit of snow, and he believes this to be the limit in Iceland also, and that forests could not have existed on the table-lands. He considers that Iceland lies above the region of fir, neither fir nor pine growing there, but only the dwarf and common birch; also because its flora is exclusively alpine; and finally, from the low altitude of the limit of snow above the sea. The physical geography, the geology, and the mineralogy of this wonderful country, are full of interest: the little space devoted to them makes one wish for at least another volume. Whale-fishing, which must be unspeakably disgusting in reality, is always interesting in books, and in a description of Iceland has naturally a prominent place. Naturalists hold that the whale is not plentiful on the coast, and it must be remembered that a very little whale goes a very long way. The islanders are fond of a dish made from an intermediate layer of its flesh, which lies nearest the bones, but is not quite blubber, called *rengi*. This delicious *plat*, which is first boiled, for the extraction from it of lamp-oil, then soused in sour whey, is said to resemble 'something between pork and the muscles of a bullock, is of a whitish-yellowish colour, and tastes like pickled pork.' The professor asks: 'Can I give a more appetising description of it?' Hardly.

The Icelanders supply the Spanish market with dried fish, which is called *klip*. This is cod-fish, not salted in barrels, but in open heaps, so that the brine runs off; it is afterwards laid on the rocks to be dried. Stores of this preparation are kept in every house for winter consumption. The fish is first beaten on a stone, in order to separate the meaty fibres a little, for it can then be more easily divided into small pieces, which each person accommodates to the size of his mouth and the state of his teeth; for after the fish has been beaten, it is ready for the table. It is then torn in pieces with the fingers, which here usurp the place of knives and forks. The fisheries are much neglected, the French reaping almost the whole of the rich harvest of the seas. Farming is very imperfect, and the products of the country in minerals are only beginning to attract attention. The people are unprogressive and reserved. They regard emigration with horror, and emigrants as traitors. There are few mechanics in the country. The fine arts are not cultivated; a taste for the beautiful is not developed. There are no national songs, and dancing is very rare. There is one clever young painter, but he is not encouraged. The only art which finds patrons in Iceland is that of working gold. Even in this, all the patterns are memorials from olden days; and the wrought gold is used only on the national state costume. Few

Icelanders are students of nature, though they live amid her wonder and sublimity. When students at all, they are theologians. On the whole, they are an unsatisfactory people, respectable and staid, but wanting in grandeur, and the ideal qualities which make a race interesting. The political position of the country is vague: no one seems to know what its precise relation to Denmark is. When the mines are about to be worked by great companies, the position will be defined, no doubt to the satisfaction of the bigger parties concerned. At present, Iceland is sometimes called a colony, sometimes a province, and finally, a new word has been coined, and it is called a dependency. The Icelanders acknowledge no such title, but simply call it 'The Land.' Not a wholly unprosperous or contemptible little country, it has fallen into obscurity, and it is hard to believe in what it was from the beginning of the twelfth to the middle of the fourteenth century, when it produced that remarkable, that splendid literature, which is justly Iceland's pride, 'and which,' says the professor, 'has been instrumental in preserving, up to the present day, the knowledge of that language which our forefathers spoke—a language which is of the last importance to the proper understanding of our own tongue; while at the same time the historical portions of this literature, the Sagas, are the sources of the ancient history of the countries of the north, whether as regards actual occurrences, customs, or morals.'

To the pages of that ancient literature we must turn, if we would find congruity between the dwellers in Iceland, and that marvellous land of the burning mountains, of the boundless ice-fields, of the grand treeless wastes, Saharas of the north, of the boiling lake and the Great Geyser.

A PACK OF DEMONS.

I KNEW the Chieveley Pack—as fine a pack of hounds as ever ran a fox to earth. Everybody said so, and therefore the assertion will not bear contradiction. I never saw, for my part, that they were more in number, or finer-looking, or had better runs than the Pytchley, or the Puckeridge, or Essex, or Southwold hounds—packs that I have often gazed upon, when a southerly wind and a cloudy sky proclaimed a hunting morning. I knew Jerry Ball, too, the old huntsman—as dry an old stick as ever blew horn, or curled the long thong of his whip round some truant young hound's flank. Proud of his pink was Jerry; and when, with a fresh season, he came out with what Captain Castigan used to call a 'new shoot,' I don't think that he would have doffed that black-velvet-covered head-case of his to a prince. He was like his horse, and a better-matched pair never went to meet. They were both of the style that sporting-men would term 'weedy;' for Jerry was dry and withered, and had a blue nose, while his back rose up like that of a wet mouse. As for Jerry's legs, they seemed regularly to have grown to fit round the ribs of his old hunter, so that they seemed almost to belong to one another—Jerry and his horse; and if anything was to be cleared, or gone through, those were the two who would do it. Jerry certainly had two eyes, but one was half-closed, from the lid being drawn over it in a perennial wink: and here again there was a likeness; for Old Bones, his horse, had also lost one eye, while, as if in imitation of his master, he would hang his head down, set up his back, and crook his old legs in the most extraordinary manner. See him then, and you would value him at knacker's market-price; but that would be through ignorance, for you did not know him. Languid swells on satin-coated steeds said he was a disgrace to the Hunt; but the old master would chuckle to himself, and his huntsman retained his steed. Wait until he was called upon, and then see what Old Bones could do; he would throw up that old coffin-shaped head of his, wag his ragged old tail, curve his spine for a few moments, and perform the feat known amongst 'horsey' men as 'bucking;' and then he went off; and if you kept steadily at the tail of the pack like he did, right through the run, why, all I can say is, that you were well mounted.

One wit of the followers of the Hunt compared him to an unfinished horse, saying that the framework was there, but it had not been clothed. However, Jerry and Old Bones went well together; and everybody agreed that there was no such pack of hounds anywhere as those yclept the Chieveley.

I had the misfortune at that time to dwell near the kennel; a handsome, brick-and-stone faced building, that would have been no disgrace to a gentleman if he had pointed it out as his shooting-box: pleasantly situated on the slope of a hill, with a splendid sweep of woodland scenery around: to the right, the broad lake, glistening through park-like patches of beech and oak; to the left, the tall sand-hills, crowned with many a darkling whispering grove of pines; while in front, far away till the distant dim blue hills cloud the view, one long stretch of valley. A rare hunting country; no ring-fences of wire here; no stone walls; but plenty of tolerable hedges and ditches, with now and then a stiff timber-fence, a bullfinch, or a brook to lend a charm to the tract.

One nuisance to me in this propinquity was the frequent arrival, and consequent passage past my gate—not of the butcher's cart with joints, but of what took its place—namely, that of the feltmonger of the neighbouring town, driven by one Dicky Bird, a strange-looking, dwarfish creature, whose duty it was to unclothe dead horse, cow, sheep, or lamb for the tannery; to cut up the animal for the sake of its tallow and glue-making material, and then cart off the flesh in large lumps to the kennel; and I can say, that in summer the odour given out by this Bird of prey, the cart and contents, was anything but desirable.

However, the hounds had to be fed; and the lumps of meat were forked out, and at due time, and in prescribed quantity, distributed amongst the members of the pack.

Hounds will be hounds; and at times, there would arise such a demoniacal din, such a howling and yelling, as would make the listener toss in his bed. Why, I have slept with those demons howling in

Digitized by Google

my ears, and dreamed of such horrors that it would freeze your blood; while the worst of it was that you could not get used to the noise. You might accustom yourself to one particular howl, and bear with it pretty tolerably; but before a week had passed, you would find that some genius, proud of his noise, had invented a new solo in some horrible minor key, to which he would give vent the first fine night, with *da capo* unlimited; when, as if either in ecstasy or horror, the whole pack would join in chorus, as Captain Cuttle says, 'with a will;' and then it was sleep no more, for sleep was banished. Well, in time you would get over that; but there would come another, and another, and another—all perfectly new chants, with a heavy chorus attached; and it was quite wonderful to what a pitch they carried variety. I grew in time to know every hound by its noise—Gaylad, Juno, Merrilegs—all of them; or, at least, I believed that I did, and often wished that I did hunt, if only for the sake of having a long-lashed whip, on purpose to lay about me well, when occasion served, though at last they completely vanquished me, those tormentors did.

There came a night when the howling was something unbearable; and even now, when I recall it, a cold shudder creeps through my frame. The pack had been very quiet all the evening, and I was congratulating myself; for the wind set dead down upon my place, and if there had been a noise, I should have had the full benefit. But my reprieve was not for long. I had just looked up at the timepiece on the mantel-shelf, and seen that it wanted yet a quarter of twelve, so, giving the fire a friendly poke, and putting on just one more knob, I settled back in my chair for just one quarter of an hour before bed.

I had hardly read a line through before there came a whimper, and I shuddered in dread of what was coming, since experience had taught me the meaning of those little alarm-notes. Then came a howl in C major, followed in about twenty seconds by another in E minor; then there was a chromatic scale sung half-way through, but evidently broken in half for want of breath; then, without cessation, came bark, bay, and howl of the most outrageous description. Please to bear in mind that it was of fifty-dog power, while every brute was exerting himself to the uttermost, and I was only about an eighth of a mile distant.

Evidently, it was too much this, even for poor old Jerry; for, after closing my book in despair, and making a couple of cotton-wool plugs ready for insertion where sound enters, I suddenly heard a fierce yelping take the place of the barks and howls; and, in imagination, I could see old Jerry, whip in hand, laying about him most vigorously, making the long twining thong wreathe and twist about the flanks of the howling fiends who disturbed my rest; and I mentally determined to ask the old man to take a flagon of home-brewed the next time he passed my way.

Then came peace; and once more calling upon imagination, I saw Jerry leave the kennel, and enter his cottage, preparatory to going to bed. Thinking the old man's plan sensible, I rose, and followed his example; but my head had hardly touched the pillow, before the din recommenced, apparently with tenfold fury. I drew the curtains—I stopped my ears—I put the clothes over my head—I resolutely set myself to go to sleep; but all was in vain; and, at last, sitting up in bed, I was trying to recollect a few good round canine Eastern oaths wherewith to curse the whole pack, when my features relaxed into a grin; and I chuckled and rubbed my hands; for, plainly enough, in the silence of the night, I could hear that Jerry had come down again, and was plying that whip of his right and left, and most effectually too, from the howling it produced.

Silence once more; but sleep seemed chased from my eyes; and but for the badness of the habit, I should gladly have had a smoke, to calm my ruffled feelings. However, I lay, I should think, for about a quarter of an hour awake, when there was a little outbreak of yelling, just enough to rouse me up a little, and keep me awake for another quarter of an hour; when, after perfect silence, the noise began again worse than ever—howl, yell, bark, bay—they seemed to be excelling themselves; and gnashing my teeth with rage, I lay still, and composed an artfully worded advertisement to send to the morning papers, offering this desirable bachelor-residence *upon lease*, with immediate occupation, setting forth the fishing, shooting, and hunting; but not mentioning the kennel, as a matter of course; and then I grinned as I anticipated trapping some unfortunate wretch, with hunting proclivities, into dwelling there, and suffering my tortured nights.

But the storm still kept on for a few moments, after I had determined where applicants were to address, and I was just saying to myself: 'Why the dickens doesn't he get up and thrash them?' when once more I heard the yelps and cries as the whip fell amongst these disturbers of my rest.

'Give it them well this time, Jerry,' I muttered; and I was thinking that if I had been there, I should have applied the but-end as well as the lash of the flagellator, when all at once the yelling changed to another familiar sound—that of the growling, worrying, and snarling over food. 'Ah!' I thought, 'bribing them into silence, eh? Best plan, perhaps;' and as I mentally saw the old fellow pitchforking leg and thigh bones into the kennel, I could picture him giving two ravenous brutes toppers upon the skull with the fork-handle.

'That was a sharp one, at all events,' I muttered, as apparently following a blow from the heavy staff, there floated out upon the night-air a horrible cry, and then another and another, different to any that I had heard before, but plainly enough produced by suffering, as they rang out above the fierce worrying sounds.

'They 'll be quiet now, at all events,' I thought, while I pictured the grim old man belabouring the dogs in his anger at being fetched out of bed; and then I fell asleep, to dream that I had let my house, and was dwelling in a sunny part of the country, where there was neither cat, dog, nor east wind, when I was awaked by a knocking at the door, and a noise I knew well enough as that of a neighbour, asking me to get up and come down.

'Here; come in,' I exclaimed, pulling the string

Digitized by Google

of the night-latch; and, coming in, he hurriedly informed me of the object of his visit.

'It's not seven yet,' he said. 'My man told me; came and knocked me up; and I thought I'd do the same by you before I went. Horrible, isn't it?'

'Frightful!' I ejaculated, dressing as hurriedly as I could; and a quarter of an hour after we were up at the kennel, where we met the old master of the hounds, looking pale as death, and holding a freshly discharged double-gun in his hand, which trembled with agitation.

'I've killed two of the devils,' he said, turning back with us.

'There's no doubt about it, then?' I said anxiously.

'Doubt, sir?' he exclaimed. 'Look here!' And turning into an outhouse where they were laid, I looked for a moment at something, and then turned shuddering away.

No; there was no doubt about it. You remember what followed, when Jehu said: 'Go, see now this cursed woman, and bury her; for she is a king's daughter.' It was almost the same here, for there was little more left of poor old Jerry than of royal Jezebel.

I told what I had heard, shuddering, for I recalled the strange cries, and knew now well enough what they meant.

'He ought to have known better,' said the old master, pointing to a torn and stained rag which a groom had brought out of the kennel. 'His clothes are all by his bedside, and he must have come down in his shirt, and entered the kennel. Animals know you as much by your clothes as by anything else, and they could not have known him when they saw the white figure come amongst them.'

IN THE PORTRAIT-GALLERY AT SOUTH KENSINGTON.

What a strange mystic influence falls
Upon me from these gazing walls.

Silent I feel strange mysteries
Look down from these beholding eyes.

I seem to breathe a doubting breath
Of death in life—of life in death.

What are you, painted shades that seem
Day wanderers from the land of dream!

Life-seemings that have found your way,
From worlds we know not, back to day.

Whence is the awe with which I tread
Through your long ranks, ye living dead!

The felt half-fear that haunts these aisles
With once-known wisdom, once-loved smiles!

With semblance grave or gay as when
Not painted lines you lived, but men.

Come you, we ask, from awful glooms,
Acquaint with secrets of the tombs?

Bring those lips power, to us, to tell
Of those new homes in which you dwell,
Of that great secret, in our turn,
We from the unseen too shall learn?

Even as I gaze, ye seem to me
The glasses of eternity;

In your unchanging steadfast gaze
Lives not the life of mortal days.

We come as ye came; we shall go
As ye went; change ye will not know.

Immortals, in our mortal air,
Our doom of time ye do not share.

Down to its depths the dim past drew
Your fellows, but it gulfed not you.

Barks from far seas of ages gone,
Ages to come will float you on.

Deaths, that are lives to us through art,
Would ye your knowledge could impart.

Watchers of life, would you could say
Your thoughts of us you see to-day.

What think you of our times' vain strife!
Of all we fleeting shades call Life!

From you, impassive, should we wile
Or wrath or pity, frown or smile?

Or both? Methinks that passing well
Fancy your utterance can tell.

See not, those unpronouncing eyes,
Wise men half-fools, and fools half-wise?

In men, find they not older boys,
Busied with games, and pleased with toys?

Puppets, through time, our parts we play
As you did in your little day.

Ah! too, like yours, our sports will cease;
We too, like you, shall pass to peace.

To peace? O say, to peace or strife?
Or, change to change, from life to life?

Who knows? Death, that our sight shall clear,
When we shall pass, and leave you here,

With watching eyes, and lips still dumb,
To times to be, and men to come.

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 264. SATURDAY, JANUARY 16, 1869. PRICE 1½*d*.

DAISY'S CHOICE.

IN FIVE CHAPTERS.—CHAPTER I.

It was a beautiful road, leading through a green, undulating country, rich in corn-fields and woodlands. It was bordered by tall hedges, of which the hawthorn blossom was over, and had been succeeded by the delicate pink of the wild roses. The sloping banks were rich with fern fronds of the commoner sorts, but full of grace; they were sprinkled, too, with the tiny heart's-ease and the blue veronica. The road was deeply cut in some places, and then those banks were exquisite walls of greenness, and the wild hedge above made quite a shadow for travellers. It was as sweet a place as you could find in England; and at six o'clock on a May morning, with a blue, unclouded sky, and the birds making jubilee in the woods, and faint, delicious odours coming on every breath of wind, it was an exceedingly pleasant place to linger in.

So seemed to think a gentleman who was riding very slowly between the deep banks and shady hedgerows. He was a tall, powerfully built man, and he rode a strong, useful horse; but both horse and rider seemed pretty well tired out; and no wonder, seeing they had travelled a good many miles together, and the latter, at least, had not been in bed all night. The man rode with his head drooping a little, seldom looking up at the beauty by which he was surrounded. He had seen it all very often before, at all seasons of the year, and all hours of the day and night; for he was that hardest worked of all people—a village doctor. A turn in the road brought him suddenly face to face with another person, and he checked his horse. 'Daisy!' he said, and the tired look disappeared from his face in an instant. She was a very young girl, hardly more than seventeen, a good twenty years younger than the doctor, who was nearer forty than thirty. At the first glance, you could not help seeing that she was beautiful, and more than that. She had that picturesque grace which one often sees in pictures, and so seldom in real life. Her slender, undulating figure; her free, natural gestures; every turn of her head and pose of her body, were thoroughly graceful. This was what first struck every one in Daisy Barton. People always said of her: 'She is like a picture.' She was simply dressed in a light-blue cotton gown and a broad hat; yet everything about her was so fresh and delicate, that she might have gone anywhere dressed just as she was then, and no one would have thought of finding fault. She had crisp, wavy hair, that curled in her neck, and would not be brushed out straight. The only approximation she could make to the prevailing fashion was to tie it in a bunch of curls behind, with a blue ribbon. She had sweet, lustrous blue eyes, clear as those of a child; and she had a sensitive, flexible mouth. It was a face you could not soon weary of, for its expression was so constantly varying, and you were always learning something new in it. It would be beautiful, even after its owner should be old, and when the sunny brown hair should have become white; for those clear eyes could never lose their purity, and the sweet smile would linger till the coffin-lid was shut on it.

The doctor got off his horse, which stood patiently beside him while he put his arm round Daisy, and kissed her very gently. She turned and walked with him, he keeping one arm round her, and throwing the bridle over the other.

'I did not expect to meet you out so early,' he said.

'Nor I you,' she answered. 'The morning looked so lovely when I opened my eyes, that I jumped up. It would be a sin to sleep away those bright hours; they are the sweetest of the whole day. There is a sort of flavour about the morning air that is at no other time. Don't you think so?'

'Yes,' he said, smiling down at her. 'But I did not feel it till you came.'

'I wonder if you see things with the same eyes as I do, doctor?'

'Why—no. I see them with my own.'

She laughed softly. 'That is not what I mean. Is not all this lovely?'

Digitized by Google

They had climbed slowly out of one of the deep cuttings, and had reached one of the high points of the road, where they could command a view of green corn-fields and wooded slopes. Below them lay the village of Thornregis, its white houses gleaming in the sun; and past it the Drew glided slowly between its luxuriant banks, crossed by its gray old bridge. Far off, a dim blue line marked the sea, and they could trace the windings of the Drew nearly till it was lost there.

The doctor stood still, and looked round him gravely. 'It is very beautiful: a man must be blind not to see that. Yet, I don't know that I feel about it just as you do. You see, I 'm a stupid old fellow, Daisy, and I think so much about other things. I believe the most beautiful thing in the world to me is your face, my darling.'

Daisy was silent. She did not pay any attention whatever to the compliment, albeit he was not given to making many. They walked on again, down hill now, passing from the opener country into a wooded dell, where the village was again lost sight of, though they were approaching it more nearly. When she spoke, it was of something else that he had said. 'You are not stupid; I know better than that. You are very clever about your own profession, and I know you have written books that are thought much of, though I can't understand them. And you are very kind and good; every one knows that.'

She said this as much to herself as to him, and as if speaking for her own comfort. He said nothing, but looked down at her very tenderly. No one could doubt that what she said of Dr Carleton's goodness was true, who looked at his face. It was a strong face. Strength lay in the broad brow; in the massive jaw; in the keen, steady gray eyes. It was a face which all sick people and all poor people instinctively trusted, it was so gentle and wise. He was, as she said, clever in his own profession; more than merely clever; he was greater in it than she could know.

'Have you been up all night?' she asked.

'Yes; I needed to be.'

'You must be very tired?'

'Not now. I was, a little ago.'

'Ah, how hard you work!'

'Not harder than many others; and I am strong. I 'm good for nothing except hard work, you know, Daisy.' He spoke lightly; yet there was a shadow, hardly perceptible, both on his face and in his voice. They were silent for a little, till his eye was caught by a pretty blue-and-gold volume which she carried in her hand. 'What have you been reading?' he asked, taking it from her, and turning over the leaves. 'Poetry—Byron. Child, I am not sure that this is good for you.'

She looked up at him with her blue, innocent eyes. 'Why not?' she said wonderingly. 'It is very beautiful.'

'Is it? I have heard people say so, who understood those things better than I do; but there may be poison in it nevertheless.' He glanced at her face. 'But I daresay it won't do you much harm—not the sort of harm it might do some.'

He was right; it would not do her much harm in the way he meant; her nature drank in the beauty, and let the evil roll off, as dew from a leaf. Yet, as she read it, she began dimly to comprehend that there were depths of love and passion which she had never dreamed of, and which half-frightened, half-fascinated her. Had some drops of the poison entered her mind when she began to think the doctor and his work rather commonplace, and vaguely to wish that there had been some different, some more exciting element in her life? She was so very young, and she hardly knew the worth of an honest man's love, or guessed that even in its quietness lay its depth and strength.

'By the way,' he said, as he gave her back the book, 'there is some one coming down here whom you will like to see. I used to know him long ago, but we have taken such different lines since that, I hardly thought we would cross each other again. But he is quite in your way. Have you ever heard of Gerald Vivian?'

'The poet?'

'I believe he has written something or other.'

Daisy's face flushed, and her eyes brightened. 'You don't mean to say that he is coming here?'

The doctor checked his patient horse once more, while he fumbled, first in one pocket and then in another. 'I should have it somewhere.'

'What is it?' said Daisy impatiently.

'A note I had from him. Perhaps I left it on my desk. He says—— Ah, here it is.'

She took it eagerly, and read:

DEAR CARLETON—I have lost sight of you for so long, that I did not even know you had settled at Thornregis, till I heard so casually the other day. I hear that the Drew is a good trout-river; and as I have been feeling knocked up lately, I think I will run down, and stay a week with you, if you will have me. We 'll have a talk over old college days and chums.—Yours truly,

GERALD VIVIAN.

'Oh!' said Daisy, drawing a long breath.

'Why, child, you look quite excited,' said the doctor laughing.

'No wonder. I have been so fond of his poetry, it is so lovely; and now, to think of seeing him! But I shall be too much afraid of him to speak to him, I 'm sure.'

'You need not: he is not at all formidable; at least, he was not, as I remember him.'

'Of course, you have written?'

'Yes. He may be here to-day or to-morrow.'

'And you have really never read his poems?'

'No, indeed.—You see,' he said humbly, 'I've so little time. And besides, even if I did read them, I don't think I could understand them.'

Daisy sighed; the doctor glanced at her sidewise, and sighed too. 'You are my poem,' he said.

She gave him a beautiful look, and laid her hand on his arm, and he looked satisfied.

They were entering the village; but they walked on slowly, still together. Every one knew the doctor, and every one had known Daisy all her life; it was known also that they belonged to each other, and people looked on them with approval. It seemed the most natural thing in the world that she should marry him who had watched over her motherless childhood; it was only making a little closer bonds that had been very close before. The villagers were coming to their doors to look out at the bright May sky, and they got many a kindly glance and nod as they passed. They went up the long street, and stopped before two houses that stood close together. Daisy would not have far to go when she married the doctor. Her father's house was an old-fashioned one, standing with its gable to the road, and with a wide court in front

Digitized by Google

of the door, laid out prettily in turf and flower-beds. On the other side of this flower-garden was the doctor's house, which stood in the usual fashion, with its front-door to the street, so that its gable formed the boundary of Mr Barton's garden. In this gable, on the ground-floor, was the room which the doctor called his surgery, and where he constantly sat when at home. It was a pleasant room in itself, with a heterogeneous sort of odds and ends of furniture that had accumulated there during the years of the doctor's life at Thornregis. The medicine-bottles were all stowed away in a great carved oak press, which filled one end of the room altogether. Another side was covered by book-shelves, containing a very professional library. There were comfortable arm-chairs and sofas, and curious old escritoires scattered about; the doctor had a fancy for picking up bits of old-fashioned furniture. The room was sunny, and altogether had a homely pleasant air about it; and more than all, there was that wide deep window looking into Daisy's garden. The doctor's writing-table was drawn close to it, so that by merely lifting his head, he could see her go backward and forward among her flowers. Often it stood wide open, so that they could carry on a disjointed sort of conversation while she raked and watered. People at Thornregis were too unsophisticated to think evil of any such proceedings.

It was all very charming and very natural, and the doctor was thoroughly content. Perhaps it was just too natural for Daisy to be quite satisfied with it, and had come about too easily in the ordinary course of things. There seemed never to have been any change in her life; and when she married, there would be very little. There would still be the old village, the people whose faces were all familiar to her; she would have her old garden, where every plant was a friend; and she would live with the doctor, whom she had known all her life. It was to be very peaceful, very happy; but the young are restless, and crave change. They would fain leave the old everyday things, and go out into the world, where all is new, and vague, and unknown.

CHAPTER II.

The doctor was in his surgery, but not alone. He was busy doing something with bottles—going for them to the oak press, and bringing them to the table near the window, where the processes of examining, shaking, and putting mysterious substances, which had been weighed critically in a pair of small scales, into them. He was watched by a young man who lounged in the window, and who looked on with a look half-curiosity, half-amusement.

'Frankly, now, Carleton,' he said, 'do you not find it rather slow work living down here? It is a pretty enough place for a week or two; but for the whole year—to live one's whole life in, I don't think I could stand it.'

'The difference is,' said the doctor coolly, 'that you are an idle man and I am a busy one.'

'But with your abilities, it seems to me that your being buried here is simple waste.'

'My work is here.'

'Yes; but an inferior man would do the work as well.'

'Hardly. Do you think that the health of poor people matters less than the health of rich ones?'

'Well, no; not if you put it in that way. But I was thinking of you.'

'Thank you; but I am content. Are you?'

Mr Vivian did not answer; he turned to the window, and looked out. The doctor went to his oak press to search for something, softly whistling a few bars of a tune the while.

'Whose house is that opposite?'

'Mr Barton's.'

'Isn't it rather disagreeable to be overlooked so? They must see right in at this window.'

A curious little smile played about the doctor's mouth. 'I've never found it so.'

'It is a pretty little garden, though,' said Vivian, leaning his arms on the window-sill.—'Why, Carleton,' he went on with a sudden change of tone, 'who is that?'

The doctor glanced out. 'That is Miss Barton.'

'What a lovely girl!'

He drew back behind the window-curtain, and watched her. Daisy was in a simple white muslin, and her curly hair was tied with blue ribbons. She had come out, as she did every evening, to water her flowers, and she moved slowly among them with her little watering-pot in her hand. She glanced up at the surgery-window, and seeing only the doctor, gave him one of her brightest smiles.

'Are you busy?' she said, as she came near the window.

The doctor held up a bottle by way of answer.

'Oh, you can leave that just now; this is such a lovely evening, and I want you to help me.'

He smiled. 'May I bring some one with me, then?'

She drew back, flushing. 'I did not know he had come.'

'Will you come out?' said the doctor to Vivian; and they went round by the front-door, and in at Mr Barton's garden-gate. Now, although Daisy's garden was overlooked by the doctor, he had that privilege all to himself, for it was completely hidden from the street by a thick and tall laurel hedge. The gate was made through this hedge, so that one entered the garden under a green arch.

'This is Mr Vivian, Daisy,' said the doctor, going up to her; and they bowed to one another, Daisy not venturing to lift her eyes. Her cheeks were still flushed, and as she gained courage, she gave a swift glance at his face with her bright blue eyes. As she did so, she thought it was one of the most beautiful faces she had ever seen in her life; pale and sallow, but with finely cut features, and lighted up by a pair of wonderfully dark and lustrous eyes—eyes that seemed unfathomable in their depth, and that could be fiery, dreamy, sad, all by turns. When he spoke to her, it was in a voice soft and musical, very different from the hard dry tone he had used in the surgery. There was no undertone of discontent now. 'This is a sweet place, Miss Barton. What a lovely little nook you have; it is like some convent gardens I have seen.'

Daisy ventured another glance at him. The poet was not so very formidable after all.

'It is very quiet,' she answered; 'and there is a beautiful view from one part. Would you like to see it?' she asked timidly.

'If you please;' and she led him away from her flowers, along a shady walk, that took them quite to the other side of the garden, where a low wall separated it from the river-banks. Sitting on this wall, they could look across the Drew, and away

Digitized by Google

over sloping meadow-land, to the distant blue line of sea, into which the sun was just then sinking in clear golden radiance. Vivian looked at it in silence; he had too much real poetry in him to say much. Daisy looked at him, as he stood with his face turned towards the sunset, the rich glow resting on it. He turned suddenly, and caught her admiring, reverent look, and it pleased him. Mr Vivian was accustomed to a great deal of admiration, and his fine dark eyes had done a considerable amount of execution; but his appetite for worship was by no means satiated. Besides, there was something piquant about Daisy: she was very beautiful, and his critical eye noticed the rare grace of her motions. As he watched her, leaning against the old wall, her head slightly bent and her eyes drooping, with the sunset lighting up her wavy hair, he thought he had never seen any one at all like her before. She was not the sort of person one might expect to meet in an out-of-the-world place like Thornregis.

The doctor, who had often seen Daisy's favourite view before, had been looking round her garden to see what he could do for her. He found rose-trees that needed nailing up, and called her to ask where the hammer was. She went into the house for it, and then stood by the doctor, giving directions while he nailed. Vivian felt annoyed that their *tête-à-tête* had been interrupted, and her attention directed to other things; he was one of those people who are accustomed to be first in almost any company, and felt ill used when he was not being taken special notice of. He looked at the early rosebuds, and smelled them discontentedly: Daisy unconsciously mollified him by pulling one of her cream-coloured tea-roses, and giving it to him. He gave her one of his most beautiful smiles, and put it in his button-hole. She did not think of giving one to the doctor, though he was working for her. She had grown so used to have him as a slave, that it seemed only natural that he should do the work, while Vivian stood and looked on with his beautiful dark eyes.

Presently, Mr Barton came out to them. He nodded to the doctor, who was now perched up on a ladder, nailing some high branches, and crossed to where Vivian stood. He was a tall, slender old man, with a fine face, and long white hair falling on his shoulders. He said: 'Mr Vivian, your coming is quite an event in the life of this little girl of mine. I scarcely think you can have a more fervent admirer than she is.'

This was pleasant to hear, and Vivian bowed and smiled. Daisy blushed, and whispered: 'O hush, papa;' and then murmured something about going to get tea ready, and disappeared through the ivy-covered porch.

Vivian thought it was all like a scene in an old romance: the quaint garden, with its high laurel hedge, and clipped yews and box-trees; its gay flower-beds set in the turf, and one or two vases filled with creeping-plants; the gray, ivy-covered house; the courteous, white-haired gentleman who was talking to him; and then Daisy came to the door, and standing there with her white dress and bright hair, surrounded by the frame of glossy ivy-leaves, put the finishing touch to the picture.

'Will you come in to tea?' she said; and the doctor came down from his ladder, and they all went in together. Inside the house, there was the same air of quaint picturesqueness: the drawing-room smelled of the dried rose-leaves which filled the old china jars that stood on old-fashioned cabinets; the furniture was all old, and its colours were toned down into soft harmonious tints. Daisy sat at the tea-table, and poured the tea into little old china cups. She looked very young and bright herself, and seemed to make a sunshine in the room. Altogether, it felt to Vivian like the rest he had wanted; he was tired of the noise and whirl of London, and of its conventional beauties who lionised him: this was something quite fresh and charming.

After tea, he asked Daisy to sing, and she went to the piano, and sang some simple airs very prettily. Then Vivian sat down, and from the first note he struck, he wrapped Daisy's soul in a dream of delight. He had one of those pathetic tenor voices that float in mournful, sweet cadences, that seem to be the very utterance of the soul of the singer. It could be sad, pleading, passionate; it could rise in the upper notes into triumph, and sink down again low, quivering, as if in pain. Daisy had never heard anything like it before; it fairly bewitched her, and she would have sat still for hours listening. When he stopped, she felt as if she could hardly bear the silence; and she begged him so sweetly for another song, and then another, that he sat singing to her till long after the darkness fell. Like most fine singers, it was happiness for him to sing, when he had a listener who could understand him.

The doctor had slipped away, and was out in the dark village street, where firelight gleamed through the unshuttered windows of the cottages. He walked with his head down, and for once his thoughts were those of repining. 'How fascinated she looked, my poor little Daisy. I wish I could sing like that. A man ought to be happy who can pour out the thoughts of his heart so. It is a gift of God.'

He stood still, and looked up to the sky, where the stars were shining out; and as he looked, he felt himself poor and mean compared with the gifted Vivian. Only for a moment; he was too truly noble to indulge long in sickly fancies. He knew he was what God had meant him to be, and that was enough for him. He turned into a low doorway, and went into a little room, where a poor creature lay in pain; and then he forgot all about Vivian, and thought only of his own work.

OATHS OF OFFICE.

Those who have never studied the subject, says Lord Chelmsford, would be astonished to learn the enormous number of oaths exacted, by law and custom, from British officials. These oaths are of two kinds—oaths of allegiance to the sovereign and her successors, and oaths of fidelity in the discharge of official duties.

Although five out of thirteen Royal Commissioners concur in declaring the first-named to be needless in peaceful and prosperous times, and unobserved in days of difficulty and danger, we are not likely to see the oath of allegiance abolished altogether; but there can be little doubt that it will be confined to the great officers of state and the higher judicial functionaries, instead of being required from all ranks and degrees of office-holders. The term office-holder must be taken in its widest possible sense, seeing that it includes ministers of state, the very highest and very lowest legal functionaries, officers of the royal household,

Digitized by Google

members of the Royal Company of Archers doing duty as the Queen's body-guard in Scotland, officials of diocesan ecclesiastical courts, lord-lieutenants of counties, barristers of the Temple, Lincoln's Inn, and Gray's Inn; mayors, aldermen, town-councillors, and other officers of municipal corporations; university authorities, students and servants of Maynooth, Trinity House Brethren; heralds, pursuivants, and messengers of Lyon Office; lay-officers of the cathedrals of Hereford and Wells; members of the Society of High Constables of Edinburgh; poor brethren of the Charter House; directors of the Bank of England, Bank of Ireland, Bank of Scotland, and Royal Bank of Scotland; Commissioners of Income, Land, and Assessed Taxes; officers of the Royal Hospital of Kilmainham, 'for ancients and maimed officers and soldiers of the army of Ireland;' and parish clerks in the dioceses of Rochester, Hereford, Worcester, Peterborough, and Gloucester; to say nothing of takers of the Queen's shilling. To these may be added, if the statutes be strictly interpreted, all Scotch ministers of the Presbyterian and Episcopal churches, dissenting ministers generally, and private chaplains and schoolmasters practising their callings in Scotland.

Of the second class of oaths, many have been abolished, or converted into declarations; but nearly a thousand different formulas remain in use. Many of these are at the best unnecessary; and where the plea of necessity can be plausibly raised in their favour, not a few of them contain promises long since inapplicable to the duties of the offices to which they appertain; while almost all are overburdened with repetition and surplusage. If our judges solemnly promise to exercise their office with impartiality, it is only a mockery to make a lord chief-justice furthermore declare he will not be swayed by filthy lucre, by assenting to such an insulting clause as this: 'Ye shall not take, by you or by any other person, privily nor operte, any gift or reward of gold or of silver, or anything which might turn to your profit, but if it be meat or drink, and that of little value, of any man that shall have any plea or process hanging before you, as long as before yourself the pleas and processes shall be hanging, nor after for that cause ye shall take no fees of any person as long as ye shall be justice but of the Queen. Ye shall not give any advice or counsel to any person great or small in a cause where the Queen is party.' Nor can there be any need for a baron of the Court of Exchequer to swear he will speed the business of the crown before all other; and considering that Q.C.s do now and again appear against the crown, it is ridiculous that gentlemen in silk should bind themselves, without any proviso, to take no fees of any one for any matter against the Queen, although it is not unreasonable that they hold themselves ready to attend to the Queen's matters whenever called upon, and truly counsel her after their cunning. But for an oath-oppressed functionary, commend us to the bailiff of the Central Criminal Court. Upon receiving the bills of indictment, he has to swear that he will faithfully deliver them to the grand-jury in the condition in which he receives them; when the court adjourns in the middle of a case, he has to swear that he will keep the jury in some private place, neither speaking to them himself, nor allowing any one else to do so, upon matters touching the pending trial; and upon a jury's retiring to consider their verdict, he must take an oath to keep them without meat, drink, or firing, and confine his conversation with them to asking whether they have come to an agreement.

The golden-robed minister, dear to the purses if not to the hearts of his fellow-subjects, has to take no less than three oaths upon assuming office; and we cannot better give an idea of the style of oath administered to the great officers of the realm than by quoting two of them. That taken by the Chancellor of the Exchequer, as a member of the court from which he derives his title, runs thus: 'Ye shall swere that ye shall serue well and trewly the kyng our souereign lord in the office of Chaunceler of the Escheker; and well and trewly ye shall do all thyngs that perteigneth unto that office. And ye shall spede the kyng's beseignez byfore all other. And ye shall not enseale any writte of juggment of any other place than of this Escheker with the seall of this place whiles the Chauncerie shall be xx. myle about the place where this Escheker is abydyng. And also ye shall swere that if it fortune you hereafter, by reason of your office, to make any clerkes or mynistres to occupie any office or place within this courte, ye shall make such clerkes and mynistres as ye will answere for at your perill, and such as shall be sufficiant true and entendaunt unto that to them shall appertaigne in spede as well of the kyng's bessignes as of his people, after the forme of the statute in that behalve made in the parliament holden at Westminster the secunde yere of the reigne of Kyng Henry the VJth.

'Ye shall well and trewly serue the kyng our soveraign lord in the rome of Under Treasourer of this his Eschequer, and in the recept of the same. And well and truely survey and order as well the receipts of all sumes of money payed and to be payed to the kyng's use in the seid recept as the issue of the same; and well and truely behave yourself in the same roome.—So help you GOD and all saynts and the Holy Evangelyst!' The second oath, clothed in more modern phraseology, is in the following form: 'You shall swear that well and truly you shall serve the Queen our sovereign lady, and her people, in the office of Chancellor or Under Treasurer. And you shall do right to all manner of people, poor and rich, of such things as toucheth your office. And the Queen's treasure truly you shall keep and dispend. And truly you shall counsel the Queen, and her counsel you shall lain and keep. And that you shall neither know nor suffer the Queen's hurt, nor her disheriting. Nor that the rights of the crown be distressed by any means as far forth as you may let; and if you may not let it, you make knowledge thereof clearly and expressly to the Queen with your true advice and counsel. And you shall do and purchase the Queen's profit in all that you may reasonably do.—As GOD shall help you.' The third oath, taken as Chancellor of the Exchequer for Ireland, is worded rather differently, but has the same significance. For some occult reason, the Chancellor is obliged to take the oaths of allegiance twice; once at the Privy Council table, and once in the Court of Chancery. The oaths required from other officials are to the same tenor, being declarations of loyalty, honesty, secrecy, and impartiality, binding them to behave themselves as true and faithful servants ought to do. Sometimes they contain a special condition relating to their special duties. The Lord-lieutenant of

Digitized by Google

Ireland swears to keep her Majesty's peace amongst her people, maintain her officers and ministers in the execution and administration of justice, to defend her Majesty's castles, garrisons, dominions, and subjects, and to repress her rebels and enemies. The Lord Privy Seal undertakes to take especial care that the Privy Seal may be in such substantial wise used and safely kept, that no other person without the Queen's special commandment, or her assent and knowledge, shall move, seal, or imprint anything with the same. The Clerk of the House of Commons vows (spite of reporters) to keep secret all matters treated of in parliament, and 'not to disclose the same before they shall be published but to such as it ought to be disclosed to.'

Officers and servants of the royal household swear, among other things, not to depart out of her Majesty's service without reasonable warning, nor out of the court for any long term without licence. The members of the Honourable Corps of Gentlemen-at-arms are under more onerous obligations, if they are ever expected to keep their oath to the letter: 'You shall keep continually three double horses and two men, and provide that yourself and two servants may be also well furnished with harness to serve her Majesty in time of need, or otherwise for her Majesty's pleasure, at the command or appointment of your captain, his lieutenant, standard-bearer, &c., when commanded so to do by her Majesty. . . . When commanded by her Majesty, you shall also make your musters in such harness and other habiliments of war, and upon such horses as shall be your own proper goods, and no other man's. Also you shall not muster at any time hereafter before her Majesty, the captain, or other officers, with any man's servants in lieu of such servants as you be charged to keep, but only with such as shall be retained by yourself to serve the Queen's Majesty for the same intent and purpose.' A Yeoman of the Guard is sworn never to go above twenty miles from the court without a licence from the captain, adjutant, or clerk of the Cheque, and to keep the peace within the precincts of the court and in all other places as much as in him lieth, and cause everybody else to do the same.

As befits the representative of a long line of civic magistrates, the Lord Mayor of London takes the ancient oath of his office, although he thereby promises more than he intends to perform, and this is the oath to which he subscribes: 'Ye shall sweare that ye shall well and lawfully serue the Queen's Maiesty in the citty of London. And the same citty ye shall surely and safely keepe to the behoofe of her Highnes, her heires, and lawfull successors. And the profit of the Queen ye shall doe in all things that to you belongeth. And the right of the Queen that to the crown appertayneth in the same citty of London, lawfully ye shall keepe. Ye shall not consent to the decrease ne concealement of the rights, ne of the fraunchises of the Queen. And wheresoever ye shall knowe the rights of the Queen or of the crowne (be it in lands or in rents, fraunchises or sertes) concealed or withdrawen, to your power ye shall doe to repeale it. And if ye may not, ye shall say it to the Queen, or to them of counsell that ye wete will say it to the Queen. Also lawfully and rightfully ye shall entreate the people of your balliewick, and right shall ye doe to every one, as well to strangers as others, to poore as to riche, in that belongeth you to doe. And that for highnes ne for ryches, for gyfte, ne for beheste, for favour, ne for hate, wrong shall ye doe to no man. Ne nothing shall ye take by the which the Queen should leese, or right be disturbed or letted. And good assize shall ye sett upon breade, wyne, ale, flysh, fflesh, corne, and all other victuals. Weights and measures in the same citty ye shall doe to be kept, and due execution doe upon the defaults that thereof shall be founde according to all the statuts thereof made not repealed. And in all other things that to a mayor of the citty of London belongeth to doe and behaue you.—As God you helpe.' Aldermen cannot by virtue of their oath sell any kind of victual by retail, either in their own persons, or by means of their apprentices and servants; while they are bound to maintain the rights of orphans after the laws and usages of the city. A common-councillor swears not to maintain any singular profit against the common profit of the city of London, and not to leave the council until it be ended, without obtaining leave from the lord mayor.

The oaths taken by the heads of the many municipal corporations are but variations of one tune; enjoining loyalty to the throne, due administration of the laws, and resistance to all encroachments upon the rights, customs, and privileges of the places and people over which they hold their limited rule. But in one or two cases, we find something additional required, as at Montgomery, where the bailiffs promise to keep and defend the town and borough by day as well as by night; at King's Lynn, where the mayor undertakes to exercise the office of Clerk of the Markets, in setting the prices of victuals, reforming unlawful measures, and punishing victuallers; and at Wilton, where the same functionary promises to see that the borough be plenteously victualled; that the assize of bread, ale, wine, fish, flesh, coal, and candle be strictly observed; that all sellers of unwholesome food, regraters, forestallers, and misdoers against the common profit be openly punished; and finally, that the rents and goods of the burgesses and commonalty be employed to the benefit of the borough. In some towns, rather curious engagements are entered into by the burgesses. Those of Bristol solemnly promise not to 'colour the goods of any foreigner or stranger, or know any foreigner or stranger to buy and sell with another foreigner' within the precincts of the city, without informing the town-clerk thereof without delay; not to take any apprentice that is bond of blood, and no other except he be born under the Queen's 'obeysance;' and not to wear the livery of any lord, gentleman, or other person, but only the livery of his craft, or of the sheriff, lord high-steward, or mayor. A similar jealousy of strangers is found at East Looe and Liverpool—a burgess of the first swearing not to bear out any foreigner or stranger against the interests, rights, dues, and privileges of the corporation; while the Liverpudlian vows he will 'by no covin, colour, or deceit, free any foreigner, or the goods, chattels, or merchandise of any foreigner or non-freeman, in the name of his own proper goods, to the impairing of the customs of the town. Your Christchurch burgess takes oath not to carry away any muniment, escript, or scroll out of the common hall, or common coffer, without the consent of the mayor and a majority of the burgesses. A freeman of Coventry must promise not to allow any horse, mare, gelding, colt, filly, cow, heifer, or other cattle, belonging to another man, upon any

Digitized by Google

of the city's commons; and every burgess of Great Grimsby swears he will not, 'by reason of any lordship or mastership, nor other means, draw any manner of man to make any party against the mayor, or other burgesses or commoners of the borough, to reprove or hurt them, or bring any heaviness upon them,' upon pain of forfeiting his freedom.

A market-juryman of Boston binds himself to break, burn, or otherwise destroy all false weights and measures found within the borough, and bring up the users thereof for punishment, in company with regraters, forestallers, engrossers of provision, and sellers of unwholesome articles of food. Discreets of the market of Southampton swear to be indifferent betwixt buyer and seller, and to see that only good victuals, wholesome for man's body, be offered for sale; while the ale-taster of Wilton promises to look after the brewers and ale-house keepers, and see they brew good and wholesome beer, and sell the same according to the statutes of the realm. The good folks of Lincoln are particular in statistical matters, their foreman of the corn-jury having to swear that he will diligently inquire into, and give a true verdict as to the average prices of the wheat and grain sold in the Lincoln market. They rejoice, too, in the possession of officials seemingly peculiar to themselves, called 'searchers and sealers of and for tanners and butchers;' but what these officers search for, and what they seal, is a mystery we care not to try to fathom. So fond are municipalities of binding all their servitors by oaths, that even Bumble himself does not escape the infliction. The beadle of Wilton has to swear that he will duly and faithfully take up all swine pigs he may see going up and down in the borough, either at fair-time, market-time, or any other time, and detain the offending porkers until their owners have paid certain fines for their pigs' wrong-doings.

Police oaths are much the same everywhere; but the constables of Bishop's Castle vow not only to apprehend all rogues, vagabonds, wandering and idle persons, sturdy beggars, and suspected persons, and see they are corporally punished, but also to take care that the stocks and whipping-stock be kept in good order, and always ready for use. The constable of Wells curtly swears true constable to be, and true presentment make of bloodshedding, outcries, assaults, affraies, rescous made, and arrests broken within his jurisdiction. Members of the Metropolitan Police force swear, well and truly, and to the best of their knowledge and ability, to act as constables for the Metropolitan Police District, and within the palaces of Her Majesty Queen Victoria, and ten miles thereof, for preserving the peace and preventing robberies and other felonies, and apprehending offenders against the peace. The Royal Irish Constabulary and the Dublin police have furthermore to swear they will not belong to any political or secret society except the society of Freemasons.

The oaths of ecclesiastical officials are not without their curiosities. The deputy-registrar of York swears he will not render himself difficult, nor be a burdensome exacter of unjust fees; while the proctor of that Diocesan Court promises that, if in any part of a suit he becomes aware that his clients prosecute or defend an evil, unjust cause, which to him shall appear desperate, he will no longer delay such cause by any allegations or other frivolous and unjust means. The lay-officers of Hereford Cathedral swear not to tell anything abroad likely to turn to the hurt or damage of the church, college, or hospitals, and not to consent to the making of any leases, but according to the sense and meaning of the statutes and laudable customs of the cathedral church, to which they owe obedience.

Masters, wardens, assistants, freemen, clerks, beadles, in short all connected with the trade-guilds of London, have to subscribe to wordy oaths, requiring them to promote the interests and keep the counsel of the fellowships to which they belong, to behave modestly, soberly, gravely, and orderly in their assemblies, but speak their minds, sparing no man for favour, and grieving none for hatred. The different oaths have a strong family resemblance to each other, the only ones at all remarkable being the three we append. The oath taken by a freeman of the Goldsmiths' Company runs thus: 'You shall swear that you shall be faithful and true to our sovereign lady the Queen Victoria, and true gold and silver without deceit you shall work, and do to be wrought, so that the gold and silver that you work, or cause to be wrought, be as good as one of the standards appointed for wrought-plate; and you shall set no glasses nor counterfeit stones in gold, nor work latten nor copper, whereby the Queen's people might be deceived; nor no deceit known to be done in anything that belongeth to the craft of goldsmiths, but that you anon warn the wardens, for the amendments of the same, and all the good ordinances of the same craft you shall keep;' &c. The searcher of the Founders' Company subscribes to the following: 'You shall swear that from time to time, at the appointment and commandment of the master and wardens, or otherwise when you shall see just occasion, you shall make diligent view and search within the city of London and suburbs, and three miles' compass thereof, as well for all manner of deceitful works wrought into brass or copper wares, as for deceitful brass weights of all kinds, and do your best endeavour that the makers, sellers, and workers of the same deceitful works and weights be justly and condignly punished and corrected. And all such as you shall find to be true, sufficient, and lawful brass weights, agreeable to the Queen's Majesty's standards, you shall do your best to cause them to be seized and marked with the common, usual, and accustomed mark of the said mystery or company, being the stamp and form of an ewer.' A Hostler of the Innholders' Company has to bind himself to the performance of still more troublesome duties: 'You shall bee true and faithfull to our Soveraigne Lord the Kinge that now is, and to his heires and successors, kinges and queenes of England. You shall bee obedient lawfully to the wardens and masters of this societie for the time beinge in all such thinges as concern the good government of the said societie. And if your master, with whom you serve, use any subtiltie or crafty demeanure in his weights, hostries, measures, or lodgeings, or double hostries, contrary to the orders of this societie, you shall, at the request of the master and wardens of this societie, utter and shew the same to them. And, moreover, if you have knowledge and intelligence of any felons, murtherers, or other suspicious persons resortinge to your master's house, or the houses of any other of the said societie, you shall, with all diligence, disclose and shew the same unto your owne master, or else unto the master and wardens of the societie

Digitized by Google

of Innholders for the time beinge. You shall not wittingly or willingly receive, harbour, or cherish any thiefe, robber, or other suspicious persons. You shall not bee of councell with any thiefe, robber, or other persons for the settinge of any robbery, or doeinge of any violence, thefte, or fraud to any person, nor shall know the like intended by any without discloseinge the same, either to your owne master with whom you serve, or to the master and wardens for the time beinge of Innholders, to the intent it may bee discovered to some magistrate.'

How parliament will deal with the oath-question remains to be seen. The Royal Commissioners are agreed upon the desirability of sweeping away the great mass of oaths taken upon admission to offices; but while some of them would abolish them altogether, others would substitute declarations in their place. We certainly think there is much force in the remark of Mr Tyler, that no man should be called upon to promise to do what he is bound by the duties of his office to perform, the very act of accepting office being a promise to perform its duties; and most people will agree with Lord Lyveden, the late Dean Milman, and Messrs Maxwell, Bouverie, and Lowe, that no declaration or promissory obligation should be imposed by the legislature without penalties attaching to its non-observance which public opinion will approve, and the executive enforce. 'If the penalty be incurred and not exacted in any single case, the force, not only of the violated obligation, but of all similar obligations, is sensibly diminished; and even if the public conscience be at first shocked by the unpunished crime, it will soon become reconciled to the impunity, and ere long may even be disposed to condemn the infliction of the punishment.' This is true enough; and equally true are the concluding sentences of the paper bearing the signatures of the above-named gentlemen: 'When a declaration has lapsed into a mere form, and, as a general rule, is made falsely with impunity, it has obviously not only ceased to be useful, but has become mischievous, and it is for the public advantage that the scandal should be removed as speedily as possible.'

A PERFECT TREASURE.

CHAPTER V.—I AM EDITED.

DIRECTLY after my interview with my uncle, I was off for Sandiford, borne, as it were, on the wings of my glad news. How easily elated I was in those days! How ridiculously prompt to believe that others were as interested in my affairs as I was myself! How inordinately egotistic, how credulous, how vain! But then, as dear Mrs Blunt had observed, what lungs I had, what limbs!

The snow was falling thickly that December day, but I flew through it like a bird.

> Like those trim skiffs, unknown of yore
> On winding lake or river wide,
> That need no aid of sail or oar,
> That heed no spite of wind and tide,
> Nought cared this body for wind nor weather,
> When Youth and I lived in 't together;

and yet I would have given up all that vigour for ever so small a modicum of Fame, all that brave sack (of which I know the true value now) for a poor halfpennyworth of mouldy bread. I remember how disgusted I was that what I had to tell did not seem to fill good Mrs Blunt with sympathetic transport. It did not even surprise her in the least.

'I knew you would persuade that dear Maharajah to let you do as you liked, Marmy. If I had said that your manuscripts were only good for lighting the fires, you would have still got your way. However, I have done my duty. I am like the master of the ship who has been consulted by the captain as to its course, and has replied, that it is, in his opinion, a dangerous one—full of rocks and shoals; notwithstanding which the captain decides to hold on. I have made my remonstrance; if any mischance happens, I at least am not to blame.'

'Certainly not, madam,' answered I; 'but, like a good sailor who loves his ship' ('You rogue!' interrupted Mrs Eleanor Blunt), 'you will do your best to save her, nevertheless.'

The good-natured old lady was charmed with this reply. 'Well, my dear,' said she, 'I will do my best; but indeed literature is a trade in which a man must make his own way: an introduction from another is but of little service. You may get your head in that way, but your shoulders must follow by your own exertions. It is no use my pushing you from behind.—Now, you want me to get some of these deathless works of yours into print, I suppose?'—and here she touched the parcel of manuscripts a little contemptuously.

'Yes, madam.'

'That would be to do you a very ill service, Marmy,' said she gravely. 'At sixteen, everybody writes rubbish; Shakspeare himself doubtless did so at that epoch, and occasionally even a little later. I do not deny that this stuff is creditable to a lad like you, whose writing anything is like a dog walking on his hind-legs, as Johnson says; you do not do it well, but the wonder is that you do it at all. But then the wonder is only excited in those who are acquainted with your circumstances—your tender years. If the public should read these things in print as productions of a grown-up writer, they would only say: "This is a wretched plagiarist;" and they would be right.—Now, don't be cast down, my dear; you will have much worse things said of you in after-years, if you take up with this calling, by persons who have not (as I have) your good in view, but only the indulgence of their own spite. Gad, sir, with a skin like yours, you will be stung to death by midges.'

I certainly felt very sore already, but not at all in the sense of irritation; I was utterly depressed and humiliated. I felt that Mrs Blunt was speaking the truth—that all those precious papers, the results of months of delightful toil, were indeed nothing but 'wretched plagiarisms;' the poems were echoes; the prose, a patchwork, made up of scraps from my favourite authors.

'I will throw all these things behind the fire, said I suddenly; and I rose to do so.

'You will do nothing of the sort, my dear,' said the old lady quietly: 'first, because so much fuel

Digitized by Google

would certainly set fire to my little chimney; and secondly, because what is valuable about your works will not remain after such a crucial test, as gold does in the furnace. I told you in my letter that it was not all rubbish. When I was your age, I had written twice as much, and what was equally worthless as a whole; but, as in your case, there was the seed of good in them, the raw material that only required the requisite machinery—experience of life, power of expression, and other matters which cannot be supplied by intuition—to turn it (to use a woman's image) into a fabric of pretty pattern, warranted to wash and wear. I laid by all these productions, not in obedience to the Horatian maxim, but simply because I could get nobody to publish them; and in after-years, while fully agreeing with the adverse editorial verdicts that had kept them in manuscript, I found in almost all of them the germ of something that blossomed agreeably enough in print. Indeed, I think the best things I have done are those which occurred to me in embryo, when I was very young. Some excellent compositions have doubtless been written off-hand by great authors in heat and at a sitting; but, generally speaking—and especially with respect to prose writings—what is best is that which has long ripened in the brain, and been afterwards carefully pruned and trimmed. Thanks to the cant of our calling, this is not the popular view of good authorship; but believe me, Marmy, it is the true one; and whenever a professional writer tells you that he "trusts to inspiration," you may depend upon it that he takes a good deal of brandy and water.'

'But these manuscripts,' said I, impatient of Mrs Blunt's abstract remarks, and ignorant of their practical importance: 'how am I to know what is wheat-ear and what is chaff?'

'In a year or two, you will be able to judge for yourself, Marmy; but at present this is perhaps the one thing in which I can be of service to you. I will be your editor this afternoon; only, instead of the usual "Declined with thanks," I will give you my reasons for rejection.'

'How kind you are!' cried I, with genuine gratitude, for, though careless of advice in the general as any other young gentleman, I knew how to estimate it in this case. 'How can I ever repay you, dear Mrs Blunt?'

'What! for being your editor? Well, perhaps you may be my biographer some day, Marmy, when you will deal tenderly with my memory, for this day's sake.'

I don't know what I answered; but the old lady nodded pleasantly in reply, and said: 'God bless you, my dear.'

Then we set to work at those manuscripts. I am afraid to say how many there were; but Mrs Blunt read more than a dozen of them aloud. Her elocution was much better than mine, and yet they did not sound to me nearly so well as when I had read them to myself. It was often necessary for her to stop at this or that flowery passage (which had formerly seemed such a gem), with some remark, such as: 'Too many creepers for your trellis-work, Marmy;' or, 'Too fine, my dear, by half—all sunflowers and crown imperials.' I could see for myself now how garish and tawdry the language was. The misplaced or extravagant epithets, the lavish synonyms, the borrowed images, were all pointed out with an unerring finger; and the bathos of many a splendid peroration was so laid bare, that I almost laughed at it myself. Nor did she confine herself to verbal criticism, but, with a nicety which shewed what pains she had taken with my poor productions, explained how the interest of one narrative was weakened by division, or exhibited the inconsistences of character in the *dramatis personæ* of another. She used the scalpel like a skilful surgeon, fearlessly, but not mercilessly; she cut deep, but without inflicting unnecessary pain. And, on the other hand, with what pleasure she halted whenever in that Great Sahara she found palms and water, to say: 'Well done;' or, 'That's really good, Marmy.'

Of course, in my case there was a little favouritism; but in the matter of generous yet critical appreciation, I have never known any one (save dear Leigh Hunt, perhaps) to equal Mrs Eleanor Blunt! She was a very Jack Horner for picking out literary plums. It is true these were very scarce in my pudding; but the praise, when it did come, was all the more precious; the balm in those few words healed all the gaping wounds which had been before inflicted on my self-love, and left me all the better for the blood-letting; or I should rather say I felt in my new literary position like one who has been just shampooed in a Turkish bath—much less corporeally, but with what was left of me in the highest possible condition. Before the operation, I had no idea that there had been so much superfluity to come away; but now I trod upon air. In only one respect was I cast down; my poetry had met with considerably less favour in my mentor's eyes than my prose. It was not without some grace and elegance of expression, she allowed, but 'Gad, sir, it's very thin.' She was strongly against my cultivating this talent. 'If you were a rich man, Marmy, it would be different; you might give half your days to polish—*ad unguem*, &c., you know' (but I didn't know); 'as it is, you cannot afford the time. The chances are ten thousand to one, and more, against your getting your living by such work. The British public can only afford to keep one or two poets at most; the rest find the greatest difficulty in keeping themselves. It is the prose that pays, and, above all, that branch of it to which you seem to have some calling. Some day, when you and I are dead, Marmy, and all the world runs and reads, and Yankee publishers give up thieving, the most popular British novelist will be the richest man in England. In the meantime, half a loaf, or less, is better than no bread, and we pick up our crumbs. But the writer of fiction needs, above all others, to have experience of life. You cannot spin stories out of your inside, as a spider spins his web; you must have material. You must study men and women, Marmy, as the scholar his books. The volume of Nature is open to you at Hershell Point; but there are not enough of those flesh-and-blood illustrations which you require to have before your eyes. When you have painted your uncle (whose outlines are recognisable enough in your productions already), and that black gentleman who waits upon him, and little Mr Glendell, your doctor (a very excellent fellow, by the by), and me, you will almost have come to the end of your present tether. You must not stop at "the Point," Marmy, if you mean to take up the trade of letters.'

'I could never leave my uncle,' said I firmly.

'Then you must take him away with you,'

Digitized by Google

replied Mrs Blunt. 'But you need not think of that for some time to come. For the present, read whatever you can lay hands on, but especially good sterling English writers like this man' (she put into my hands the *Rural Rides* of William Cobbett): 'the descriptions in that book excel all your modern word-paintings for life-likeness, as much as objects in a stereoscope excel those in a picture. Read, and, above all things, observe; and never trust to your memory when there is an opportunity to use a note-book.—There, Marmy; my preaching is over. The words of the wisdom of Mrs Eleanor Blunt are ended.'

'They will not soon be forgotten, dear madam,' said I dutifully.

'I hope not, my dear; and I will now add, for your encouragement—since it is finally settled that you are to try to open that oyster "the world" with a steel pen—that it is my belief that you will succeed in doing so. If the ex-maharajah can, as he says, support you for five years, you ought certainly by that time to be able to run alone. For even if one fails as an author,' squeaked the dear old lady, her black eyes dancing with roguish glee, 'and the worst comes to the very worst, one can always be a critic, you know, Marmy.'

I do not think there was any happier creature on the earth than I as I ran home that evening, after a *tête-à-tête* dinner with my hostess. The snow had ceased, leaving the whole earth covered with a mantle, on which the moonbeams sparkled as on frosted silver. The sky shewed a thousand stars. The winter sea sent its deep monotone for miles inland through the clear still air. I seemed to drink in the beauty of earth and air, and sky and sea, as I had never done before. It was a keen and bitter frost, but my veins were aglow with a joy that no cold could chill. I have said that there was no light-house at that time at Hershell; but to one coming from Sandiford, the lamp in our sitting-room could always be seen at night from a great distance. I wondered that I did not see it there now; but concluding that my uncle had retired earlier than usual, its absence gave me no anxiety. When I reached home, however, and Martha answered the bell, I saw by her face at once that something was amiss.

'What is the matter?' asked I with anxiety. 'My uncle is not in the sitting-room.'

'No, sir, nor in the house neither,' answered the cook. 'He 's gone away, and Heaven knows where, all along of that Sugary Tannajee; drat him!'

CHAPTER VI.—THE HINDU BECOMES MY PATIENT.

My uncle's absence was unprecedented. Ever since I had known him, he had never left 'the Point,' [even for a single day; but the sudden departure (for such I learned it had been) of Sangaree Tannajee was even more extraordinary still. He had no friend in the world except his master; his colour, his strange English, and—if I might so speak of the absent—his extravagantly hideous appearance, made him an object of ridicule to all except our little household. Our roof was the only secure haven for him, and yet he had left it of his own free-will, and apparently for good and all. At least—as Martha informed me—he had quitted the house while my uncle and I were engaged in that conversation concerning my future which has been already described, with a large white bundle, that was his substitute for portmanteau, hat-box, &c., and which doubtless contained all his worldly goods, since they were missing. His absence was not remarked until I had myself left for Sandiford, when my uncle had rung his bell for him in vain. 'Then such a fuss as there was, Mr Marmaduke. I never saw master so put about before,' said Martha, describing these occurrences with great unction. 'It was: "Cook, run here," and "Nancy, run there"—all after that liver-coloured Tannajee. Your uncle ran down to the beach as lissome as yourself, as though he expected to find his man had toppled hisself over the cliff. But, as I said to Nancy, he was a deal more likely, was Sugary, to kill somebody else than his precious self; and master heard me, and oh, Mr Marmaduke, if he didn't swear worse than the parrot! I never heard the likes; for Tannajee, with all the will in the world to be wicked, could never swear like a Christian man. "Well," says I, "these are pretty words; and if I leave your service to-morrow, sir, I hope that 'ere fellow has gone for good, as the saying is (though for good he never can be); for a sweet riddance it will be for them as he 's left behind."—"I beg your pardon, Martha, for swearing," says your uncle, as gentle as could be; "but you don't know what you are talking about." And he really did look so grieved, that I half-wished the poor coloured creature back again, if that could be any comfort to him, as a black dose is said to be to them as is bilious, which I never was myself, and consequently don't hold by it. Well, we searched and searched, but he was nowhere to be found; and presently the baker came, and said he had met my gentleman with a bundle on his shoulder, making straight for Daisyport. At which news your uncle snatched up his hat, and without even putting his greatcoat on, started off like a March hare. And that 's just all I knows about it, Mr Marmaduke.'

This news distressed me exceedingly; not, of course, that I regretted the Hindu's defection one whit more than did his fellow-servants, upon its own account, but for the vexation it had evidently caused his master; while I could not divest myself of the idea that it was my own behaviour towards the missing man that had somehow brought about the catastrophe. When I called to mind the expression of truculent animosity which Tannajee's face had worn that morning, when I stirred his fat carcass with my foot, and his vehemence of speech and gesture when my uncle strode in between us, I could not but acknowledge that it must be me who was to blame; and for how much? What was the extent of the mischief to my kind protector? What stake could my uncle have in this man? What interest in keeping him in his service, that he should thus start off in cold and darkness to pursue him? I did not for a moment believe that mere attachment to Tannajee had caused this solicitude for his safety. It is true that master and man were on those terms of familiarity that are sometimes seen between an employer and his faithful dependant; but this did not seem to me to be founded on the usual base of tried and ancient service. I had penetration enough to see through the Hindu's show of respect to my uncle in public, and to contrast it with his languid insolence when I had occasionally, and on that very morning, come upon them when alone. My presence had hitherto, as it seemed to me, been the signal for both to return to something like their respective positions, to act the parts of master

Digitized by Google

and servant, which were laid aside when there was no spectator; and yet, I repeat, it did not strike me that Uncle Theo had much genuine regard for Tannajee, and far less that the latter had a due respect for his employer. The bond of union, evidently so strong between them, was not that of mutual esteem or affection. What, then, in the name of wonder, could it be? What material interest could they possibly have in common? My uncle had spoken of our not discovering the true value of the Asiatic until his death—a common expression enough, it is true, to apply to a well-tried and valuable domestic, but which was, in this man's case, a most inappropriate phrase. Sangaree Tannajee was an ill-tempered idle fellow, quarrelsome in his cups, and very often in them, one who gave more trouble to our little household than any other member of it, and whose situation in it grew more and more of a sinecure daily. Was it possible, then, that my uncle literally meant that his death would be of pecuniary advantage to us? What had this wretched Hindu to leave behind him, except his turban and a few yards of spotless linen? Besides, it could not be the loss of him to which my guardian had thus alluded, for had he not once observed to me: 'I would not lose Sangaree Tannajee for ten thousand pounds.'

Sorely perplexed by these reflections, I sat up in our little drawing-room, vainly endeavouring to give my attention to anything else. I tried to write, but found my fingers involuntarily forming the mysterious Asiatic's name; I took up book after book, and the printed letters formed themselves into the same combination again and again; I went to the window, in hopes to see my uncle and his man—for without the latter I felt confident the former would not return—descending the zigzag; but I saw nothing but 'the flying cloud, the frosty night.' It had grown darker since my arrival, and presently the dusk was such that, in order to pierce through it with my eyes at all, I was obliged to extinguish the lamp. The wind, too, had risen, and howled dismally about our little house. Then I feared for my uncle's health, who, although a strong man in other respects, had been made by the Indian climate peculiarly susceptible to cold. We had fires at Hershell Point a month before other folks in the neighbourhood began them, on the ex-maharajah's account, at least as much as by reason of our more exposed position. He scarcely ever ventured out even in the autumn evenings, yet now he had departed without a greatcoat across the snowy downs to Daisyport. And once more I bitterly reproached myself for having been the unwitting cause of such a dangerous imprudence.

I went down to the kitchen, and enjoined on Martha to have something warm and savoury in readiness, and boiling water for a hot bath if necessary; and I kept up the fire in my uncle's bedroom—the only luxury, by the by, except his cheroots, in which he ever indulged—with my own hands.

At last, about one in the morning, I discerned two figures slowly wending their way down the zigzag. It was in the highest degree improbable that they should be any others than those for whom I waited; yet even as they drew near I could scarcely recognise them. The brisk elastic tread of my dear uncle was exchanged for the stumbling gait of an overtired and exhausted man; the slouching amble which generally characterised Tannajee, who, notwithstanding his huge proportions, was a speedy walker after his own fashion, had altogether disappeared. He moved with slow and hesitating steps, like one who walks in his sleep; and short as the distance was during which I observed them, I saw him stop suddenly half-a-dozen times, and receive his master's assistance before he could proceed. I ran out to meet them, and my uncle smiled and nodded, but it really seemed that he had no strength to speak.

'Get Tannajee to bed,' he murmured: 'the doctor at once.'

Certainly the Hindu looked wretchedly ill. As Martha used (not without some satisfaction) to express it, he always enjoyed bad health: his digestion I knew was dreadfully impaired, and I attributed it to drink; but I had never seen him look half so bad as on the present occasion. In the first place, he rolled from side to side like a loose cask on shipboard, and had no command whatever over his limbs. His eyes, which had never, within my recollection, failed to express disfavour at my approach, had now no more speculation in them than those of a corpse; and in spite of the bitter cold, he was in a profuse perspiration.

It was absolutely necessary for me to remain to assist him up the steps before our door; a task to which his companion, unaided, seemed wholly unequal; but no sooner had we got him within-side, than my uncle reiterated: 'The doctor at once, Marmy;' and off I flew into the village. I was back again in ten minutes.—Mr Glendell, the kindly Æsculapius of the place, having promised to follow me as soon as he could—when a strange sight indeed was presented to me. My uncle, his wet clothes still unchanged—for snow had fallen during the last few hours upon the downland—was walking Tannajee about from room to room, in spite of the Hindu's entreaties to be suffered to lie down and sleep. The garments of the latter had been exchanged for warm and dry ones, and the solicitude for his welfare expressed in his master's eyes was like that of some devoted brother. It was with difficulty, and only under promise of keeping the unhappy Tannajee in active exercise, that I could persuade my uncle to take measures for his own safety. I did not stop to inquire why such a task was imposed upon me, but hustled my remonstrating charge from parlour to kitchen with a 'No, you don't,' and the application of a pin's point, whenever he attempted to take a chair. 'Don't let him stand still, Marmy,' was my uncle's earnest direction to me, 'or permit him to sit down for a single instant; his very life depends upon it, and,' added he in a solemn whisper, 'your uncle's honour.'

Of course I was careful to obey such instructions, however inexplicable they might appear; but I pitied poor helpless Sambo from my heart, notwithstanding that ever and anon his flabby features were overspread with a baleful glance at his tormentor, to whom he evidently gave no credit for any good intentions towards him.

It was clear he was dog-tired and, but for me, would have fallen asleep as he moved; but besides that, he seemed to be in that peculiar stage of intoxication which is called 'sodden;' his senses appeared to be so steeped in liquor that there was no rousing them; and I could not but wonder that he was not permitted to obey the dictates of nature, and sleep away the effects of so gross a debauch.

Digitized by Google

When the doctor came, however, and had exchanged a few words in private with my uncle, he quite approved of the very singular treatment to which the Hindu had been subjected, with the addition that cold water should be constantly dashed on his head, and directed that it should for the present be continued. 'The stomach-pump is what he *wants*,' said Mr Glendell thoughtfully.

'The very thing,' cried Uncle Theo with excitement; 'of course he wants the stomach-pump.'

'Yes; but unfortunately my little surgery does not boast of such an article,' returned the doctor; 'and I am afraid you, Mr Braydon, are not like Mr Alfred Jingle, who, you remember (in *Pickwick*), always carried that useful article in his portmanteau.'

My uncle sighed profoundly. 'No, indeed,' said he. The other's jocose allusion seemed to grate upon his feelings, moved as they were so powerfully by the spectacle before them.

'Don't be cast down, my good sir,' said Mr Glendell briskly; 'although your anxiety about our coloured friend here, I am sure does you infinite credit.' (Sambo's character as a domestic servant was not unknown to the speaker, who had also attended him professionally before.) 'It is my opinion that he has already tided over the worst of it. It is indeed entirely to your exertions that he owes his life; five minutes' sleep upon the downs yonder would have been his death-doom; but I do think you have pulled him through. If he had not been a confirmed opium-eater, such a dose would have killed him on the spot; but being so used to it—— There; he's opened his eyes quite wide, you see. I should have said "sulphate of zinc and powdered ipecacuanha," if I had seen him earlier; but it is too late for that sort of treatment now; and indeed he is too exhausted. He had a strong constitution originally, that fellow, but he has played the deuce with it. Opium and drink have undermined him, and I should fancy—at one time of his life at least—to judge by the look of him, overfeeding.'

'No; he has always been very temperate as to food,' replied my uncle.

'Ah, well, then he's been particularly unfortunate in what he did eat,' observed the surgeon drily, 'for he's a victim to dyspepsia. Perhaps that accounts for his queer temper.—Were you telling me that he actually took that laudanum, simply because you told him to come back with you from Daisyport?'

'He did indeed. I came up with him just before he reached the town, and insisted upon his return—upon his not leaving my house in that surreptitious and unpleasant manner. Then he flew into an outrageous passion, and declared all I wanted was his death.'

'The ungrateful nigger!' ejaculated the doctor.

'Well, I did not condescend to remonstrate with him; but seizing him firmly by the wrist, I compelled him to accompany me. He got very tired coming over the down, and presently we sat down to rest. Then he began to narrate his troubles; how badly he was treated at Hershell Point' (the doctor smiled contemptuously), 'and especially what indignities he had to put up with.'

Here I felt my cheeks burn, for I knew that my uncle was speaking as much for my own benefit as that of his other hearer.

'Do you feel better, Tannajee?' inquired I tenderly, as I administered another glass of water to his forehead, like a clergyman who baptizes a delicate babe.

He muttered something in the Hindustanee language in reply, which, being translated, means 'child of the devil.' It was his favourite term for me when he was in his cups.

'I don't think I have much to reproach myself with as Tannajee's master,' continued Uncle Theo gravely; 'and I told him so pretty plainly. Some high words passed between us. He jumped up, and attempted to run away from me, and I pursued and collared him—perhaps a little roughly. Then once more crying out that all I wanted was his death, and actuated by one of those childish fits of passion peculiar to his race, he produced a phial of laudanum from his pocket, and drank it to the dregs before I could stop his hand. Imagine my horror, Glendell, and the difficulties of my position! I am a powerful man; but to convoy, or rather to convey a person of his bulk for many miles, contrary to such will as was left in him, and against wind and snow, is no slight task. However, if I have indeed saved the poor fellow's life, I do not begrudge my labour.'

'You have behaved nobly, Mr Braydon, and I think have reaped your reward,' said the surgeon; 'although you will be lucky if you do not suffer in your own health from such exertions.—See; our patient is recovering his beautiful native colour under Mr Marmaduke's hands; and after some egg and milk, I think he may be suffered to have his sleep out.'

'He shall be put in my bed,' said my uncle; 'and Marmy and I will keep watch over him by turns.'

'I hope Mr Tannajee will be grateful for your kind attentions,' remarked the doctor severely; 'though he does not seem to have a very genial expression at present. But it is a good sign when a gentleman in his position begins to recover his usual looks. If he asks for anything to drink, which he is pretty sure to do, give him magnesia and water.' With that the surgeon took his leave; and my uncle and I led the already half-slumbering Hindu to his welcome pillow.

'I shall watch him for an hour or two, Marmy; and do you go to bed, my lad, for you must be sadly tired. If all seems to be going on well, I shall take my snooze on the sofa.'

In vain I endeavoured to combat this resolution.

'I have begun with this, Marmy,' said my uncle earnestly, 'and I will go through with it. Tired as I am, I should not sleep a wink while there was still cause for anxiety. I thank God that it has been in my power to do what I have done for this man. Yes; I am truly grateful for having been strengthened to do my duty. The devil has been sorely tempting me this night, Marmy, but he has not overcome me. I feel as though I had even taken a few steps towards heaven.' With a grave yet well-pleased look, my uncle Theo took both my hands in his, and kissed my cheek. 'Good-night, dear lad, and remember me in your prayers.'

Astonished as I was by my uncle's manner as much as by his words, I felt that it was no time to ask for explanations, but retired to my bed at once. I was awakened in about an hour's time by the sound of high words in my uncle's room. The patient and the watcher were quarrelling. They spoke as usual in the Hindustanee tongue, but I caught one word repeated by my uncle with extreme vehemence, with sufficient accuracy to remember it.

The application of the term seemed instantly to silence Sangaree Tannajee, and I laid it carefully up in my mind for future use, should occasion arise for it on my own account.

SQUARING THE CIRCLE.

THERE must be a singular charm about insoluble problems, since there are never wanting persons who are willing to attack them. We doubt not that at this moment there are persons who are devoting their energies to Squaring the Circle, in the full belief that important advantages would accrue to science—and possibly a considerable pecuniary profit to themselves—if they could succeed in solving it. Quite recently, applications have been made to the Paris Academy of Sciences, to ascertain what was the amount which that body was authorised to pay over to any one who should square the circle. So seriously, indeed, was the secretary annoyed by applications of this sort, that it was found necessary to announce in the daily journals that the Academy was not only unauthorised to pay any sum at all, but that it had determined never to give the least attention to those who fancied they had mastered the famous problem.

It is a singular circumstance, that people have even attacked the problem without knowing exactly what its nature is. One ingenious workman, to whom the difficulty had been propounded, actually set to work to invent an arrangement for measuring the circumference of the circle; and was perfectly satisfied that he had thus solved a problem which had mastered all the mathematicians of ancient and modern times. That we may not fall into a similar error, let us clearly understand what it is that is required for the solution of the problem of 'squaring the circle.'

To begin with, we must note that the term 'squaring the circle' is rather a misnomer; because the true problem to be solved is the determination of the length of a circle's circumference when the diameter is known. Of course, the solution of this problem, or, as it is termed, the *rectification* of the circle, involves the solution of the other, or the *quadrature* of the circle. But it is well to keep the simpler issue before us.

Many have supposed that there exists some exact relation between the circumference and the diameter of the circle, and that the problem to be solved is the determination of this relation. Suppose, for example, that the approximate relation discovered by Archimedes (who found, that if a circle's diameter is represented by *seven*, the circumference may be almost exactly represented by *twenty-two*) were strictly correct, and that Archimedes had proved it to be so: then, according to this view, he would have solved the great problem; and it is to determine a relation of some such sort that many persons have set themselves. Now, undoubtedly, if any relation of this sort could be established, the problem would be solved; but, as a matter of fact, no such relation exists, and the solution of the problem does not require that there should be any relation of the sort. For example, we do not look on the determination of the diagonal of a square (whose side is known) as an insoluble, or as otherwise than a very simple problem. Yet, in this case, no exact relation exists. We cannot possibly express both the side and the diagonal of a square in whole numbers, no matter what unit of measurement we adopt: or, to put the matter in another way, we cannot possibly divide both the side and the diagonal into equal parts (which shall be the same along each), no matter how small we take the parts. If we divide the side into 1000 parts, there will be 1414 such parts, *and a piece over*, in the diagonal; if we divide the side into 10,000 parts, there will be 14,142, and still a little piece over, in the diagonal; and so on for ever. Similarly, the mere fact that no exact relation exists between the diameter and the circumference of a circle, is no bar whatever to the solution of the great problem.

Before leaving this part of the subject, however, we may mention a relation which is very easily remembered, and is very nearly exact—much more so, at any rate, than that of Archimedes. Write down the numbers 113355, that is, the first three odd numbers each repeated twice over. Then separate the six numbers into two sets of three, thus: 113) 355, and proceed with the division thus indicated. The result, 3·1415929 . . . . , expresses the circumference of a circle whose diameter is 1, correctly to the sixth decimal place, the true relation being 3·14159265 . . . .

Again, many people imagine that mathematicians are still in a state of uncertainty as to the relation which exists between the circumference and the diameter of a circle. If this were so, scientific societies might well hold out a reward to any one who could enlighten them; for the determination of this relation (with satisfactory exactitude) may be held to lie at the foundation of the whole of our modern system of mathematics. We need hardly say that no doubt whatever rests on the matter. A hundred different methods are known to mathematicians by which the circumference may be calculated from the diameter with any required degree of exactness. Here is a simple one, for example: Take any number of the fractions formed by putting *one* as a numerator over the successive odd numbers. Add together the alternate ones beginning with the first, which, of course, is unity. Add together the remainder. Subtract the second sum from the first. The remainder will express the circumference (the diameter being taken as unity) to any required degree of exactness. We have merely to take enough fractions. The process would, of course, be a very laborious one, if great exactness were required, and, as a matter of fact, mathematicians have made use of much more convenient ones in determining the required relation; but the method is strictly exact.

The largest circle we have much to do with in scientific questions, is the earth's equator. As a matter of curiosity, we may inquire what the circumference of the earth's orbit is; but as we are far from being sure of the exact length of the radius of that orbit (that is, of the earth's distance from the sun), it is clear that we do not need a very exact relation between the circumference and the diameter in dealing with that enormous circle. Confining ourselves, therefore, to the circle of the earth's equator, let us see what exactness we seem to require. We will suppose for a moment that it is possible to measure round the earth's equator without losing count of a single yard, and that we want to gather from our estimate what the diameter of this great circle may be. This seems, indeed, the only use to which, in this case, we can put our knowledge of the relation we are dealing

Digitized by Google

with. We have then a circle some twenty-five thousand miles round, and each mile contains one thousand seven hundred and sixty yards; or, in all, there are some forty-four million yards in the circumference, and therefore (roughly) some fourteen million yards in the diameter of this great circle. Hence, if our relation is correct within a fourteen-millionth part of the diameter, or a forty-four-millionth part of the circumference, we are safe from any error exceeding a yard. All we want, then, is that the number expressing the circumference (the diameter being unity) should be true to the eighth decimal place, as quoted above.

But, as we have said, mathematicians have not been content with a computation of this sort. They have calculated the number not to the *eighth*, but to the *four hundred and fortieth* decimal place. Now, if we remember that each new decimal makes the result ten times more exact, we shall begin to see what a waste of time there has been in this tremendous calculation. We all remember the story of the horse which had twenty-four nails in its shoes, and was valued at the sum obtained by adding together a farthing for the first nail, a halfpenny for the next, a penny for the next, and so on; doubling twenty-four times. The result was counted by thousands of pounds. Even the old miser who paid at a similar rate for a grave eighteen feet deep (doubling for each foot), killed himself when he heard the total. But now consider the effect of multiplying by ten, four hundred and forty-eight times. A fraction, with that enormous number for denominator, and unity for numerator, expresses the minuteness of the error which would result if the 'long value' of the circumference were made use of. Let an illustration present the meaning of this:

It has been estimated that light, which could eight times circle the earth in a second, takes fifty thousand years in flying to us from the faintest stars seen in Lord Rosse's giant reflector. Suppose we knew the exact length of the tremendous line which extends from the earth to such a star, and wanted, for some inconceivable purpose, to know the length of the circumference of a circle of which that line was the radius. The value deduced from the above-mentioned calculation of the relation between the circumference and the diameter, would differ from the truth by a length which would be imperceptible under the most powerful microscope ever yet constructed. Nay, the radius we have conceived, enormous as it is, might be increased a million-fold, or a million times a million-fold, with the same result. And the area of the circle formed with this increased radius, would be determinable with so much accuracy, that the error, if presented in the form of a minute square, would be utterly imperceptible under a microscope a million times more powerful than the best ever yet constructed by man.

Not only has the length of the circumference been calculated once in this unnecessarily exact manner, but a second calculator has gone over the work independently. The two results, identical figure for figure, are presented in *The Lady's and Gentleman's Diary* for 1854, page 70; and for 1855, page 86.

It will be asked then, what *is* the problem about which so great a work has been made? The problem is, in fact, utterly insignificant; its only interest lies in the fact that it is insoluble—a property which it shares along with many other problems, as the trisection of an angle, the duplication of a cube, and so on.

The problem is simply this: *Having given the diameter of a circle, to determine, by a geometrical construction, in which only straight lines and circles shall be made use of, the side of a square equal in area to the circle.* As we have said, the problem is solved, if, by a construction of the kind described, we can determine the length of the circumference, because, then the rectangle under half this length and the radius is equal in area to the circle, and it is a simple problem to describe a square equal to a given rectangle.

To illustrate the kind of construction required, we give an approximate solution which is remarkably simple, and, so far as we know, not generally known. In the given circle draw two diameters, AOB, COD, at right angles to each other, and join CA, BD: then the two diameters together with the two lines CA and BD are very nearly equal to the circumference of the circle. The difference is so small, that in a circle two feet in diameter, it would be less than the two-hundredth part of an inch. If this construction were exact, the great problem would have been solved.

One point, however, must be noted; the circle is of all curved lines the easiest to draw by mechanical means. But there are others which can be so drawn. And, if such curves as these be admitted as available, the problem of the quadrature of the circle can be readily solved. There is a curve, for instance, invented by Dinostratus which can readily be described mechanically, and has been called the quadratrix of Dinostratus, because it has the property of thus solving the problem we are dealing with.

As such curves can be described with quite as much accuracy as the circle—for, be it remembered, an absolutely perfect circle has never yet been drawn—we see that it is only the limitations which geometers have themselves invented that give this problem its difficulty. It has, as we have said, no value; and no mathematician would ever think of wasting a moment over it—for this reason, simply, that it has long since been demonstrated to be insoluble by simple geometrical methods. So that, when a man says he has squared the circle (and many will say so, if one will only give them a hearing), he shews that either he wholly misunderstands the nature of the problem, or that his ignorance of mathematics has led him to mistake a faulty for a true solution.

BABBY JOHN.

Babby John was not a baby at all, but the Kafir corruption of the Dutch for our English baboon. Babby John—'a fellow of infinite jest, of a most excellent fancy'—was my tame baboon.

When I became possessed of this treasure, I was living in Pietermaritzburg, the capital of Port Natal, South Africa—a place which, previously unknown to most stay-at-home Englishmen, has recently acquired quite a celebrity as the abode of Bishop Colenso and his Zulu tutor in divinity. In a suburb of this town I had a little bachelor's cottage, where I lived with a naked Kafir as my henchman, and cultivated the acquaintance of the brute creation, of which I had a collection which made gardening out of the question. I laid

Digitized by Google

out, or rather left alone my little domain to be a miniature menagerie, and of all living things to grace it I coveted a baboon. Now, Babby John was an established favourite at a hotel in the town, but the proprietor became bankrupt, and on the sale of his assets I became the delighted purchaser of his pet.

Arrived at home, my first care was to lodge Babby John for the night, till I could secure him properly in the morning. Among his native rocks and wilds, his genius might have found a thousand ways of diverting itself; but being in captivity, Babby John was wont to employ the whole powers of his mind in the devising, and the whole powers of his body in the perpetration of mischief. Like Shakspeare's Don John, 'Any bar, any cross, any impediment was medicinable to him.' For the first night, I tied him to a post in the verandah. He had a bit of bread and half a cup of coffee, then curled himself up and went to sleep, as I thought, for the night. Early in the morning, I was awaked by loud exclamations and guttural 'wanghs!' from my Kafir, and, on proceeding to learn the cause, discovered Babby John, though it was barely light, at work with a zeal worthy of a better cause. He had pulled up all the tiles, forming the pavement of the verandah, within his reach, broken all he could, and thrown the rest away. When I came to interrupt his pastime, he was hard at work on the house-wall picking out the mortar with his long lean fore-finger. He had already removed two or three bricks, and bade fair to make a considerable excavation in an hour or two. Without stopping for a moment in his work, he was making most diabolical grimaces whenever the Kafir approached him.

Next, I tied him up in a grove of Syringa trees; here he waged war against all passengers. Threatening, chattering, screaming, shewing his teeth, wrinkling his brows, and exhibiting his white eyebrows till he seemed as if he was being worked by a string inside like a doll, he effectually stopped all passage. Once or twice he laid ambuscades by concealing himself on a bough, and incontinently dropping on the head of any one passing beneath. Next, I fastened him to a tree in a hedge where he could do no possible harm. But here again his talent for ambuscades was so conspicuous that I heard screams all day long. His 'custom of an afternoon' was to lie snugly concealed at the top of the hedge; and when any one approached unsuspectingly on the road, Babby John would launch himself at his or her head; and though always brought up by his chain, still, to say the least of it, the totally unexpected apparition of a flying baboon *was* trying to the nerves.

After a day or two of these vagaries on the part of Babby John, I was favoured with a visit from my landlord. I found this gentleman standing in the garden, within easy reach of Babby John, whose thoughts, however, were apparently like those of the Dying Gladiator, 'far away,' as he sat with his back to us, picking his teeth with a thorn. 'Beg pard'n, sir,' said my landlord, 'but I've been ast to call by several parties respectin' that there hape, which he carries on to that extent, sir, what with a-throwin' of hissell at parties' 'eads when parties is a passin', and makin' of them there ojous faces, as well he knows how, specially at female parties, when female parties is a-passin', that—— O gemini! help! murder!' A sound blow with a stick dislodged Babby John from the terrified orator's shoulders, and prevented a laudable design he had conceived of pulling up that gentleman's whiskers by the roots. Many were my apologies, and I promised that for the future Babby John should lead a perfectly secluded life.

I now began to feel I had a most unmanageable pet in Babby John, and to think that if those ancient mariners of Solomon, who, in company with the navy of Hiram, went to Tarshish for apes and peacocks, returned with a cargo of Babby Johns, truly they had but a wearisome passage home.

Determined to place Babby John where he would be entirely harmless, I found a vacant space at the back of my cottage, and there I fixed a pole in the ground, to which I fastened Babby John, and indulged him with a chain of eighteen or twenty feet in length. I also furnished him with an old tin packing-case, which might serve him as a shelter by night, an umbrella by day, and a shield wherewith to shelter his ugly face when any visitor took a fancy to throw stones at him. The herbage in the spot I had selected was rank and luxuriant, and Babby John, when placed in his new abode, was entirely lost for a time to external observation. The novelty of his situation, and the variety of occupation suddenly thrust upon his hands, at first seemed almost to bewilder him. But soon recovering his presence of mind, he devoted himself to a thorough survey of his premises—at least I supposed so, judging from the constant movement in the grass, and the occasional apparition of a green arched back, when he gave a kind of 'buck jump' to express his light-heartedness. His next duty was, as became a colonial settler, to make a clearing. This he accomplished in the most workmanlike manner in the space of a few days, grubbing up most of the grass by the roots, and in a wonderfully short time causing his domain to appear as bare as a turnpike road. He did not, however, in the course of his practical labours neglect the duties of a savant. It was clear that all insect life was to be inquired into and banished, and accordingly very few beetles or small insects of any kind escaped an anatomical investigation. He had (what philosopher is without his weakness?) a superstition on the subject of lizards, and, when he met one, screamed and made faces at it till it retired. All the frogs and toads he saw he chased, caught, and then threw away. But in removing a thick tuft of grass, he discovered a snake; then his terror knew no bounds; it was by turns abject and frantic. He flew round his pole till he resembled a firework, and tugged at his chain till it snapped; when free, he rushed into the house, and sought shelter under my bed. Extracted from this hiding-place by the tail, he clung with the most suffocating fondness to my neck; nor, till he was satisfied that the snake was really gone, could he be induced to return to his pole.

Babby John frequently broke loose from his chain. It was to no purpose that I bought new and stronger chains; some part—the staple, the buckle, or a weak link—would in time yield to the efforts prompted by the thoughts of freedom which throbbed in that little hairy bosom. When he did get free, one was not kept long in ignorance of the fact; shrieks of chattering joy from the escaped prisoner, yells from the Kafirs, screams from passers-by, and the clash of chains over neighbouring roofs, proclaimed the glad news. At

Digitized by Google

times, he contented himself with taking possession of my own roof, where his favourite pastime was to pull off the tiles, and throw them down the chimney. The only way to cajole him from 'that bad eminence' was by the offer of a glass of gin and water. This was a treat he, like many of his human brethren, could not resist. It cost him a pang, to be sure: he knew that he would be seized by the tail, and consigned again to captivity, if he descended to obtain the refreshment; but (O Father Mathew!) the temptation was generally too strong. At times, however, he would rush off at once to neighbouring premises. He seemed to know that his career of freedom would be short, and therefore, on these excursions, endeavoured—and I must do him the justice to say—generally with success, to eat the greatest quantity of fruit, and do the greatest amount of mischief, in the shortest given time. In upsetting anything, his talents came out very strong. Once I caught him on my dinner-table, busily employed in mixing the vinegar with the mustard, an operation which he effected with the air of a philosopher performing a chemical experiment.

One out of many of his pranks I particularly recollect. I heard one day so loud a chatter of pleasure and defiance, that I knew at once Babby John was at liberty. I rushed out of the house just in time to see him disappear in the direction of a house inhabited by a man of exceedingly irascible and litigious temperament. Not a moment was to be lost, for I knew that Babby John would at once proceed to obnoxious exploits, and accordingly I started at full speed in pursuit. But I had a considerable distance to go round, and the pursued had taken a more direct route. When I got to the house, I found all the windows and doors closed, the children screaming inside, and the owner, whose face was scarlet with fury, engaged in filling his pocket with large stones. Assuming an air of persuasive humility, I inquired, with all the politeness I could muster, whether he 'd seen such a thing as an escaped baboon there or thereabouts.

'You call 'im a baboon, you do?' he said pantingly.

I submitted deferentially that my description of the animal was zoologically correct.

'Then,' he replied, 'you may call 'im what you like; but I call 'im' (the rest of his definition may be best described as consisting of various parts of speech).—'What 's he been a-doin' on? Well, this is what he 's been a-doin' on. He 's been a-climbin' up the back of my 'ouse, and then a-droppin' permiscus on the 'eads of my children as were a-playin' in front of my 'ouse.'

'Yes,' said a shrill female voice from the partially opened window; 'and it 's a mercy and a goodness gracious blessin' if they don't have fits for the rest of their little lives.'

'May you,' continued the husband, in answer to a question of mine most meekly put—'may you come in an' capter of 'im? No; I'm dashed if you may.—What 's he a-doin' on now? Well, this is what he 's a-doin' on. Why, he 's a-settin' as unconcerned as nothin' in the back-garding a-rootin' up the inions.—What am I a-goin' to do with 'im? Why, I am a-goin' to kill 'im with these 'ere stones.'

So saying, he left me, and proceeded to the attack. I watched from the road. Babby John was fully equal to the occasion; in fact, he shone. He ducked, dived, jumped, and pirouetted in the onion-bed; he 'disguised fair nature with hard-favoured rage;' he used a flower-pot as a shield, and was critically interested when a stone broke it. And finally—but not till the patience and stones of his assailant were alike exhausted—he came home with an armful of spoils, and was peaceably secured.

The end of Babby John was tragic, though strictly in keeping with the tenor of his life. I gave him to a pastrycook; and after a week's residence in his new quarters, one night he broke loose, and entered burglariously into the shop, with intent to commit a felony. The crime produced its own punishment, for the next morning, Babby John was found stiff and stark on the floor, having, to say the truth, eaten himself to death with tarts. His white closed eyelids shewed ghastly in his swarthy visage, and his lithe black hands were clasped, in the pangs of indigestion, over his distended stomach.

Poor Babby John! He made, as far as appearances went, a very indifferent corpse. 'He who had bent him o'er the dead' would, in Babby John's case, scarcely be inclined to seek another opportunity of doing so. In fact, a 'late lamented one' of the monkey tribe is *not* a pleasing object; and therefore, let me seriously advise any intending emigrant, who may perchance some day be compelled to dine off monkey, not to see his dinner before it is cooked and served. Nevertheless, a common green monkey baked in a pie with slices of bacon is not bad eating. *Experto crede.*

IN AN OLD CHURCH.

THROUGH the chancel, quaint and olden,
Streamed the evening sunlight golden,
Firing purple pulpit-stair,
And the aged preacher there.

Sweet the solemn anthem soared,
Note on note, and word on word,
Ringing through the long defiles
Of the dim and ancient aisles.

And upon its calm surcease,
All the air, with inbreathed peace,
Seemed to gather force, and sway
Through the temple, either way.

And the preacher's tones at length
Rolled in circuit, gathering strength,
Swelled around the lofty nave,
Like a sea-hymn in a cave.

Echoing from the walls around,
Psalm and prayer, with sweet rebound—
Psalm and prayer, and discourse given,
Passed, or seemed to pass, to heaven.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 265. SATURDAY, JANUARY 23, 1869. PRICE 1½d.

THE GENTLEMAN ON MY LEFT.

SOME twelve months ago, I attended a public dinner at the Freemasons' Tavern, London. The object of the dinner was to do honour to a distinguished Englishman; the price of tickets, one guinea; the attendance, in number about two hundred. Some persons find a relish in describing old dinners, and eating them over again in imagination; but this is a sort of chewing the cud very distasteful to me. I do not propose, then, to revive the dinner, but to direct attention to the gentleman who sat on my left, and his extraordinary revelations.

His age was about five-and-thirty; his manner, singularly easy and self-possessed, shewed me from the first that his experience of public dinners was more extensive than mine. He was irreproachably dressed, and I do not grudge describing him as a handsome man.

During the pauses of dinner, we conversed. The commonplaces with which we began were distinguished, on his part, by critical remarks on the arrangement of the table, with which he found much fault, and the bad service of the waiters; on mine, by a humble acquiescence in a judgment I felt to be matured by much longer study of such things than my own. I then hazarded another commonplace, to the effect that I concluded him to be a great admirer of the distinguished guest to whom we were doing honour. O dear, no—not at all; he certainly had heard his name, but had no idea what he was celebrated for.

I ventured to ask, apologising if the question were out of place, why he had paid a guinea to be present at a dinner to a man he knew nothing about.

'I attend here professionally,' he explained, and immediately became absorbed with his knife and fork. I turned over in my mind all the professional capacities in which a person may attend a dinner—the Press, Music, Toastmaster—and then tackled him again. No, he was not a member of the press, nor musical; and toastmaster, of course, he was obviously not.

Was my friend (whom, for convenience, I will call Mr Blain) of the medical, clerical, or legal professions? He might have belonged to any one of them from his appearance and manner.

'O no,' he replied, with something of wounded dignity at the bare idea.

I admit being inquisitive, and I had made up my mind I *would* know what he was, but to all my inquiries he simply answered No. I then confided to him my own occupation, and by rather recklessly talking about myself and my own affairs, sought to merit his confidence in return. But he was obdurate. Dessert passed—toasts passed—speeches were said and done. Mr Blain rose to go. He said: 'You tell me you are stopping at the *Charing Cross Hotel;* so am I. We may as well share a cab.'

It was in the cab Mr Blain first intrusted me with the nature of his profession. Although peculiarly abstemious at the table, the toasts he had drunk just served to make him communicative. I was utterly confounded when he said: 'My calling, as you seem curious to know, is that of *Waiter.* I take a high rank in that profession. Allow me to offer you my card; and should you at any time—— you will know where to get something done in style, and not as you have seen it to-night.—You wonder at my paying a guinea to attend a dinner? Understand, then, that I make it part of my business to attend dinners privately, in case I may pick up a hint, for I don't despise learning from inferiors. I could never keep pace with the times but for seeing the latest fashions in waiting as interpreted by others, however humble their position may be to mine. If I learn nothing else, I always, in a private capacity, discover some want which I can in future supply. To-night, the waiting was highly inartistic, and discreditable to the profession; but its very omissions are instructive to me. Look at the napkins, for example. Dis-grace-ful! If there is one thing more than another in which a man of talent may display the resources of a cultivated mind, it is napkins. What did we have? Only five styles, continually repeated, and those the

Digitized by Google

very commonest, familiar to a benighted Boots—the single mitre, the boat, canoe, shoe, and slipper. How the public endures it at a guinea dinner puzzles me. That is my style at two-and-six per head. At a guinea dinner for one hundred persons, I give one hundred different designs in napkins, all of them artistic—tulip, lily, rose, *fleur-de-luce*, fountain, the five orders of architecture, pheasant, double mitre, and so on. Then, for the Chair and the Vice, the double fan, the finest conception of a napkin extant. I never saw the man who could fold the double fan quicker than I. It takes me half an hour, every minute of it; and will fold two out of three for a wager. When I say two out of three, I mean you can't always depend upon the laundress. You must have a yard-and-a-quarter napkin, starched as stiff as pasteboard, to turn out a work of art, and you can seldom get them starched up to it. A professional man would not risk his reputation by attempting to fold more than two out of three, not even if he is acquainted with the laundress.'

The cab stopped. I took out my purse. 'O dear, no; allow me, if you please,' said Mr Blain. He insisted on satisfying the cabman, and then invited me to his rooms to take a cigar. The apartments he occupied were some of the best in the hotel. Divining my surprise at the sumptuousness of his quarters, Mr Blain proceeded: 'You have no doubt been under the impression that as a class we are poorly paid. Our services are perhaps not recognised by a grateful public as they deserve, especially when attendance is charged in the bill; but it is a very poor head-waiter's place at a first-class country hotel that does not bring in three hundred a year. For my own part, I don't boast, but my income as a waiter is about eight hundred a year in a provincial town. My wages are a pound a week. Don't misunderstand me. The balance is not perquisites. I reckon hotel perquisites at not more than a couple of hundred. But let me explain, by telling you a little about myself.

'The *Golden Lion* is the oldest hotel in our town, a posting-house. We get good families stopping with us, and we have the town-club meeting there. I went to the *Golden Lion* ten years ago, as second-waiter. That's a bad berth. Suppose, now, you are a family, just come into our hotel. Our first-waiter comes and bows to you, shews you your apartments, and rings for me to wait on you. I attend you till the bill is wanted, then I have to fetch the head-waiter, who receives your money, and pockets all the pickings. It's hard lines on me, the second-waiter, as I look at it with a second-waiter's eyes, but not so when regarded from the position of first-waiter. You see, everybody must learn, and pay for learning. As head-waiter, you are responsible for everything, and have to teach everything to your junior, so it's only fair you should take what little there is to take, regarding it as a premium from an apprentice.

'You may think there's very little to learn in waitering; but then you don't know. In the first place, it takes a man five years at least to learn how to lay a cloth. No one has ever been known to do it under, not as it should be done. Let me see a man once put a cloth on a table, and I'll tell you to a year how long he has been in the profession, only by his knack of doing it. And when he lays the knives and forks, I can tell you how he keeps his pantry in order. Then there is the acquiring of an even temperament. No apprenticeship will ever teach that, except you have a natural gift for the profession. Whatever is said at table, you must take no notice. If your dinner-table, or family, as it may be, is in a roar of laughter, you must look like a mute at a funeral. If they were to describe an earthquake that has just taken place in the next room, it mustn't shock you, or disturb your unruffled countenance. Again, think of the strain upon the intellect. Take, for example, a public dinner, like to-night. One waiter to every ten persons. That waiter has to calculate to a nicety exactly how much every one of his people has eaten and drunk, and exactly what every one will want next. He has ten appetites on his mind in different stages of repletion, and his profession *as* a waiter is to forestall every want with such tact that no one shall ever ask him for anything, I mean no one of good taste or cultivated appetite, for there *are* people we unfortunately have to do with will bellow out: "Waiter, more soup," instead of lifting a finger to indicate their vulgar requirements. Of course we are not responsible for such unseemly exhibitions of depravity; but, in any other case, for a waiter to be asked for anything is sufficient to ruin him for life. I knew a waiter once, a most exemplary man, who had the reputation of having never forgotten a single requisite of the table. A gentleman once rang for him—"Waiter, there are no salt-spoons." He looked round, and saw it was too true. He said he would go and get them. He went—where to, nobody ever knew—it might have been to London—or it might have been into the river—his reputation was gone, and his body was never found, but he never sent for his clothes, which shewed he was either dead, or else so ashamed of himself that he would have liked to be.

'But these are trifles on the very threshold of the profession. When you get to be a head-waiter, you find how difficult it is to make the public part with its coin, in a copious manner, for gratuities, without becoming ill-tempered. A young hand fails to impress the public with that sense of the total indifference to silver which a master of the profession will render respectfully apparent without saying a word. A young hand trusts to his tongue: "Please to remember the waiter"—the public parts to the amount of half-a-crown, and growls. An old hand never asks for money, but makes the public feel as if it were cast away on a desolate island, without a friend or any means of communication with the outside world, except through the person of a very gentlemanly and superior being, who first makes them alive to their abject dependence on his pleasure by coy neglect, and then, by ministering to their wants at the last moment, appears to them in the light of a deliverer. It takes a deal of study to learn how to awe the public, and make the public feel its inferiority, and to know the exact moment to exchange your policy of neglectful indifference for one of condescending readiness to oblige before aggravation sets in. But once make the public feel its obligation, the public, if gentlemanly, will "part" freely. If not so disposed (and you can tell in two minutes after they come in the house), you abandon them to the second-waiter, or third if refractory, and never deliver them from his ignorant inattention.

'I worked my way on till I was appointed club-waiter. I got a young hand to take the public-room, billiard, and reading-room, and as I knew

Digitized by Google

pretty well the average takings for gratuities in those rooms, I was able to keep a sharp eye on him. When I thought he robbed me less than usual, I would give him a shilling or two for his honesty. These rooms brought me a pound a week. My own attention was confined to the card-room; that was good for four to five pounds a week certain—not every week alike, mind you, but one week with another.—How so? I'll tell you, and you will know why I never missed the card-room bell.

'The members would sit card-playing in perfect silence—not a word spoken for hours. Whenever I saw an empty glass, I filled it; never asking for the money lest I should disturb the play. I made it my business to know what every member drank, and to supply him with that. It was my duty to tell them when it was twelve o'clock. I would respectfully do so, when a rubber was over. "Draw the curtains, Henry, so that the light don't shine through those cursed shutters; put out the gas all over the house; lock the front door; and go to your pantry."

'Down I would go, and sleep till three or four in the morning, when my gentlemen would always wake me up, so that I shouldn't get into a scrape; and they always paid half-a-crown, and sometimes a crown apiece for waiting for them. The winners (as is generally the case with gainers at cards, "light come, light go," you know) were particularly generous. Thus my perquisites as club-waiter would run to two hundred and fifty per annum, and my wages another fifty.

'I might have done very well at that, but it was not improving myself in the profession of waitering in its higher branches of cloth-laying as I could wish. So, when the head-waiter was compelled to leave, owing to a misunderstanding with one of the ladies of the kitchen, I took his place. In that position I devoted myself to the acquirement of every trick and wrinkle which could place me on a level with the most eminent waiters in the kingdom. I have never grudged a guinea to a Frenchman or a German who could shew me how to do a new figure in napkins, or a novelty in arrangement of fruit and flowers. By dint of study and judicious feeing, and patience, and observing the blunders of other waiters, and correcting them in practice, I have gained the reputation of being the first waiter in all the counties south of London. You may talk of the beauties of scenery, of handsome pictures, of fine statues—I never could see anything in any of them to compare with the beauty of a cloth well laid for a grand dinner—I don't care whether it 's my laying or another man's; I can give others credit for artistic ability when I see it. If any man who has got glass, and silver, and flowers to arrange on snow-white linen, and can put the dessert on the table at the same time, can't make a picture out of his work, he has no soul for the highest walks of art. I would recommend him, as a friend, to go into the church, or take to painting or literature—or to any kindred employment which may be congenial to his intellect.

'After the dessert has been removed, and the waiters are dismissed to their pantry to wash the silver, if the head-waiter, remaining with his one or two assistants behind the screen, in case anything is wanted, can lay his hand on his waistcoat and say he has not been asked for a single thing, he is a proud and a happy man. Such has been my blissful lot for many years. With that fiendish invention, "Attendance charged in the bill," the palmy days of the profession may be said to have departed. It is a most monstrous infringement on our ancient rights and privileges. A gentleman comes—as it may be yourself—stays eight days at our hotel, sees in the bill: "Attendance at three-and-sixpence per day, twenty-eight shillings." "Really, waiter," he says, "I can't give you anything in the face of this charge." "No, sir," I have replied; "it isn't to be expected; and I am so ashamed of the practice, I would scorn to take a fee from you; though I feel it right to state the waiter never receives a farthing of the money charged for attendance." This is mostly good for a crown, and besides, is really true. We *don't* get the money, so we have to make it up in other ways. It was partly from feeling that I should have to descend to many unprofessional means of eking out my salary, and partly that I felt I was wasting my abilities at an hotel, that made me leave the *Golden Lion*, and set up as a professional man on my own account.

'Our town is a large one, and great upon public dinners. The neighbouring towns are also large, and likewise great upon public dinners. I had become so well known in the town and neighbourhood as *the* waiter *par excellence*, that I had no fear of a dinner going into other hands. No one else could lay a dinner fit for those who had once been accustomed to my laying. I was not disappointed. Engagements fell in on all sides, so that I soon made about four hundred a year. Dissatisfied with this pittance, I bethought me of the scheme by which I raised my income to its present amount, which, as I tell you, is eight hundred per annum. I caused it to be known by private intimation through a dozen counties, that the only thoroughly qualified professional man as a waiter in the south of England was prepared to attend all public dinners, with a staff of competent assistants, *entirely free of charge*. The only stipulation I made was that I should have the care of the gentlemen's hats and greatcoats. This privilege is worth to me five of the eight hundred a year, all expenses paid, of which I speak.—You may stare, but it is true. Take the average of the year, I attend as many as three dinners a week in the twelve counties in question. Every gentleman who comes in to dinner has his hat and greatcoat respectfully taken from him by one of my assistants, ticketed, and placed on the oak pegs which form part of my movable stock in trade. He receives a duplicate ivory ticket. At the conclusion of the dinner, his hat and coat are courteously returned him on delivery of the ticket. *No charge whatever is made for the accommodation.* I find by careful study that, if it is left entirely to the generosity of gentlemen to give what they like, the average amount so given, take one with another, at a public dinner, for the care of a hat or coat, amounts to eighteenpence per head. If I were to *charge* this for the service, they would complain. If they were forced to pay a fixed sum *before* dinner, sixpence would look dear; but I find eighteenpence so accurately represents the appeal to the generosity of gentlemen after dinner, that I can tell to a very close shave if my assistants rob me. Shillings preponderate, of course; but the half-crowns tell up. About one person and a half give shillings to one who gives a half-crown, and that allows for one or two here and there who

Digitized by Google

meanly remark: "No charge? oh, thanks!" and sneak off without giving so much as a copper.

'I was at the banquet to Her Majesty's ministers at X. Thirteen hundred sat down. I took a hundred and nine pounds hats and coats.

'The balance of the eight hundred per annum is made up by an extensive private practice among the nobility and county gentry, where my name is a sufficient guarantee that the table will be an artistic display. And, as you have seen, I occasionally attend dinners in a private capacity, to keep myself informed of the latest novelties.

'For all this, I am not well to do. I never save money.—What is my weakness? The weakness of the profession—horse-racing, and betting on it. I take long odds, and hedge before the event, on every horse that will rise. I make a book, so that I always stand to win in any case except some very unforeseen combination of circumstances should arise; but, somehow, such unforeseen combination of circumstances does very frequently arise, and the result is that I lose. I mean to give over betting, though, as soon as I have made just one *coup* that shall land me what I've lost, and then I think I shall sell my hat-and-coat business to a Limited Liability Company, and retire on the proceeds.'

With that I wished Mr Blain good-night.

A PERFECT TREASURE.

CHAPTER VII.—MRS BLUNT AND I AND SOMEBODY.

The event recorded in the last chapter was not without its effect even upon my youthful and elastic mind; it convinced me that, in some way or other, the fortunes of my dear uncle and myself were knit up with one whom I could not but consider a most unworthy object; and I felt degraded by the connection between us and him. The shadow of the mystery of our little household cast a gloom over me, that all Uncle Theo's kindness could not dispel. Far from reproaching me with the conduct which had, without doubt, been the immediate cause of Tannajee's flight, he seemed to redouble his attempts to make Hershell Point a happy home for me; but this was only heaping coals of fire on my head. He was ill; his exertions upon that inclement night had told upon a constitution unaccustomed to our English winters: although he looked as strong and as noble as ever, he had a cough, which never left him night or day; and when he coughed, I shuddered. Unreasoning, impulsive, full of presentiments for evil or for good, I already saw my benefactor slain by the consequences of my own foolish passion. Tannajee was as well as ever, grumbling whenever called upon to attend to his sick master; silent, but scowling, as respected myself, though I was as civil to him as though he were my brother. It was the most unhappy time I had experienced; yet a gleam of sunshine suddenly struck in upon me, which warmed me to the core. It may seem nothing to many of my readers, but a few will understand it. It caused me sensations, compared with which those of mere material success in life are feeble, and even the dawnings of first-love.

One morning, there arrived by the post no less than a dozen newspapers, all directed to Marmaduke Drake, Esq. They were duplicate sheets of the *Sandiford Mercury*, a periodical the circumstances of which did not enable it to offer pecuniary reward to its contributors, but which remunerated them for their services, besides increasing its own modest circulation, by sending them twelve copies of their works in type. My *Lines to* —— had actually been published; I was in print at last. How shall I describe to that now comparatively small portion of the public that does not write for glory or for greed what emotions were mine, what being in print means to the sucking author! What type can typify type itself? which is his *summum bonum*. I may say of it what a lover of music said to his pianoforte:

> No fairy casket full of bliss outvalues thee;
> Love only wakened with a kiss more sweet may be.

But I knew nothing about Love at present, and it seemed to me that I had reached the very goal of happiness.

I gave a copy of the *Mercury* to Martha; one to the maid-of-all-work, Nancy; and even one to Sangaree Tannajee, although he could not read a line of English, and not unnaturally set down my generosity as only another instance to be added to the long category of insults he imagined himself to have received at my hands. He managed to find out what was the particular attraction to me in the paper in question, and lit a cheroot in my presence with my deathless lines. As to my uncle, I gave him three copies; thus only retaining half-a-dozen duplicates for my own private delectation. The provincial printer had made about as many mistakes as there were lines in the poem, and though I corrected them carefully in each case, my heart bled to think what a false impression must be made on those hundreds of readers who saw, for instance, 'posture' in the place of 'pasture,' and 'silver forks' in that of 'silver frost.' It is not my intention to inflict upon the public those early (or later) productions, under which my kind-hearted editress suffered so patiently, but still I feel I owe it to my genius to set it right with the world in this particular case, wherein it has been so sadly misrepresented. The *Lines to* ——, too, were in fact addressed to Mrs Eleanor Blunt, and have therefore some general interest—or rather they did have at that time, for the great reputation of that charming writer has faded with each revolving year, and the present generation of readers worships other literary gods. At all events, the poem will give a fair idea of my quality as a verse-writer at the age of sixteen, or (by our Lady) nigh seventeen, and may so far serve to illustrate this little life-story. Looking back at it through these many, many years, it really seems to me to have some touches of grace about it; and certes I could write no such sonnet now, were it to save my life.

LINES TO ——, ON NEW-YEAR'S DAY.

> Dear Lady, and kind friend, my love to thee
> (But tell not thou the lady of my love *);
> Through all this New-Year's Day be blue above,
> And silver frost † on earth; from tree to tree
> The wreathed diamonds we poets see,
> And all the country round which thou hast made
> Thine own, and ours—heath, pasturemead, and glade—
> As thy glad heart would have it, so may't be!
> A happy year; a new year rich in good

* I need scarcely say that this was only a gallant conceit.

† Imagine my feelings at 'silver forks' in place of this!

Digitized by Google

(For so I know to thee the happiest year);
Amid the poor, less frowns and better cheer;
And more like thee, to teach as teachers should,
Who, coming across my heart this Christmas-time,
Of love and graciousness could scarce escape a rhyme.

I must honestly confess that I do not think my uncle understood one word of all this, any more than Martha, or Nancy, or Tannajee; and that even if I had left uncorrected those infamous misprints, he would hardly have discovered their inappropriateness. But he was pleased to see me so pleased, and put his three copies of the *Sandiford Mercury* religiously away in his desk, as a sacred though mysterious treasure. Being informed, however, that the poem referred to Mrs Eleanor Blunt, he quite agreed with me that I should start at once to lay that offering at her feet in person; and for Seaview Cottage I accordingly set forth with a beating heart. I am sure no lover who bears a present to his mistress ever pictured to himself her pleasure at receiving it, with brighter tints than those with which I painted my kind friend's satisfaction at what I had produced for her, from the depth of my heart and by the sweat of my brain. Nor was I disappointed with its reception. Mrs Eleanor Blunt was charmed (or she had a very charming way of persuading me so) with my little act of homage.

Even great authors, and especially authoresses, are mortal; and, perhaps touched with my simple flattery, she let her personal feelings tinge her judgment; but unquestionably she henceforth expressed a higher opinion of my literary promise. She did not now think it so much too soon to aid me to venture into print, since I had already got there without her help—although it must be confessed that the *Sandiford Mercury* was not a journal of European reputation; and we took counsel together as to how the thing should be done.

For my own part, notwithstanding this recent gleam of success, I was rather tired of being rejected by editors, who had shewn themselves worse than even the unjust judge in the Scripture, who was overcome by importunity; and Mrs Blunt, on her side, was not perhaps desirous to ask any personal favour of them on my account. 'I know So-and-so, and So-and-so,' said she, naming the conductors of some very first-class magazines indeed, to which even my ambition had not aspired; 'but I know so well what their cut-and-dried replies would be: "Your young friend must fill his basket first;" and so on. Besides, although it does no hurt to an old hand like me, magazine-writing spoils the style. I tell you what you shall do, my dear—what, at all events, will prove that you have patience, a quality indispensable to one of your proposed calling—you shall write a three-volume novel.'

This idea transported me; I could have sat down and begun at once.

'This will take you a year at least,' mused she (my countenance fell); 'and then, at eighteen, you will have entirely to rewrite it.' (It might have almost been written in my face, it became so blank.) 'Then, with a few hints from me, and some corrections, you will most likely be able to get some publisher to bring it out at his own risk, or even pay you something for it; but money will be a very secondary consideration; the point is to place yourself before the public. If the book has any worth at all, you will then have a little reputation to trade upon, and the magazines will be glad enough to get you.'

I have no doubt I still looked the reverse of enraptured with this tardy scheme.

'Such is my advice, my dear,' continued the old lady firmly; 'and it should not be unpalatable to one who really believes that he has got something in him. If you find yourself able to make an income, however small, by literature by the time you are nineteen, you ought to be more than satisfied. As it is, I am stretching a point to please you, for readers prefer seasoned brains; and any less prejudiced mentor would, I am certain, postpone your public appearance at least until you are one-and-twenty. There is no case in which the line "Raw Haste, half-sister to Delay," more exactly applies than to the literary aspirant. Indeed, were your own circumstances less exceptional than they are, you would have found me much more unrelenting.'

'I daresay you advise me for the best,' murmured I, endeavouring to look grateful.

'I am sure of it, my dear,' said the old lady quietly. 'But unfortunately, in these affairs, one can give nothing *but* advice. You must help yourself, if you wish Heaven to help you. Young people less sensible than you, but bitten by the same mad dog, have often come to me for ideas, for plots, for literary material of all sorts. Now, that's absurd: every author is bound to find (or steal) his own materials; not to mention that when I happen to get possession of an idea, I do assure you I keep it for myself.'

'I *have* got a plot,' said I, raising my head for the first time.

'Of course you have, my dear; half-a-dozen of them; and mind you take great pains to select the best. When you have written twenty chapters—that is, in about six months hence—you may come here (if I am alive), and read them to me.—You see,' added she, smiling, 'what I am content to suffer for your sake.'

'You are very good to me, dear Mrs Blunt; and I am a sad thankless fellow,' said I earnestly. 'However, I will obey your bidding to the letter.'

'There's a good boy.—Now, let us "sink the shop." Tell me all that's going on at Hershell.'

'Well, madam, my uncle (of whom, if I had been less egotistical, I should have spoken before) is far from being in his usual health.'

'What! the Maharajah ill? I should not have thought that possible! He looks to me like one who would maintain all his energies till about ninety-five, and then suddenly die in his bed.—How did he manage to get out of health?'

Then little by little, and very unwillingly, I found myself telling Mrs Blunt, who was a perfect sleuth-hound after a mystery, and delighted in it above everything, all I knew about Sangaree Tannajee and my uncle, but under the strictest seal of secrecy. It had not been actually enjoined upon me to be silent on the matter, and I really felt it a great relief to unbosom myself to such a sympathising friend. She listened with the utmost interest, and when I concluded with, 'All that I feel certain about in the matter is, that whatever hold this wretched Hindu has upon his master, it does not arise from anything of which my uncle need be ashamed,' she only nodded assent, and sat staring at the fire.

'I am too old to be astonished at anything,' said

Digitized by Google

Mrs Blunt presently; 'but certainly what you tell me is very remarkable. Now, if my friend, Mr Edgar Allan Poe, were here (one of the most sagacious men about other people's affairs, and *the* greatest fool about his own, I know), he would get at the bottom of this mystery before he slept to-night. Let us see; what does your uncle say about this fellow? "I myself may be very rich some day, but it is almost certain you (his nephew) will be so." Then: "I wouldn't lose him for so many thousand pounds;" and again: "We shall never find out his worth until he is gone;" and all the time this "Perfect Treasure of a servant," as he also calls him, is an ill-tempered and idle drunkard, and not even devoted to the master who thus eulogises him. Putting aside the idea of this fellow's having any hold upon your uncle arising from his master's misbehaviour (which I agree with you that we may safely do); still, imprudence often proves quite as strong a snare as vice, or even crime. In some way or other, Sangaree Tannajee has so secure a footing in your household, that no ill conduct can make him lose it. Your uncle evidently estimates him very highly in one sense—doubtless a material one—and yet without entertaining for him a particle of esteem. Now, the question is: How are we to reconcile this inconsistency? How are we to'——

'Madam,' interrupted I hastily, 'we are both wrong; but I am most to blame. If my uncle had intended me to find out the mysterious connection between Tannajee and our own fortunes, he would have revealed it to me himself; on the contrary, he has enjoined me not to open the sealed packet in his desk which contains the solution of this affair until after his death. Is not that equivalent to forbidding me to inquire into the matter at all?'

'Frankly, I think not,' said Mrs Blunt. 'It appears to me that your uncle is under some solemn promise—and indeed any promise would be solemn to a man of his chivalrous nature—to keep silence upon the affair himself; but the very fact of his not having laid a similar injunction upon you, proves that he wishes you to use your freedom. He did not chide you, it seems, for making your own observations upon the Hindu's misconduct, and his master's singular mildness towards him. He would have said, had he wished you to be gagged and bound like himself: "For the future, whatever you may observe in my servant's behaviour or in mine, you need take no notice." Do you see what I mean?'

'Yes,' said I; 'and I should like to believe it. Nothing would give me greater pleasure than to discover this secret, and thereby possibly set free my uncle from the trammels in which he is certainly involved. But my own idea is, that the mystery, whatever it may be, is so obscure, so altogether sunk in the past, that my uncle, himself a simple and incurious man, believes it to be wholly incapable of solution, except by the key that lies within that packet, and which he is justly convinced I would as soon cut off my hand as make use of before the time appointed. He acts with the same consciousness of safety as a man who lets his private desk lie about the house, since it is fastened by one of those letter-padlocks, the "open sesame" of which it would take a lifetime to discover by trial. At the same time, since the necessary combination might just, within the range of possibility, be hit upon by accident, he would not wish the children of the house to be trying their luck with it all day.'

'He would tell them not to do so then,' persisted the old lady.

'At all events, my dear Mrs Blunt,' said I gravely, 'I must beg of you'——

Here I was interrupted by the entrance of a servant announcing a name which I did not catch, and ushering in a young lady, who threw herself into the arms of my hostess with affectionate warmth.

'You dear little darling,' cried the latter; 'how glad I am to see you back again! And only to think of your thus flashing in upon me all of a sudden like a sunrise at sea! How dared you do it?—And you—yes, you'—and here the scornful finger of Mrs Eleanor Blunt caused me to blush from head to heel—'how dare you, sir, to come from Hershell Point with what you call your news, and never to say a word about my Rosa's return to England?'

CHAPTER VIII.—MISS GLENDELL.

'My Rosa,' as my literary godmother called this unexpected stranger, was a girl of about my own age, dark as an Andalusian, but tall, and so frank-faced, that you could not mistake her for aught but Saxon. Her cheeks, aglow with brisk walking through the frosty air, grew yet more crimson as her attention was thus drawn perforce to me by Mrs Blunt's appeal. I had never seen her before, but I could make a very good guess as to who she was.

'I did not know this young lady was expected so soon at home,' said I, 'far less that she had arrived.—What a pleasant surprise you must have given to your father, Miss Glendell; he has so often spoken about you to my uncle and myself, who are very warm friends of his, you must know;' and I stepped forward and held out my hand with my best air.

She took it without the least embarrassment. 'I have often heard,' said she, 'from Mrs Blunt here, as well as from dear papa, of Mr Marmaduke Drake, and his uncle, the ex-maharajah;' and a sunny smile lit up her glorious Spanish face. Her tones were soft and low, but very distinct. She had the easy grace of a woman of the world of twice her age. For the first time in my life, I felt abashed, confused, and subjugated: she was mistress of herself and me.

'Well, it seems you don't want an introduction to each other, young people,' observed Mrs Blunt, regarding us with a pleasant twinkle of her eyes. 'You must be good friends, you two; you may be of great mutual service to each other; for this young gentleman, Rosa, is in a position to give you lectures on the British Classics, which I daresay you have shamefully neglected while in Frogland; and this young lady, Marmy, can teach you French, besides every modern accomplishment that was ever heard of.—So you are "finished" now, my dear Rosa, are you? A perfect professor of languages and the fine arts, including calisthenics and the use of the globes, eh?'

'Yes, my dear madam; or, at all events, thank goodness, I have done with Paris, and have come home, to be with dear papa a year. He has promised himself that treat, as he calls it, before I go out'—here the young girl hesitated, then added, with particular distinctness, as though ashamed of a weakness she had overcome—'before I go out as a governess, you know.'

Digitized by Google

I felt myself growing scarlet: the idea of this lovely creature being compelled, at so early an age, to work for her own living, made me quite indignant.

'A year hence will be about the time that you too, Marmy, will be making your first appearance on the stage of life,' observed Mrs Blunt. 'I shall regard your *débuts* with interest, for you have both, in some sort, been my pupils; although you, Rosa, have been so long a truant, that you must have forgotten my instructions years ago.'

'I have not at least forgotten your many kindnesses, dear madam,' replied the young girl affectionately. 'You have no idea, by the by, how useful your letters of introduction have been to me. Madame Boncieux was quite proud of having a pupil in whom so many eminent persons professed themselves interested; and then how good you have been to correspond with me so often, you who have so many calls upon your pen. It is impossible for one to imagine, without having been an exile from home, as I have been, how welcome is the handwriting of a friend!' The speaker's eyes filled with honest tears. Her manner, which had a certain graceful demonstrativeness about it scarcely English, was so inexpressibly touching that I could have wept myself.

'My poor Rosa!' exclaimed Mrs Blunt with tenderness, 'it seems to me your fate has been a hard one.'

'Not at all, dear madam,' replied she cheerfully; 'for I assure you I have been almost always treated with consideration. My aunt, who sent for me to live with her when my poor mother died, was very kind; and when God took her, it was my own wish to go to Madame Boncieux. My dear father would have sent for me home at once; but how could I learn in Hershell village to get my own living? to cease to be a drag upon his efforts? For he is very poor, you know, and is no longer young. If he had had his will, his love would have rendered me useless; he and you would have downright spoiled me; but now, as you say, I have learned to teach everything to everybody;' and for the first time she laughed so merrily as well as musically that it was clear her experience of life, however severe a burden, had not destroyed the elasticity of youth.

'And, with all your fine Parisian ways,' said the old lady, who was obviously as proud of her Rosa as though she had been really her mother, 'you have not forgotten how to walk, it seems. How nice it is of you to have trudged all this way to see me so early.'

'Well, I think it would have been good of me to leave papa,' returned the other smiling; 'but the fact is, he had to go over to Daisyport, to see a patient;' and I thought I should just have time to run down and have a kiss of you, and back again, before he returned home.—But I really must bid you good-bye now, for the present; for he is like a child with a new toy, and cannot bear me to be out of his sight.'

'If you must go, dear Rosa, you must; but since you and Marmy live at the same out-of-the-way, end-of-the-world place, you may as well walk home together.'

I blushed, and bowed, murmuring something of the great honour which I should esteem it to be Miss Glendell's escort; while the young girl expressed her pleasure with the arrangement in a much less embarrassed manner. 'Only,' said she, 'I must just say "How do you do?" to Sally, lest she should think I had forgotten her.'

Sally was the cook at Seaview Cottage; and while Miss Glendell sought the kitchen, Mrs Blunt inquired of me whether I did not think her protégée charming.

'Yes, indeed,' said I earnestly. 'But why never have spoken to me of this wonder?'

'Because I wished her to make her own impression upon you,' returned she frankly. 'There's a heroine for your new novel, sir! None of your blue-sashed, bread-and-butter young misses, but a genuine—— Hush! here she comes.—Sally is as fat as ever, is she not?—Almost as fat as her mistress, you were going to say. Well, you were thinking so, at all events; naughty Rosa!—Good-bye, my darling; teach him French.—Good-bye, Marmy; introduce her to the British Classics.—Dear heart alive,' added she with fervour, 'what would I not give to be as young as you two!'

This pleasant old lady, our common friend, of course afforded us a ready subject for conversation; and, besides, there was Rosa's father to talk about, and my uncle, about whom she expressed herself curious to hear. But there was each other's life-history also, concerning which, at seventeen, one is by no means reticent. That of Rosa I was already in part acquainted with from her own lips; and she now completed what was wanting. Having lost her mother at an early age; and her aunt, who lived abroad, volunteering to take charge of her, Mr Glendell had very unselfishly parted with his little daughter, for the sake of her own future benefit. His widowed sister was reported (falsely as it turned out) to be in good circumstances, and it was hoped would make the child her heiress. But she had died poor. Rosa, declining to return home, to be a burden upon her father's scanty resources, had been educating herself for the last three years, with a view to getting her own living as a governess, which she was now fully competent to do. As for me, I spoke of my own affairs with a candour that was half-frankness, half-egotism; and they seemed to interest my new companion mightily. The idea of choosing literature for my profession in life delighted her; much as a young gentleman in the middle ages might have pleased some youthful maiden by the confession that he intended to devote himself to knight-errantry. She had been introduced through Mrs Blunt to some eminent men of letters in France, all decorated with ribbons or crosses, and to whom Madame Boncieux had evinced an unwonted respect; and she esteemed that calling very highly. Even in France, it was exceptional; but in England, save our friend at Seaview Cottage, she had never met with an author. 'How droll!' (this expression I did not quite approve of); 'and had I written much? And was it prose or poetry? She doted on poetry. They read Voltaire's *Henriade* and Lamartine's *Napoleon* at Madame Boncieux'. And were these charming things in manuscript, or were they actually in print?' How I blessed the editor of the *Sandeford Mercury!* Twenty-four hours ago, I should have had to confess that I had never written anything that had been published; but now I replied with affected carelessness that 'some of my works were in print, and some were not; nay, it did so happen, by the by, that I had in my pocket at that moment a printed copy—if she would do me the favour to accept it—of some verses addressed to her old friend and mine, Mrs

Digitized by Google

Eleanor Blunt.' I would not permit her to read them, as she wished to do at once, upon the open road, which I did not consider a favourable spot for their proper appreciation; but when we reached her home, and found the surgeon had not yet returned, the *Sonnet to* —— received the most favourable criticism; and I promised, without much pressing, to shew her some more productions by the same hand.

I was already charmed by this beautiful young creature's air and appearance; but now that I had come to know the capabilities of her mind, 'Here,' said I to myself, 'is Perfection indeed!'

When Mr Glendell came home, we found he had been not only to Daisyport; he had called at the Point on his way back, to see the ex-maharajah, upon whom he always now looked in twice or thrice a week.

'You found my uncle better, I trust?' said I, after some talk.

'Well, the fact is, Marmy,' observed the surgeon gravely, 'I am not easy about the ex-maharajah.'

'Good Heaven! sir,' cried I, seizing my hat, 'is my uncle ill?'

'Not in the sense you mean, my lad; he is no worse than he was yesterday, for instance. But strong as he looks, and indeed is, as respects mere vigour, there is something wrong with his lungs, I feel convinced. I have persuaded him to-day, for the first time, to let me use the stethoscope; and the result is far from encouraging.'

'O sir,' said I, turning suddenly pale, and feeling my heart, that had just been beating so blithely, become as cold as a stone, 'must my dear uncle die?'

'Nay, nay; I don't say that there is anything so serious the matter at present; but his constitution, outwardly iron-plated, has a weak spot within—a fact which I believe he has himself long suspected. Whether that be so or not, he received what I thought it my duty to tell him this afternoon with the utmost coolness. His only anxiety is upon your account, Marmy.—What a fine, brave, unselfish fellow he is!'

'Yes, Mr Glendell, and as tender-hearted as any woman.'

'Ay, Marmy, he has been, indeed, as you once told me, mother as well as father to you. Against that, there is nothing to be said, for you have been a good and dutiful lad; but this kindness of heart in him in some cases becomes mere weakness. I protest that the conduct of that Hindu villain, whose life he saved, but at the expense of his own health—for that night's work upon the downs has brought out all the dormant mischief into activity—fairly makes my blood boil. At this moment, that copper-coloured villain is drunk; and your uncle, who needed his attendance, and of course applied for it in vain, has nothing more severe to say than "Poor fellow." It 's worse than weakness—it 's downright wicked. Why, there are a dozen honest men in this village who would make Mr Braydon good and faithful servants, in place of this lolloping heathen, and yet he persists in retaining him. Moreover, what seems so odd, I verily believe your uncle knows him to be a worthless scoundrel. What do you say, Marmy?'

'I don't think Uncle Theo has a very high opinion of him,' said I evasively, for my conscience was still tender concerning the revelation I had already made upon this subject to Mrs Blunt.

'Well, then, why does he keep him? Why does he put up with him? There must be some uncommonly strong reason for it, you know.'

'I am sure I don't know, Mr Glendell, nor even suspect.'

'Then all I can say is, that you are a very stupid fellow (Don't you think so, Rosey?), to have lived in the same house a dozen years, and never to have discovered the skeleton in the cupboard!'

'Sangaree Tannajee is not much like a skeleton,' said I with a forced laugh, 'as I am sure Miss Rosa will say when she has seen him.'

'It 's no laughing matter, Marmy,' pursued the surgeon. 'Setting aside the inconvenience of having such a brute in your house at all, it is just now absolutely necessary that your uncle should be closely looked after and well tended. He is careless of himself, and needs to be reminded to take his medicine, and the nourishing food that has become so necessary to him. Martha and Nancy are well-meaning women enough, but forgetful and boorish. A good body-servant would be, just now, invaluable about your uncle, and instead of that, here is this drunken baboon.'

'If you will only tell me, Mr Glendell, what you wish my uncle to do,' pleaded I, 'I will answer for it nothing shall be forgotten; he need not surely require a servant when I am by his side to minister to his wants. It would be a very small return to make to him for all he has done for me, even should I become his valet and his nurse.'

'My good lad, I know all that,' said the surgeon approvingly; 'but, unfortunately, he would never let you do him any such service; although, from a servant who knows his duties, he might accept it as a matter of course.'

'It seems to me,' said Miss Glendell rising, and putting an arm round her father's neck, 'that this dear ex-maharajah, whom you and everybody loves so much, is one of those impracticable persons who hate, even when ill, to give their fellow-creatures trouble, and have an absurd disinclination to be nursed.'

'That 's just so, my dear,' answered the surgeon, chuckling with pride, as a hen chuckles over some promising chick. 'You could not have described him better had you known him all your life.'

'Very well, papa, then I tell you what I mean to do, now I shall have so much idle time on my hands. Among other accomplishments I learned at Madame Boncieux'—where there is a school infirmary—I learned to nurse; and I shall just take this ex-maharajah into my own hands, and nurse him myself, without his knowing it.'

UNDER THE SEA.

Among the very few Frenchmen that seem capable of understanding England and the English, M. Alphonse Esquiros holds an honourable place. His opinion of us is, on the whole, good, yet by no means enthusiastic; he endeavours to regard us not as enemies of his own people, but only as their rivals in the great work of civilisation. It is easy to see that he has some contempt for our immobility, our incapacity for getting excited about an idea; while, on the other hand, he is ready to acknowledge our superiority in practical matters. Our scientific acquirements evidently excite his admiration, and his account of them—as instanced in various government departments—is singularly graphic. At the same time, he is greatly given to digression. His latest work, entitled *English*

Digitized by Google

Seamen and Divers, might with greater truth have been entitled *English Seamen and Divers other Matters*. A third of the volume is devoted to a very detailed and interesting account of Greenwich Observatory, and the work carried on therein. He tells how Professor Airy is worried by applications from persons who confuse astronomy with astrology, and demand of the astronomer-royal to have their horoscopes cast, though it is fair to add that they also enclose postage-stamps to repay him for his trouble. But not only does the professor decline to inform young ladies whom they are to marry, or to give advice, drawn from a celestial source, to young men as to their future conduct; he sets himself resolutely against all dealings with the stars which are not of the most practical character. He leaves to other establishments the occupation (so dear to human nature) of discovering spots in the sun; he resists the temptation, so seductive to the astronomer, of observing the figures of the planets, the mysteries of the *nebulæ*, the eccentricities of the comets. He refused for the use of his Observatory 'the largest refracting telescope in the world,' lest it should lead him, or any member of his staff, away from their simple path of duty, which is the observation of the Heavenly Bodies, with a view to their influence on Navigation. At the same time, we must not misunderstand this to mean that the highest ends of science are neglected. What is lost in extent is gained in depth and exactness; and 'the delicate observations which are being carried on at Greenwich, on account of the very precision which distinguishes them, serve as the groundwork for the greater part of the speculative views which are taken up as to the system of the universe.'

Out of the thousands of people who yearly go to stare at the 'motor-clock,' set in the Observatory wall, and to wonder at its four-and-twenty hours, not one in a hundred, probably, has any definite idea of the practical advantages conferred by the institution before them. Without it, they have a general notion that we should lose our standards of measurement, and our accurate record of Time, and have to return to barley-corns for the one, and hour-glasses for the other. Yet it is to Greenwich Observatory that every mariner in his trouble turns, as to a faithful friend who will not deceive him. 'The astronomer,' says M. Esquiros, 'watching the celestial movements on the little hill in the park, stretches out over the immensity of the ocean a helping hand to the sailor wandering from his course on the great watery waste, and, as it were, compels the stars to lead him safe to his port. But how can this be the case, and what are the means adopted for finding out the longitude at sea? Let us imagine a vessel at the mercy of the wind at night-time, and near rocks or sandbanks which are supposed to be still far distant. The sky is clouded with gloom, and the pilot has, in fact, lost his way. Suddenly a clear spot breaking between the clouds allows a group of stars and the moon to become visible. The navigator at once consults his *Nautical Almanac*, and then, with the help of instruments and calculations familiar to mariners, he is not long in discovering, by the situation of the stars, what time it is at the spot where his vessel then lies. Next, by comparing this time with that of his chronometer—regulated before his departure by the clock at Greenwich—he easily ascertains his longitude. It is a well-known fact that in these cases the difference in time gives, by a simple rule, the difference in distance. Confidence is at once restored to the hearts of the sailors, for they now know where they are, and foreseeing its snares, can sail fearlessly over the deep.'

This *Nautical Almanac*, it should be stated, is printed years in advance, for the benefit of those who undertake long voyages; it predicts each day the position of the moon and the planets, and all the celestial phenomena that the seer upon Greenwich Hill foresees will occur, so that when the world is rolled up like a scroll, or swallowed up in fire, there will actually be an accurate record in existence of what would have taken place had it been permitted to continue for years. A curious illustration of the accuracy of astronomical observation was afforded in 1844, with respect to the definition of our North American territory. 'Between Canada and the northern portion of the United States of America there lies an impenetrable region, where dark virgin forests, deep ravines, and dismal marshes have long defied the efforts of the two governments and all the appliances of geodetical science. On account of all these obstacles, the boundaries of the two countries had not been definitely fixed in these regions. In 1843, Lord Canning wrote to the astronomer-royal to call his attention to the subject; and Mr Airy advised him to send to the spot some military engineers, to whom he, Mr Airy, would previously give some useful instructions. In consequence of this advice, some officers of the above corps repaired to Greenwich, whence, after certain preliminary studies, they left for Canada. Two groups of observers, each party being furnished with a telescope, a chronometer, and some other instruments, placed themselves at the two lateral extremities of the wild country which it was their business to divide. By means of calculations, dictated in a great measure by the movements of the celestial orbs, they traced out a boundary-line in conformity with the nature of the treaties which had been signed between England and the United States. The two parties being placed at a great distance from each other, they had no means whatever of coming to any understanding as to the progress of the operations. The studies and calculations being terminated, one of the two groups of engineers advanced slowly through the forest, cutting out a path in a straight line in the direction previously arranged, which they followed on the credit, as it were, of the stars. How great was the astonishment and joy of these gallant geometricians when, having cut their way through forty-two miles of brushwood and trees, they perceived from the summit of a hill the goal they had been aiming at! Right in front of them, on another eminence not very far off, they caught sight of a gap cut in the dense and sombre curtain of the woods. This gap became more and more extensive, and soon disclosed to view the other body of engineers approaching from the opposite side of the district. The two lines thus met end to end; the difference between them did not exceed three hundred and forty feet, and this very slight deviation was owing to an error of only one second in the difference of longitude. England and the government at Washington hastened to recognise as the boundary of the two states this line marked out by the authority of the heavens.' It is not to be supposed that the watchers of the stars on Greenwich Hill are scientific Sybarites, who, lying (often at full length)

Digitized by Google

in the most comfortable of arm-chairs, admire at their leisure the wonders of the Heavens. It is very cold work indeed to be stationed for hours on a winter's night, under an open roof, and with one's eye glued to a telescope; while the patience and microscopic accuracy demanded of these ministers of science are something that ordinarily careful and punctual folks are unable to imagine. Formerly, for observations in the daytime, they had to descend into a dry-well, one hundred feet deep, in order to see the stars, but the progress now made in science renders this unnecessary.

From the Observatory, M. Esquiros ingeniously glides—by way of 'the Admiralty'—to sailors, and from sailors to the diving-bell, whose operations he went to witness at Plymouth breakwater. It was rather disappointing to find that this instrument was not a bell at all, nor in the least like the machine M. Esquiros had seen, and descended in, at the Polytechnic, in Langham Place. It is a box of glass and iron of the shape of a parallelopiped, and capable of accommodating half-a-dozen inmates, of which our author in vain endeavoured to make one. The authorities in charge assured him that he would have a rush of blood to the head, and be deaf for days; and when that argument had no effect upon this heroic man, they told him that a descent would cost twelve pounds—which certainly seems a good deal of money for a 'dip' in the sea. However, he was permitted to watch all the operations. The workmen do not seem to have any particular apparel for their subaqueous duties, which they perform precisely as on land with axe and shovel. 'A dozen convex lenses, eight or nine inches in diameter, and firmly set in copper frames, receive the rays of the sun spread through the water. In some cases, the *bull's-eyes* are protected externally by iron lattice-work against the blows which they might suffer from the rocks or other solid matters which are occasionally met with in the sea. The light which is thus shed into the interior of the bell varies, however, very considerably in colour and intensity, according to the state of the ocean and the depth to which they have sunk. In places where the water is troubled by sand, the diver often passes through a kind of twilight or submarine fog, which compels him to light his lamp. More often, on the contrary, the light is sufficiently strong to enable one to read a newspaper printed in small type. A story even is told of a lady who wrote a letter in the diving-bell, and dated it thus: "16th June 18—. At the bottom of the sea." Her courage obtained for her among the divers the *sobriquet* of the Diving-*Belle*.'

As for the prime necessity, air, that is supplied by an air-pump, which four men keep in motion, the element passing through a leathern pipe, which resembles a boa-constrictor unwinding its coils, into an orifice in the roof of the bell. The submerged workmen have various methods of communication by signals. 'They generally make use of a hammer hung by a cord to the dome of the bell, and this hammer plays an important part in the mysterious language of these submarine messages. No noise coming from the surface of the water can reach the ears of the divers; but, on the contrary, sounds ascending from the diving-bell are distinctly heard by those whose duty it is to listen for them in the open air. A particular sense is attached to the number of blows struck by the hammer on the resounding sides of the bell. Thus, a single blow means "more air," or "pump faster;" two blows signify "hold hard;" three, "hoist away;" four, "lower down;" &c. It is easy to see that something of a system has ruled in the formation of this telegraphic language, and that the orders which they are compelled to give the most frequently are transmitted by the smallest number of blows. They also avail themselves of other means of making signals; for instance, by the help of small buoys which they send up to the surface of the water. On some occasions, they even exchange messages by means of a cord, one end of which is fastened inside the bell, and the other to the vessel up above. The workmen down below write what they wish, either with pen and ink on a morsel of paper, or with chalk on a piece of plank, and send this communication up to the surface.'

When the bell reaches the bottom, its inmates jump off their seat, and begin to dig into the moist sand to get out the stones: sometimes the water is muddy, but generally it is so transparent that even the passage of a cloud in the sky is visible at the bottom of the sea. The bell can be moved at will, by signal, through means of 'a traveller' on four wheels, running over two tramways, north, south, east, and west. Curiously enough, these workmen, who labour half their time under water, and half on the great causeway which they have helped to construct, are not paid higher than mere landsmen; sometimes by the piece, sometimes by the day, but in neither case do their wages average more than twenty-five shillings a week; and then they have their dead season, when the swell is so violent that they cannot go down into the bell. Notwithstanding the comparatively modern character of the trade, these divers have already their legends. One of them, which they delight to tell to their children, perhaps themselves to be amphibious labourers, is as follows.

'*Jack* (for this is the name given to a diver who lived "once upon a time") had been busy for some weeks in gathering up the relics of a shipwreck, when one day he saw appear at one of the windows of the bell the pale face of a woman, with long hair intertwined with seaweed. He had often heard tell of the beauty of mermaids, who are, as every one knows, lovelier than the most lovely of women; but Jack never believed that any creature so perfect as this could have existed. With a voice softer than the murmuring of the waves under a gentle breeze, she said to him: "I am one of the spirits of the sea. On account of your kind disposition, I have marked you out among the rest of your companions, and I will protect you, but on one condition only, which is, that you shall be sure and recognise me under any and every shape into which I may be pleased to change myself." The vision disappeared, and Jack remained very much surprised, but with a strong feeling of joy in his heart's core.

'From this moment, everything succeeded with him. Where other divers gained one crown, he gained three. Recollecting what the siren had told him, he took the utmost care to treat with kindness every inhabitant of the sea. When the bell went down into the water like a hollow column, he used to see distinctly a little below his feet the fish and other marine creatures; but he took pains never to frighten them away. More than once, when the bell was ascending to the surface, and the warm vapour covered with a mist the loopholes of his prison, he looked, but looked

Digitized by Google

in vain, for the vision of the *Lady of the Sea*, for he longed very much to see her again. But she never shewed herself to him any more.

'Nevertheless, everything went on prospering with him. His wife and children began to believe that it was owing to the dried sealskin he wore under his clothes, and that this brought him luck. He had not dared, in fact, to mention to them about this sea green-eyed mistress of his who watched so carefully over him. One day, however, he worked several hours in succession without finding anything of value. The ground-swell obscured the light in the interior of the bell, and prevented him from discerning the objects around him. As he was returning home in rather an ill-humour, he came upon a frightful polypus that the ebbing tide had left lying on the sand. Jack, forgetting his habits of kindness to all the denizens of the sea, crushed it with his foot, and went home to eat his supper. The next day, soon after he had reached the bottom of the sea, what was his terror to see through the glass window of the bell, not the attractive face of the mermaid, but a monstrous shark! The creature approached almost close to the face of the diver, and said to him: "You have disobeyed me, and must therefore die." *In fact*, some days afterwards, an accident happened to the machine, and Jack was drowned.'

Thus the divers have not only got their tale, but the moral to adorn it: 'Never to mix their pleasure or their pride with sorrow to the meanest thing that feels.'

Of course, so indefatigable a sight-seer and explorer as M. Esquiros was not going to put up with not being suffered to go under water; there are as good divers in the sea elsewhere as are to be found at Plymouth; and off to Whitstable went he in search of a marine experience. Here he met with John Gann, the famous contractor-diver, who undertakes works below the waves, and has had many a sturdy triton in his employ. His fishing up one hundred thousand pounds from the *Lady Charlotte*, was perhaps his greatest coup. On the coast of Ireland, too, where some Whitstable men were employed, there were got out of a sunk Spanish vessel barrels of dollars, which, though the wood-work had gone, still retained the barrel form, so that the coins were gathered in lumps like figs; and a row of houses built with the proceeds at Whitstable bears the name of Dollar Row.

Of course, these divers use the apparatus—helmet, waterproof, &c.; and hearing that some of Mr Gann's men were working at Dover, M. Esquiros hurried thither, resolved to wear that all-attractive uniform. He found his men in a ship moored at sea, from which they descended and to which they returned as to head-quarters. On a platform stood the air-pumps, with the men appointed to work them, and who are forbidden to exchange a word with anybody, or with one another, while the men, whose lives are dependent on their attention, are under water.

He watched the professional divers go about their weird business, descending into and ascending from the deep, and his soul was fired with the desire to do likewise. 'I asked the divers whether, being already so far advanced on the road, I might not attempt to descend to the bottom of the Channel in good earnest. They stared at me with wondering eyes, in which I fancied I read a feeling of doubt and anxiety. "At all events," said one of them, "he can do as he likes."'

M. Esquiros did not in reality much like it, though he was resolved to go through with it. It is one thing to feel confident that two reliable men do watch over you when under water, just as a nurse does over a child walking with 'leading-strings,' but it is another to test it—to actually intrust yourself at the bottom of the sea to their kind attentions. However, being properly encased, he actually ventured upon the experiment, with no very satisfactory result. He got to the bottom of the ladder, and even set his feet upon the floor of ocean, but he held tightly on with his hands to the friendly staircase; for the fact is, he was half-suffocated and wholly frightened—as indeed most of us would be. Wishing, however, to carry back with him a tangible proof of where he had been, and a *souvenir* of his adventure, M. Esquiros stooped down and picked up a pebble from the bottom of the sea, and was going to put it into his pocket, when he suddenly discovered that he had none. If it was kittle kattle coming down, it was 'the deil and a'' getting up again; and his dress, when he endeavoured to disrobe, stuck to him like a limpet.

This diving apparatus, however, when one gets accustomed to it, is much more useful, and more extensively used than the more cumbrous Bell. The hull of a ship at sea often receives damage which can be repaired by this means, and thus the *Great Eastern* was once preserved from possible destruction, on its way across the Atlantic. So conscious, indeed, is the government of the advantage of the apparatus, that a certain number of the sailors in the fleet are now trained to the use of it. It also rectifies much that goes wrong in mines. It is well known that the operations for raising the remains of the *Royal George* at Spithead were carried on in this manner; but although a thousand persons perished in that shipwreck, very little money was found, and only twenty-three out of the one hundred and four guns were recovered. During this work, 'two soldiers of the Royal Engineers, who had for a time exchanged their military garb for the uniform and helmet of the diver, began quarrelling, when at the bottom of the sea, as to the right of ownership in some of the remains. As they were both working at the same part of the wrecked ship, the question was, who should be the master in that particular locality, and who should appropriate the spoil. A fight ensued, during which one of the divers struck his adversary with his fist on the visor of his helmet, and thus broke the glass. He was at once obliged to go up to the surface, and the other laid violent hands on the booty.'

When a ship has sunk, the great marine insurance companies, such as Lloyd's, employ their own divers, and when they have done their best, sell the 'gleanings' of the salvage to speculators. Thus, the relics of the *Royal Charter* were disposed of for one thousand pounds; after which a bar of pure gold, weighing nine and a half pounds, was brought up, besides a box containing three thousand pounds.

In a steamer sunk off Lundy Island, destined to run the American blockade, in 1865, some very costly machinery was sunk; and an engineer, named M'Duff, went down in the apparatus—forty-two feet under water—and brought the whole of it up, piece by piece. Perhaps Victor Hugo may possibly have taken one of the most striking scenes in his *Toilers of the Sea* from that surprising feat.

Digitized by Google

From the *Malabar*, which went down in 1860, and remained at the bottom of the sea untouched for months, the whole amount of the great treasure it carried—two hundred and eighty thousand pounds—was similarly recovered.

Thus, the poet's phrase of 'the deep's untrodden floor' has no longer any application. It often presents an animated spectacle to the helmeted intruder. 'At the bottom of the sea, just as on its surface, there is a horizon by which the visual rays are limited, but the submarine horizon is, of course, much more confined in its extent than the other. Within the narrow circle which is embraced by the sight, all kinds of animated forms appear from time to time, like ships under sail on the upper horizon—very often it may be a shoal of small fish, which are swimming for their lives to escape from the pursuit of one of the devouring ogres of the ocean. On the contrary, when all is quiet, the fish, attracted no doubt by the metallic glitter, come and swim round the head of the diver like a flight of small birds, and will even imprint a kiss with their mouths on the outside of the helmet. Some of them will occasionally take more audacious liberties with their strange visitor: not long ago, a diver was bitten in the shoulder by a dog-fish.'

The Prussian engineer, M. Euber, with a companion, had once to take refuge within the shattered timbers of a submerged wreck, from the attentions of a shark, which swam round and round them with an astonished air.

The diver who has made his business in the deepest waters yet explored has only descended one hundred and sixty-five feet: this was in the Mediterranean; and he was obliged to load his belt with balls of lead, and to return to the surface every twenty-five minutes. 'One hundred and sixty-five feet! Certainly it seems a great depth; but when we hear of twenty-five thousand feet of water in certain parts of the Atlantic, it is enough to make one give up the contest in despair. Beyond forty or forty-two mètres down, the light begins sensibly to diminish. Can there be a point where light ceases to exist? There is, I think, every reason to conclude so.'

DAISY'S CHOICE.

IN FIVE CHAPTERS.—CHAPTER III.

Mr Vivian was lounging by the surgery-window, in no very good temper. He had been watching for Daisy, and she had not appeared, and that provoked him; and besides, the doctor had been away for an unconscionably long time, making his country rounds, and Vivian had been left to his own resources. In truth, he had one of those irritable tempers which are apt to accompany poetic genius, and he was easily put out of sorts. His grievances at present were not many, inasmuch as he was left sole occupant of a snug room, well furnished with books, and was at liberty, if he felt so disposed, to take his fishing-rod, and stroll down to the river. But he was in a grumbling mood, and disinclined to go out; so he sat at the window, grumbling at Daisy for staying in the house, at the doctor for attending to his own business, at the sun for shining into the room, at the flies for buzzing, and at the whole course of things in general.

Presently, the sound of a horse trotting down the street was audible, and the doctor came in, mud-stained—for the roads were soft—but cheerful.

'What! are you here still, Vivian? I thought I should find you somewhere by the river.'

'What a time you have been!' said Vivian discontentedly.

'I am sorry you have wearied. You see I must attend to my patients, even though it involves leaving you so much alone.'

'O yes, I know; only I wouldn't be such a slave as you are to these country boors, not for ten times the money.'

The doctor opened his grave eyes wide for an instant. It struck him, as he looked at the peevish face before him, that there was a worse bondage than that of honest work—a bondage to one's own whims, and fancies, and evil tempers. But his profession had, among other things, taught him reticence, so he wisely held his tongue. He went to the window, and laid his cool hand on Vivian's brow. It was drawn away, very much after the manner of a petted child.

'I think you are not quite well,' he said kindly. 'I notice that people always take gloomy views of things when they are dyspeptic.'

'Nonsense,' said Vivian, looking grievously insulted.

'Truth,' answered the doctor smiling, and going across to his big press, where he began to pour things that 'fizzed' into tumblers. 'Drink this,' he said rather peremptorily, returning to Vivian.

That gentleman pshawed contemptuously, but obeyed. 'It is not so bad,' he acknowledged.

The doctor left the room, to change his muddy attire; and on returning, he found that the whole expression of Vivian's face and position had altered. He had drawn back behind the curtain, and was watching earnestly, intently, with a curiously pleased look in his dark eyes, a figure in a blue morning-dress, that was moving about the garden. Daisy had come out to gather a bouquet for her drawing-room, and, unconscious of being looked at, she was daintily putting one bit of bright colour to another, pausing every now and then to study the effect.

It was a pretty picture to look at; but in Vivian's face there was an expression which meant something more than even pleased admiration. The doctor glanced at him, and then walked quickly across the room, and stood for a few minutes with his back to him, leaning his arm on the mantelpiece, and looking absently down into the empty fireplace. Vivian hardly noticed him. He went on watching Daisy for a little while, till suddenly turning from the window, he moved towards the door.

'Where are you going?' asked the doctor, turning round to look at him.

'Into the garden. Miss Barton is there.'

'Will you wait for a few minutes? I have something to say to you.'

Vivian looked annoyed. 'Will it not keep till another time? I want to go out now.'

'I would prefer saying it now, if you will allow me,' said the doctor. He spoke very gently, but gravely, and he was rather paler than usual.

Vivian came back unwillingly, and threw himself into an arm-chair on the side of the fireplace opposite to the doctor. 'I wish you would be quick, then,' he said discontentedly. 'Miss Barton will be gone presently.'

The doctor resumed his former attitude, leaning

Digitized by Google

on the mantelpiece, and looking into the empty grate, which was filled by no pretty device, as it would have been if a lady had lived in the house, but shewed plainly all its bare desolation. 'It is about her that I wish to speak,' he said.

'Miss Barton?' asked Vivian suddenly interested.

'Yes. I ought—I feel now that I ought to have told you before. She has been engaged to me for some time.'

Vivian had been lounging back in his chair, in one of his usual careless attitudes; now he suddenly sat upright, and stared at the doctor with flushing cheeks.

'To *you*!' he said in a low voice. 'That beautiful young girl engaged to marry *you*?'

There was something almost insulting in the way he said it; but the doctor kept very quiet. He only bowed slightly.

'And why,' Vivian went on, getting angry, 'have you not told me this sooner? I have been here a fortnight, and you have seen that I have been much with her. You ought to have told me; it was not fair.'

'Perhaps I ought. I did not think it necessary. I may have been wrong.'

Vivian rose, and walked excitedly up and down the room. Daisy was still in the garden, but he no longer looked at her.

'Carleton,' he said at last, 'you must excuse me if I say that you have not behaved well to me. And besides—really, I think that if you mean to marry Daisy—Miss Barton, I mean—you were not wise to let her see so much of me.'

There was something in this cool assumption of superiority which nettled the doctor, little as he was given to thinking much of himself. He lifted his head rather proudly. 'I trusted her,' he said.

'And you thought me of no consequence,' retorted Vivian.

This reproach was deserved, and the doctor said nothing.

'But, to tell the truth,' Vivian went on, 'I am thinking less of myself than of her. Poor little pretty thing!'

The doctor looked at him. 'Do you mean,' he said, speaking sharply, 'that you think she will not be happy with me?'

Vivian was silent. He was treading on delicate ground, and he knew it.

'Answer me,' said the doctor. 'I know you think so. Tell me why.'

'Because,' said Vivian slowly, 'during this fortnight, while I have been so much with her—your own doing, remember'——

'I know. Go on.'

'I have seen that she has thoughts, fancies, aspirations, which you could not possibly understand—that she leads quite a different inner life from yours.'

'And you think that you understand her?' asked the doctor calmly.

Vivian looked at him, and made a great mistake; he mistook perfect self-command for indifference. 'I do,' he said boldly. 'And she understands me, as very few have ever been able to do.'

He walked up and down the room again, and came to a stand-still just in front of the doctor. 'Carleton,' he said, 'have you not taken an unfair advantage of that child?'

He did not know how very near the doctor was to knocking him down at that moment. He could easily have done it if he had tried; perhaps that very fact deterred him. 'What do you mean?' he asked, without losing his outward calm.

'It is evident that you have been much with her since her childhood. You have shewn her kindness, no doubt, as you could hardly help doing in the circumstances. She can have seen very little society in this out-of-the-way place: even if she had been inclined to fall in love with any one else, there was no one in the way to be fallen in love with. You, who have been much with her—to whom she is accustomed, and to whom she perhaps feels bound by a tie of gratitude—you watch her growing up to womanhood—and naturally, when the flower has bloomed, you want to pluck it. And she—well, I can hardly speak confidently of what her feelings may be.'

'Tell me what you think they are,' said the doctor.

Vivian had been speaking warmly; now he hesitated. 'I think—that I could hardly have been with her so much, without finding out that she loved you, if such were really the case.'

The doctor leaned rather more heavily against the chimney-piece, but said nothing. He was silent so long, that Vivian went back to the window, and looked out into the garden. It was empty now, for Daisy had gone into the house, and he rested his arms on the window-sill, and looked at some tall white lilies, of the kind that are often painted in the hands of angels.

The doctor broke the silence first. 'Vivian, what are your feelings towards Daisy?'

Now, Vivian had hardly made up his mind about that. He did not want the doctor to have her, but he had not thought of marrying this little country girl himself. But he had begun a game, and it was necessary to play boldly. 'I love her,' he said in a low voice, and in so saying he did not lie.

'And if you could—if I did not stand in the way'——

'I would win her.' This perhaps was not so true.

There was another long silence. What Vivian had said was nothing new to the doctor; he had thought it often enough, in a vague way, and had been troubled about it, and now that it had been put into words for him, he felt it very bitterly.

When he spoke again, it was in a hard, dry tone. 'Vivian, you are right. I have been unfair, and she is too good for me. I love her, God knows I do. I love her so, that if she would be happier with you than with me, I 'll give her up, and say: "God bless you both."'

Vivian had not expected this, and he turned in astonishment. 'Do you mean what you say?' he asked.

'Yes. If it is as you say; if she does not love me—and there 's very little in me for her to love—and if you can win her love, do it. Perhaps,' he added, with the first touch of bitterness in his tone, 'perhaps you have won it already.'

Vivian did not answer. He was taken aback by the suddenness of his victory. The doctor went slowly out of the room, but if Vivian could have seen his face he would have been startled, for it was ashy gray, like that of a man in deadly trouble.

Vivian went out, not to see Daisy, but across the old bridge, and away by the path up the river-side among the willows. 'He was very cool about it,' he thought. 'A thick-headed fellow like that doesn't feel things very acutely, I suppose. And now—how shall I play out the game? Make her

Digitized by Google

love me? Of course, that is easy enough. It is rather an exciting game to play, the winning her from him. I will do it.' And he turned homeward, and spent the evening in Daisy's drawing-room, while the doctor was miles away, galloping across the country to see a dying woman.

CHAPTER IV.

Mr Vivian was not a good man, but he was something of a gentleman. Not a gentleman in the highest and noblest sense of the word, for there are those who can trace their pedigree back to the time of William the Conqueror who have yet no true title to that grand old name. But he had certain ideas of honour, though those were not according to the highest standard; and though his conscience allowed him to use all means of winning Daisy's affections from the doctor, it revolted against doing so while he staid under the doctor's roof. He lingered there for a few more days of idle sauntering out into Daisy's garden, or down by the river-side; but before the third week of his visit had closed, he declared it to be necessary for him to return to London. The doctor did not press him to continue his visit. Since that one conversation, he had never mentioned Daisy's name to Vivian, and, indeed, had seen little of him, except when sitting down to the same table. It happened that there was a good deal of sickness during that long bright summer, both in Thornregis and in the surrounding country, and the doctor was more than usually busy. He used to come in, tired and dusty, from a long day's visiting and cantering over the breezy uplands, and through the deep woody lanes; and going across to Mr Barton's, would find Daisy seated in her shady arbour, where she could hear the perpetual murmur of the river, and smell the scents of her roses and stocks, listening to Vivian's musical voice as he read Tennyson's *Idylls* or Longfellow's *Golden Legend*. Or they would be in the drawing-room, where Vivian generally sat at the piano, talking by fits and starts, and every now and then letting his fingers wander over the keys in some low dreamy melody, or singing those wonderful thrilling notes of his, while Daisy listened in a sort of trance.

The doctor knew she was drifting away from him, and that he was powerless to bring her back. He felt, more than ever he had done before, the difference between her dreamy poetical girlhood and his practical middle age; and he doubted whether, even if he had the power, he would have had matters as they had been before. And yet he had never loved her more devotedly than now, when he seemed about to lose her. As yet he had spoken no word to her of any change in their lives; she was still his treasure, and he would not give her up till she compelled him to do so, by telling him that she could not be happy with him. And his manner had hardly altered towards her; there had always been in it more of grave, fatherly tenderness than of lover-like passion, and if she had cared to notice, she would have seen that he was even more gravely tender than of old.

At the end of a week, Vivian went back to London. 'You need not be surprised to see me back again,' he said to the doctor, who was too honest to say that he would be glad to see him, but confessed that he would not feel any surprise.

And in another month he did come back, taking up his quarters at the modest little hotel in the High Street, from which he could look across the Drew to the open country and blue sea-line behind. And all through hot July, and August, and September, and cool, brown-tinted October, he staid there, spending long days with his book and fishing-rod beside the Drew, and sending many baskets of silvery trout for Mr Barton's breakfast. He had come to be regarded as a familiar friend in the old gray house—one whose frequent and unceremonious comings and goings were to be looked for; and this easy, friendly footing was of all others the one which the doctor had most cause to dread. People said that the doctor looked graver and paler during that summer than he had ever done before; he worked harder, too, grudging no labour or sleepless nights, or long rides to visit patients who he knew could never pay him in this world, except by their blessings.

In autumn, Vivian again went to London for a few weeks, and when he came back to the quiet Thornregis hotel, it was close upon Christmas. He had made acquaintance with most of the little circle of village society, and on his return, he found an invitation waiting for him to a party at the Rectory on Christmas Eve. The Rectory was a great rambling house, standing nearly opposite Mr Barton's, behind a hedge of clipped box. Mr and Mrs Cornwall were easy-going, popular people, who did a great deal of good in their own quiet way, and were held in great respect and liking by all Thornregis. They had no children, and Mrs Cornwall had a motherly love for Daisy, so that Mr Vivian was sure of meeting her there, and was glad to accept the invitation.

Christmas Eve was a fine mild night; no snow had yet fallen, and there had been little hard frost, so the grass was yet green, and the chrysanthemums were still rich in purple and yellow blossoms. The party at the Rectory was a very pleasant one; all the young people available in Thornregis were there, and there was no lack of the soft, fair, girlish beauty which is our English pride. But it was evident that Daisy, in her floating white lace robes, and wreath of holly leaves and berries, was the queen; and Vivian's dark eyes lighted up with pride and admiration as he looked at her.

They had been playing games, such as old-fashioned people like to keep up on Christmas Eve, and Daisy had entered into them with almost childish gaiety. Vivian had rather hung back; he had an intense dislike of doing anything undignified; and after a noisy game at the 'Post,' he managed to get near enough to whisper: 'This room is getting so hot; do come out into the hall, and get cool.'

She smilingly agreed, and in another minute they were pacing up and down the wide old lobby together. The night was so mild that the front-door stood open, and they stepped out into the porch. Vivian snatched up a light shawl which some one had left lying in the hall, and put it round Daisy's shoulders.

'What a lovely night!' he said. 'Look how glorious Orion is.' He drew her out into the star-lit garden, where they could hear the gay voices and laughter from within, and they walked slowly across the broad gravel-walk, to where a drooping beech-tree formed a sort of natural arbour. It was bare and leafless now, but the night was so still, that, as they stood beneath its shelter, they felt no breath of wind. They looked at the stars, which

Digitized by Google

were singularly clear and brilliant, and tried to find out the constellations, and then between them fell one of those silences which are very dangerous to such a couple out together and alone on a starlight night. Daisy's little white gloved hand rested on Vivian's arm, and her face appeared ethereal in the dim light. Vivian looked at it, and determined to speak. 'Daisy,' he said suddenly, 'you are very beautiful.'

She gave him a startled look. 'Oh, please, hush!'

'Why? I have been silent long enough; I must speak now. You can't help knowing that I love you, Daisy.'

She drew her hand from his arm, and he saw, even by the starlight, that she grew paler. 'You must not speak to me so, Mr Vivian. If you love me, I am very sorry; yet I can hardly believe it possible, for you must have known all this time that I belonged to another.'

'You are right. I did know it.'

'Then, knowing that,' she said with quiet dignity, 'there should have been no words of this kind between you and me.'

She would have left him, but he caught her hand. 'Daisy, you must not leave me; you must hear me speak this once. Even knowing of your engagement, it was impossible that I should help loving you. How could I help seeing that you would be wasted on a man like him—one whose thoughts rise no higher than the ailments of country boors.'

'I will not hear this,' she cried, trying to get her hand away from him.

'You must hear it,' he answered passionately; 'you must hear the truth this once, and then, if you will, you can sacrifice yourself to him. You do not love him, Daisy—not as you might love me. Think how much older he is—how utterly different his whole sphere of thought and feeling. My darling, you would be miserable, tied to a man like that.'

Daisy leaned against the tree, and covered her eyes with her free hand. 'He is a very good man,' she said; 'the best man I have ever known.'

'Good!' he exclaimed scornfully. 'And what will his tame goodness do for you? Will it satisfy the cravings of your nature for deeper things than he knows of? Will it fill your heart and life enough to make you happy? Think what it will be to drag on year after year here, in this dreary place, for it is dreary, but for you. Think what it will be to have no change in your life, always the same monotonous round of faces, and things, and ideas. Think how you may become narrowed down to it yourself, and grow into something different from what you are now, my bright high-souled darling.'

Still she leaned there silently, keeping her eyes covered, listening to the voice of the tempter, but not yet carried away by it. Her instincts were higher than his, poet though he was; she had a dim idea that this goodness which he scorned was really the highest thing in the world; moreover, she knew right from wrong, which he did not.

'And I love you so,' he pleaded. 'What is his love to mine?'

'No; don't say that,' she said, uncovering her eyes, and looking at him. 'His love is the growth of many years; yours, of a single summer. He does love me; I know it.'

There was a pause: the voices and music from the Rectory came floating across the garden to them, sounding near, and yet strangely far away, they were so completely out of it all. Vivian was not the man to be too scrupulous about his assertions when he had a point to gain, so he said, after that minute's hesitation: 'I believe you are mistaken; I do not believe he loves you. If he had done so, he would not have been so ready to give you up.'

'What do you mean?'

'I mean that, when he told me some time ago of your engagement to him, he spoke in such a way as to make me understand that he was not very anxious about its being fulfilled.'

Daisy had been leaning against the stem of the beech-tree; now she drew herself up, proud and straight, and Vivian saw that her pride was touched. She looked away from him silently, at the lighted windows in front of them, and he could hardly understand the wistful look on her face. 'I can hardly understand that,' she said at last, speaking very low. 'He has always been so very kind to me. And, Mr Vivian, if he does love me, I will be true to him; I can be true in heart and soul, in spite of all you have said.'

'I do not believe he is true to you, in the way you mean.'

Unfortunately for Vivian, another person besides Daisy had heard the last sentence. The doctor had been detained by some patients from joining Mrs Cornwall's party till far on in the evening, and being a privileged person, whom no one expected to come at fixed hours like other people, he had as usual just come when he was able. The gate to the road had been left open, and on coming in he had heard the voices of Vivian and Daisy, without their hearing him. He felt angry with Vivian for keeping her standing out in the night-air, which, however mild, was apt to be treacherous in its effects, and acting promptly, as he was in the habit of doing, without giving much heed to what people might think of him or his doings, he crossed the grass sward to bring her in. His steps were not very audible on the turf, and he was close to the beech-tree before either of those under it were aware of his presence; and so it happened that he heard Vivian's words: 'I do not believe he is true to you.'

In another instant he was standing before them. 'What is he saying to you, Daisy?' he asked.

She came close to him, and laid both her clasped hands on his breast. 'Oh, doctor, he says that you don't care for me—that you would give me up.'

'The first of those assertions is untrue,' said the doctor, speaking quietly and sadly. 'As for the other, my little Daisy, I would rather see you happy than be happy myself. I fear I've been a selfish old fellow, thinking more of my own pleasure than of yours. I've been feeling more than ever lately the difference between us; I fear you would not be happy as my wife; I'm too old, too common-place for you.'

He nearly broke down; but he was so certain that she was glad to be free, that he tried to speak cheerfully. 'I daresay it was all a mistake, Daisy. Think of me as a foolish old fellow, nearly old enough to be your father, who dreamed in his folly that you might be something nearer to him than only a dear little friend. Forget about that foolish dream of mine, Daisy, and go and be happy with the man you love.'

She had never moved, but stood with her hands clasped on his breast, looking up eagerly into his

Digitized by Google

face. 'Say you don't love me, then,' she said. 'Say just once: "Daisy, I don't love you any more."'

He was silent, and she saw his lips tremble. 'Say it,' she urged. 'If it is true, you will say it.'

He put her gently away from him. 'I cannot,' he said hoarsely, 'for it is not true.' Without another word, he walked away from them towards the house; but half-way across the grass, he turned and came back. 'I meant to ask you,' he said, addressing Vivian for the first time, 'not to keep her longer out in the night-air. She is not very strong, and needs to be taken care of.'

Curiously enough, this little bit of care-taking, such as she had received from him ever since her fragile, motherless childhood, touched Daisy more than anything had ever done in her life before. Quite a new sensation, such as she had never before felt for the doctor, never at all for the fascinating young poet, stole into her heart, and made it thrill and tremble. She hardly knew what it was; she only thought, 'He could not say that he didn't love me;' and silently she put her little cold hand into his, and went back with him to the house, leaving Vivian to follow, a little sulkily, but by no means despairing. The notion of his taking the trouble of being the rival of a stupid village doctor, and failing, was not to be thought of.

In the drawing-room, dancing had begun; and when Daisy went and sat down in a corner of the sofa, away from both her lovers, Mrs Cornwall came and remonstrated with her for sitting still. 'I shall think you are not enjoying my little party,' said the good lady, 'if you sit moping there in a corner, when every one else is dancing.'

'But no one has asked me,' answered Daisy, trying to laugh; and then Vivian presented himself, with an imploring look, and she was obliged to dance with him.

'I know there is no use in asking you, doctor,' said Mrs Cornwall; 'we have long given up hopes of your ever becoming a dancing man.'

'No,' he answered, smiling a little sadly; 'I must be content to be one of the old people, and look on while the young ones are happy.'

He was watching Vivian and Daisy as he spoke, and his quick practical eye noticed that the skirts of her white lace dress fluttered perilously near the fireplace every time that they whirled past. 'Excuse me, Mrs Cornwall, but have you no guard that you could put before the fire? The ladies' dresses are in some peril, I think.'

Mrs Cornwall protested she had been very stupid not to think of it sooner, and went out of the room to look for one, while the doctor watched anxiously every time that Daisy swept past the fire. Some one called off his attention for a minute, and then he heard a cry. What he had been fearing had happened; Daisy's lace robe had been swept against the ribs of the grate—the dry, light material caught like tinder, and in less time than it takes to tell it, the flames had spread to the muslin petticoat beneath.

Vivian was not exactly a coward, but physical courage was not one of his strong points, and his first impulse, on discovering that the lady he was dancing with was in flames, was to let her go, and start back. I think that he would probably have recovered his presence of mind, and tried to save her, had time been given him; but before any other action was possible, the doctor had pulled from the sofa a gaily striped Affghan, and had wrapped it round Daisy, crushing out the flames with that and with his hands, regardless of the burns he received in the process. The room was all in confusion: some one pulled the cover off a table, pulling down the ornaments on the floor with a crash; and some were screaming for water, and running for Mrs Cornwall. She came, poor lady, crying and wringing her hands, and met the doctor carrying poor unconscious Daisy down-stairs.

'Oh, won't you bring her to my room?' sobbed Mrs Cornwall. 'There's a bed there, quite ready for her. Dear doctor, do let her stay here.'

But he shook his head. Her father's house was only a couple of hundred yards away, and he knew it would be better for her to be there. He carried her out into the starlit garden, from which he had led her in only half an hour before; and holding her as if she had been a baby, he bore her down the village street, and into her father's house; there he laid her on her own little, white-curtained bed, and proceeded to cut off the charred garments from her poor scorched limbs.

And for many weeks, he came and went, spending hours both of day and night in that darkened room, where Daisy moaned faintly in pain.

THE CHESTNUT WALK:

TRINITY COLLEGE, CAMBRIDGE.

LINGER, my spirit, in the chestnut walk,
If anywhere on earth thou lingerest;
The place is dear for no fond-hearted talk,
No college comrade, but for lonely rest.

There on the bench, within a spreading tent
Of chestnut foliage, have I reclined;
There in pure quiet hath my soul unbent,
And thoughts like summer airs refreshed my mind.

And there the beauty of 'the Rylstone Doe'
Before me passed, and fed me with delight;
And in my thoughts the poet's thoughts would blow
Like roses sweet and delicate and white.

The rippling light upon the leafy boughs
That hung in graceful fall above the stream;
The walk's soft shadow, growing, like repose
O'er a sweet face, the avenue's day-dream;

The bridge, where men have leaned, as youths, whose deeds
Make history sparkle, and whose clear pure thought
Is fresh as summer waves, or new-mown meads,
Though long ago they paced our cloister court;

The chapel bell, or music's distant voice,
Or white flocks bleating down the road beyond;
And many sights that made my eye rejoice,
And many sounds of which my ear is fond:

These things remain; though flitting, they remain,
Like forms upon the stream, most clear in calm;
Like hues in pearl, they live within the brain,
To perish only when that meets with harm.

No. 266. SATURDAY, JANUARY 30, 1869. PRICE 1½d.

POLAR ICE.

AMONG the navigators and scientific men of former times, it was disputed whether salt water was capable of being frozen. Experience—in many cases a stern teacher—has set that question at rest, proving that within the polar circles the sea is, for hundreds of miles, covered with masses of ice, which form a sullen, unyielding barrier to the poles. Maury describes the agencies at work in these terrible solitudes in a famous passage: 'There icebergs are framed and glaciers launched; there the tides have their cradle, the whales their nursery; there the winds complete their circuits, and the currents of the sea their round in the wonderful system of oceanic circulation; there the aurora is lighted up, and the trembling needle brought to rest; and there too, in the mazes of that mystic circle, terrestrial forces of occult power and of vast influence upon the well-being of man are continually at play. Within the arctic circle are the pole of the winds and the poles of cold; the pole of the earth and of the magnet. It is a circle of mysteries; and the desire to enter it—to explore its untrodden wastes and secret chambers, and to study its physical aspects—has grown into a longing.'

Marine ice is whitish, opaque, and rough on the surface, and consists of thin flakes of a porous spongy texture. From the quantity of strong brine enclosed in its substance, it is very heavy and dense, and projects only one-fifth above water. When sea-water begins to freeze, it partially deposits its salt, which, thus set free, retards the process of congelation below. Old floes are almost fresh, but a thaw renders them brackish. The polar seas do not congeal until the temperature falls to 28¼ degrees of Fahrenheit, which takes place in September in the north, and March in the south; though even in summer, a slight increase of cold is sufficient to form young ice several inches thick. The sun sets early in November, and the severity of the arctic winter begins in December, continuing to the end of January, during which time the thermometer ranges to about 40 degrees below zero. A week or two of milder weather comes on; but the middle of February brings with it the sun, immediately followed by the most intense cold of the whole winter. After that, the sun's influence begins to be felt, and in July, the ice breaks up. During the three summer months, the sun never sets, but noon and midnight are equally illumined by brilliant sunshine. A few stars appear in September. The darkest part of winter is from the middle of December to the middle of January, when the aurora transforms the sky into a vault of fire, and paraselenæ appear, surrounding the moon with blazing crosses, circles, and mock-moons, scarcely surpassed by the wonderful deceptions of the solar rays. The intense cold of February is accompanied by considerable twilight; and in the latitude of Banks's Land, there is even at the end of January tolerable light from 9.30 A.M. to 2.30 P.M., so much so, that at noon Arcturus is the sole star unquenched by the increasing daylight. The only navigable time is from July to September within the northern, and January, February, and part of March within the southern circle. During the rest of the year, the arctic regions are impenetrably sealed by vast fields of ice, both 'floe' and 'pack,' covering every foot of water, from the shallowest inlet to the wide expanse of Baffin's Bay or Melville Sound.

Floes are often several miles in diameter, and fields stretch away out of sight from the mast-head; while the great pack of Baffin's Bay extends for hundreds of square miles, unbroken by a single crack shewing blue water. Bay or young ice forms most rapidly near land, where the water is shallow and soon cooled throughout its depth; hence the name. The small round discs called pancake ice result from the soft crystals formed by frost when it first grasps the surface of ruffled water, or, as some say, from snow falling into the sea without thawing; the motion of the waves in both cases driving the loose mass into these shapes. They next unite into a continuous sheet, increasing in thickness with increasing cold till it becomes floe, from two to seven feet thick in summer, and fifteen or even

Digitized by Google

twenty feet in winter. This is often broken up by the joint action of wind and tide; and when the huge fragments are piled into hummocks sometimes fifty feet high, and of the most fantastic shapes, whirled and jammed together by these unseen forces, and again firmly cemented by frost, the whole is called a pack. The edge of a heavy pack always consists of old hummocks of the largest size wedged together. In summer, these break up in small holes of water connected by narrow lanes, with occasional openings in the edge of the pack. A peculiar groaning, which arises from the pressure to which the floe is subjected, announces the approaching 'nip.' The ice 'buckles,' that is, rises in an arch, and crashes over, piling the fractured pieces along the line of disruption with a sharp shrieking sound. This is caused chiefly by the force of tides or of a ground-swell. When the wind brings two floes into collision, the effect is similar at the moment of contact, except where one is very heavy, in which case it underruns the other. Woe to the unfortunate whaling-vessel that lies between two opposing floes when a nip is inevitable, giving her no time to saw a temporary dock in the ice! She is forced up and thrown on her beam-ends, or crushed to pieces; or worse, if she be deeply laden, the ice may rise up and overwhelm her altogether.* Sometimes a nip comes almost noiselessly, with scarcely any groaning, and turns up great masses with 'quiet but appalling grandeur.' There is a strong swell, and the colour of the water changes on approaching a great body of ice. The clouds also assume a deceptive appearance of land. A comparative calm prevails throughout the arctic regions, in strong contrast to the antarctic seas. The wind is rarely above a force of five, though in some parts storms are frequent.

Scoresby gives thirteen feet as the average depth of a winter floe, but this varies greatly. In Kennedy Channel, Dr Hayes met with broken pieces four times that thickness. This is thawed to a depth of perhaps four feet by the sun, and the action of the waves also reduces it considerably. Narrow channels and bays are soon cleared, but the main body of the ice *never* dissolves. Through the one long summer day it floats, driven hither and thither at the caprice of wind or wave; and, whether encircling the land like a white girdle, or lying far out at sea, scarcely distinguishable on the horizon but for the spray flashing in the sunshine, as it beats on the windward edge of the ice, it remains changeful yet steadfast, unyielding till the winter frosts creep on, and its bright enemy sinks in death-like cold. Every winter, the great barrier puts forth two tongues of ice from Melville and Smith Sounds. They drift southward, and unite to form the great pack or 'middle ice' of Baffin's Bay, which goes rolling on through the wild dark night to its dissolution in the open ocean. It is in motion from December to May, and by July is floated out sufficiently to enable the whalers to cross the 'north water' from Melville Bay to Lancaster Sound. The old *Resolute* was drifted alone in the pack a distance of fifteen hundred miles without a scratch on her rusty sides; and the steamer *Fox*, after being beset in the north water, drifted during the whole winter back to Cape Farewell, with the same icy landscape around her when she finally broke out as when she commenced her unwilling backward voyage. Once let a vessel get entangled in the pack, and she is fast for the season, if not indeed for the winter.

Ice-blink, or the light on the horizon reflected from snow or ice, varies in tint; over field-ice, it is a very pale, clear yellow; over pack-ice, pure white. The blink of young ice has a slightly grayish tint, and that indicating snow on land is a deep yellow. In the antarctic regions, the latter is paler than in the north. Besides these, a peculiar darkness on the horizon, called a water-sky, is a sure herald of open water in the direction to which it points. Frost-smoke is merely steam from the sea, produced by its contact with the colder air.

The levels called 'tidal terraces' are usually supposed to have been caused by geological changes in the gradual upheaval of the coast during long successive ages. Belcher's theory is that they are produced by bay-ice, under strong pressure, being forced up the beach, grazing its surface until the motive-power is arrested. This may happen several times, each successive sheet sliding over and beyond the last, and the whole freezing into one mass. Naturally, when it is afterwards broken off or thawed in summer, it leaves the impress of its bed on the gravelly slopes in a tidal terrace.

The interior of Greenland is occupied by vast glaciers, which encroach on the coast, filling the deep dark fiords with frozen snow. As summer advances, those portions of the glacier that project into the sea are undermined by the waves, and fall with tremendous noise, rocking in the foaming water till they gain equilibrium, when, perfect icebergs, they float here and there, impelled by winds and currents. Many are borne by the polar current southward. They meet the warm waters of the Gulf-stream in latitude 50 degrees, where they melt, and deposit the loads of earth and stones borrowed from the Greenland soil. According to Maury, this has probably, in course of time, formed the Grand Bank of Newfoundland. They are in incredible numbers. As many as five hundred have been counted in sight together, ranging from fifty to three hundred feet in height, and of all sizes up to a mile in extent. Their appearance is very beautiful and no less extraordinary. Gothic churches, Egyptian temples, aërial palaces with pillars and arched windows festooned with crystal draperies, are only some of the inconceivable varieties of form displayed, while they gleam under the summer sun like mountains of burnished silver, with pinnacles and cliffs of clear sapphire or the palest green, from which rush cataracts of limpid water mingled with fragments of ice. These various hues arise from several causes. Bergs are originally composed of fresh-water ice of different ages, but that formed from salt water frequently overlays it in parts. A great deal of snow lies on their summits, and forms large ponds of fresh water, when dissolved by the heat of the sun. Finally, the solar rays touch the bergs with colours changing with the position of the spectator. Only one-eighth of their total thickness is seen above water. Frequently bergs capsize in consequence of the sea undermining their base. An ominous rolling motion gives notice of this event; it continues for some time, and at last the berg heels over and disappears with a terrific plunge, sending

* 'Wherever the wind can act on water, and the tide-ripple obtain play it will break up the heaviest floe.'—*Belcher.*

up columns of spray. It reappears bottom upwards, balances itself, and floats quietly on with a changed face.

All the antarctic land yet discovered consists of gigantic cliffs without a single opening, three thousand feet high in some places, descending in others to one hundred feet. The whole is faced with ice of enormous thickness, and covered with snow, so that at a glance the eye can scarcely imagine it to be land at all, but for spots shewing the dark stone where the cliff is too perpendicular to admit of even ice maintaining its hold. Nothing is so tenacious as the cold of the antarctic regions. In February, the warmest summer month of 1841, the thermometer never rose above 14 degrees at noon near the continent. It is rarely above 30 degrees in the sun at mid-day during summer, and falls in winter more than 50 degrees below zero. The sun stays a week longer north of the equator than it does south, making the winter and night of the antarctic regions longer. South Georgia, in a latitude corresponding with that of Yorkshire in the northern hemisphere, is always covered with frozen snow, and produces scarcely anything but mosses and lichens. The immense preponderance of water south of latitude 50 degrees, allows the fierce westerly winds to blow round and round the world, a perpetual cyclone, keeping the sea in constant agitation. Hence it is but natural that pack-ice should prevail. A single level floe-piece is rarely more than a quarter of a mile in circumference, so broken and pressed together is the ice by the fury of the waves, which beat heavily against the pack-edge. To leeward it is smoother, and a calm opens the pack in all directions. Exploring expeditions have had no need to winter *here*. They cruised about during the summer months, January and February, and returned in March through a yet open sea; therefore little is known of these regions in winter. Even in summer the cold is so intense that everything wetted freezes instantly; and the progress of vessels would be seriously impeded by the accumulation of ice on their bows and lower rigging, if it were not chopped off every day with axes. On one occasion, when the crew of the *Erebus*, Sir James Ross's ship, were performing this duty, they found a fish six inches long firmly embedded in the ice. It must have been dashed against the side and instantaneously frozen in. The temperature being scarcely ever above the freezing-point, ice seldom melts, and the constant damp and precipitation in one form or another increase it. Bergs have little variety of form, unlike those of the far north. A freshly formed antarctic iceberg is stratified, flat-topped, and perfectly wall-sided, varying from one hundred to six hundred feet in height, and reaching sometimes an extent of six square miles. In different stages of decay, they take curious shapes, which relieve the monotony of the usual enormous square blocks of ice. Large fragments constantly fall from them, forming a stream of heavy pieces to leeward. Wilkes believes that their formation in strata may be owing to the berg having been originally a piece of drift-ice, upon which successive layers of snow, rain, and fog have frozen. The sea being nearly always of the same temperature, they do not melt, but float for a long time, perpetually added to by the moisture. If, as is probably the case, they fall from the cliffs, their form may be accounted for by the perpendicular, angular character of that tremendous barrier. A difference of temperature between sea and air occasions cracks in the ice. A sudden change in the arctic regions during winter causes great fissures many miles in extent, diverging to every point of the compass, and attended by loud explosions, similar to those unexplained noises called by seamen 'bolts cracking.' These last must be produced by submarine movements of the ice, for they take place without the smallest apparent motion; and, as Belcher justly says, a vessel would drop to pieces before the winter was half over if her bolts snapped at the rate at which these sounds are heard. In winter, the air of the antarctic regions is probably 40 or 50 degrees below zero, and the sea 28 degrees above—a difference which causes large masses to break off the cliffs of ice, to be drifted by the south-westerly winds to warmer latitudes, there to melt.

Brash or powdered ice, of a brownish yellow colour, was found near land by exploring parties. Melted and poured through blotting-paper, it left a thin sediment, from which, when dried, a very fine powder was obtained. Analysis proved this to be minute animalcula, probably the colouring matter in all stained ice and snow, not excepting the much discussed red snow seen by Ross and others on the Crimson Cliffs of Beverley.

Sometimes the tops of bergs are crowned with a cloud of white mist, occasionally so dense as to envelop it altogether. There the process of evaporation is busily going on. Every particle of air above those seas is heavily charged with moisture.

From this it will appear that the two polar circles differ greatly in physical conditions. The antarctic has a marine climate, that is to say, it is equable. Though wet and stormy, it is not subject to extremes of temperature, and it is believed that the south pole must be warmer than the north in winter. Arctic sunshine raises the thermometer to 66 degrees or 70 degrees, and hung in the shade immediately after, the mercury falls to the freezing-point. The arctic climate is continental—dry, calm, and variable. The thermometer has a range of about 120 degrees; and while the round of the seasons brings but little change in the frightful antarctic wastes, nothing can surpass the beauty of the arctic summer—'an endless blaze of light, the air and sea and earth teeming with life,' plains glowing with richly tinted flowers, and strange, glittering forms sailing past 'in stately and solemn procession.' Its currents are strong, and bear large numbers of bergs to meet the warm Gulf-water, and, as it is natural to suppose, bergs are found to be most numerous where the drift is strongest. The antarctic seas are in direct opposition to this. Not only are its currents sluggish and feeble, but the most powerful of them, Humboldt's Current, carries few bergs along the Chilian coast, while the main ice-drift is towards the Falklands on one side, and the Cape of Good Hope on the other, where there is scarcely any motion of the water. This is a fact which no navigators are able to explain, except perhaps on the supposition that there may be strong submarine currents at a great depth below the surface. Bergs have been observed in Baffin's Bay drifting rapidly to the north, when there was a powerful surface-current running against them, shewing that in consequence of their weight and immense draught of water (in some instances more than a thousand feet), they must be influenced by some 'resistless undertow' yet stronger.

Unfortunately, all our knowledge of the poles of the earth is confined to scientific guessing. The north magnetic pole in Boothia is known; so are the poles of winter cold, one of which lies near Yakutsk in Siberia, and the other not far from Wellington Channel. The poles of summer cold are not so well established. From various testimony, it is all but certain that the true north pole is warmer than is currently believed. Dr Kane discovered beyond Smith Sound a perfectly open sea with tides ebbing and flowing, and shores abounding in animals and birds. Captain Penny sailed upon a similar open sea. The ice-field which baffled Parry's heroic effort to reach the north pole in 1827 was travelling southward, borne by a current like that of Baffin's Bay, and must have left open water in the latitude from which it started, at most only five degrees from the pole. No bergs are met with in the seas of Northumberland Sound, but immense hummocks, which might sometimes deceive a careless eye. Ice is frequently piled on the western side of Queen's Channel, apparently from tidal motion. After a nip, the piled fragments grind each other to powder, and involve all in a smooth coating of brash-ice resembling a small berg. This adds to the evidence regarding tides in the polar sea, and, as some think, proves the non-existence of land there; for, as it is a maxim that wherever icebergs are found, land to produce glaciers cannot be far off, it is argued that the reverse holds good. Others believe, on the same principle, that as bergs are met with in Kennedy Channel as far north as it has been traced, Greenland must extend to an infinite distance, and might possibly afford tolerable sledging the whole way to the pole. It may be that the tidal wave comes in from the Atlantic round the northern end of Greenland, it may be that it is generated at the pole itself; that these questions are no nearer decision than they were ten years ago, is to be regretted. Another material point of evidence remains. Immense numbers of birds, including water-fowl, migrate *northward* in winter from the heart of the frozen seas. Reason asks why this is, if they do not expect, with their unerring instinct, to find a warmer climate and an open sea. Long before the North-west Passage was discovered, the whalers asserted that it must exist, because whales, that cannot pass the tropics, had been met with in Behring's Strait, wounded by harpoons that were stamped with the private mark of Atlantic whaling-vessels. Experiment has proved the correctness of their assertion; *that* problem is solved, and the poles may one day yield up to us their deepest secrets.

A PERFECT TREASURE.

CHAPTER IX.—MRS BLUNT SEES HALF THROUGH THE MILLSTONE.

It was customary with Rosa Glendell, as I came in time to learn, to say as wise and true things in jest as most people can compass in earnest. She had indeed described my dear uncle's characteristic when she called him 'impracticable' as a patient. She was also a girl of her word. She had undertaken to nurse him without his knowing it, and she went through with that. Of course, Mr Glendell took an early opportunity of bringing her with him to 'the Point,' and she made conquest of the ex-maharajah on the spot. This result astonished nobody but herself; but it was the most complete success imaginable. My uncle was actually induced, because her lovely hands had brewed it, to take a cup of tea—a beverage I had never seen him touch; and he pronounced it admirable; nay, he was even heard to murmur something about the sugar being unnecessary, during the delivery of which sentence he blushed profusely. We never had so merry an evening in our little home before. The host exerted himself to amuse his youthful guest in the most unwonted manner; everything he possessed that was rare and curious was taken from its repository, and received its appropriate history. The cause of this was, in the first place, the admiration which my uncle entertained of Rosa's character: the efforts she had made to support herself; her self-denial and self-exile—all which he had heard from her father's lips. But it was impossible for him to resist her personal attraction. When she left us that night, it seemed that the house had lost something much more than a beautiful ornament. 'The presence of that excellent girl, Marmy, positively does one good,' said my uncle between the puffs of his cheroot.

So Rosa came to our house to teach me French, instead of my going to Mr Glendell's. By the end of the week, I shewed her the portrait of the Begum, and assured her that she had effectually erased the memory of that interesting female in the ex-maharajah's heart.

The surgeon expressed a hope that his daughter would bear herself meekly, if chosen to succeed so eminent a personage, and not be supercilious to her nephew by marriage.

As to my uncle, he openly expressed his regret that a man might not marry his grand-daughter. He submitted to this charming creature's dictation without resistance, and from her hand would take anything that was good for him. Always kindly and good-humoured, he was now become quite jocose and sprightly. Mr Glendell seemed to grow younger daily from the time his daughter returned home. As for me, I dwelt in the seventh heaven, only descending from it to write my novel, which I wished, above all things, to make worthy of the approbation I knew would be bestowed upon it by this new critic, so much easier to please than the literary veteran at Seaview Cottage.

Those were happy, happy days.

The only person in our household, and, indeed, in the village itself, who did not seem to be touched by the wand of this good fairy, and altered for the better, was Sangaree Tannajee. He ought to have been at least grateful to this young girl, who took all trouble off his hands, as respected his sick master's needs, and smiled even on himself—for she was like the sun, that smiles upon the unjust as well as on the just—but he only scowled upon her as he did upon everybody else. He was jealous of her influence with my uncle, notwithstanding that he himself never strove to gain any: and doubtless he disliked her for liking me. Insolent as he was, however, he did not venture openly to shew this. He was not deficient in cunning; and perhaps he felt that any impertinence to Miss Glendell would be the one thing that my uncle would not pass over.

Rosa and I were very diligent as teacher and pupil, and again as pupil and teacher. I hardly know which I enjoyed most, the learning or the teaching; the listening to her soft clear tones making music of a strange tongue, or the reciting

Digitized by Google

to her the melodies of Keats, and Shelley, and Coleridge—my favourite poets, and whom I wished her to love as I did.

When she was not by my side, I worked hard, but not hurriedly, at my novel. It was not worth much, of course, but it was at least twice as good, thanks to Mrs Blunt's advice, as my last crude attempt at fiction.

At the end of six months, I took what I had written to Seaview Cottage; and, in a few days, repaired thither again for judgment.

I was by no means so nervous this time as when I was edited before. I was conscious of improvement; and, besides, there was nothing to be decided upon on this occasion as regarded my future calling.

'There is one thing, Marmy, that has interested me greatly in your novel,' was the old lady's first remark.

'My dear Mrs Blunt,' said I, reddening to the ear-tips, 'I am delighted to hear it. What is it?'

'Well, Marmy, I take a lively interest in young people's "goings-on," as we say at Sandiford; and your novel has convinced me that you are in love.'

I blushed from head to heel.

'It's perfectly charming,' continued the old lady, 'and just as it should be—your united ages being *thirty-five*, and neither of you having a shilling to call your own.'

'I could not help it, madam,' pleaded I, with simplicity.

'Of course not. You would have been a heartless young wretch, only fit to make money, if you had failed to fall in love with Rosa Glendell. But still, you have not begun to think of marriage, have you?'

Notwithstanding her good-natured banter, I saw there was something serious in my kind critic's mind.

'No, indeed, madam: it would be very foolish to do so, for the reasons that you have named. I will not attempt to hide from you—although I did not know that I had revealed it in my story—that I do love Rosa with all my heart. I would die to save her little finger from hurt; I worship the very'——

'Yes, yes; that's all *here*, my dear,' said the old lady, pointing to the tell-tale pages. 'But have you told her so?'

'We have promised never, never to marry anybody except each other,' murmured I bashfully.

'And your uncle and her father, do they know of this eternal compact?'

'No, madam.'

'My poor boy,' said the old lady tenderly, laying her still plump hand upon my shoulder, 'you are dreaming, you two—you are not living in this world at all. I have lived there more than seventy years, and know how things really turn out. Rosa Glendell, who is a most charming girl, and has had a first-rate education in Paris, will presently marry a most respectable banker, a widower of about fifty-six.'

'What banker, madam?' exclaimed I indignantly. 'I am sure that if Mr Glendell has any such intention of disposing of his daughter's hand, she will never obey him.'

'You wish her to wait for you, then, Marmy—to wait, and wait, until, perhaps, her beautiful black hair turns gray, and she is no longer worth waiting for?'

'Madam,' cried I, 'I will not listen to such words. Why do you insult me thus? I have won her love: I hope to prove myself worthy of it. I will work—God help me—like ten men, to earn a living for us both; and she is not a mere child of fashion, to whom every luxury is a necessary; she is a brave good girl—the bravest, best in England.—And please, madam, I will take my manuscript away, and not trouble you.' I never was so angry with any one in my life, not even with Sambo, and I am afraid I made a snatch at the parcel.

'Nay, sir,' said the old lady, holding up a reproving finger; 'you should not treat me so indeed. If I have the misfortune to be obliged to write for my living, I am a gentlewoman still.'

'I had not forgotten that indeed,' said I, humbled to the very dust, 'but only that I was myself a gentleman. Forget it, and forgive me, my dear madam. I am behaving like a brute, but indeed I scarcely know what I do. To hear that my sweet Rosa is to marry a banker, who is a widower of fifty-six—it makes me mad to think of it!'

'My good Marmy,' said the old lady soothingly, 'there is no particular banker in the case, I do assure you; I was merely casting Rosa's horoscope. From my experience of life, I judged that such a thing was likely to happen—that's all. Everything does turn out so exactly the reverse of what Youth pictures to itself. You must not be angry with me for reasoning from analogy, instead of being transported by your passion. I am not (as I said) at all surprised at your falling in love with Rosa, nor, I may add, you very nice boy (only you are not so good-tempered as I thought you were), at her reciprocating your attachment. But I don't like these serious promises of marriage between young folks who are poor; a long engagement of this sort generally ends in the self-sacrifice of the girl. In this case, here is a penniless lad, upon the threshold of the most uncertain profession in the world, exacting a promise—well, at all events, interchanging promises of eternal fidelity with one whose chief attraction, beauty, will fade in course of time—whose value in the matrimonial market, to speak the bare truth, will be depreciated with every year. I say you have no right to call upon her to nullify her own natural advantages, to destroy her chance in life for such a far-off contingency as you can offer. In short, Marmy, you are acting very selfishly in this matter, although I am sure you were unaware of it. You see what I mean now, don't you?'

'Indeed, I do, madam,' sighed I; 'and my duty is plain enough. I will release Rosa at once from her engagement. I am very much obliged to you for pointing out what ought to be done, Mrs Blunt; and you have broken my heart in doing it.'

How strange it seems, looking back on that scene now, through the many intervening years, that I should have been obliged to hide my face in my hands, lest that old woman should see my tears; but I did cry like a child. I had such confidence, you see, in my mentor's sagacity and wisdom, that I felt things must all turn out as she foretold, and that I and Rosa were never to be man and wife.

And ah! how I loved that girl!

Then, when I looked up at last with as cheerful a face as I could compass, I saw Mrs Eleanor Blunt was crying also. 'Don't cry, Marmy,' said she; 'that's very foolish: it is time for tears when everything else fails.'

Digitized by Google

'Everything has failed, or will fail,' murmured I gloomily. 'You have told me so yourself.'

'No, Marmy; I have not said that. You may release Rosa from her promise, and yet marry her, if things turn out well! You have two strings to your bow, yet, remember. In the first place, there is this book of yours—a most creditable performance for so very young an author. You have improved in your style, my dear, immensely.'

I shook my head: my case was past receiving comfort from 'improvement of style.'

'Now, if this novel has even a very moderate success, Marmy,' continued the old lady cheerfully, 'it may place you at once in a position to earn your own living. It will then become only a question of time for you to earn enough for two. Supposing it to be finished, and to extend over three volumes of print, then the question will be, how to get it brought out. Do you think the ex-maharajah could spare a hundred pounds or so, to get it published on your own account?'

'I am quite sure he could not, Mrs Blunt: we are growing poor up at "the Point" yonder; I can see that, although my uncle would conceal the fact. I would not ask him for a penny.'

'First books are sometimes published by subscription,' remarked the old lady thoughtfully. 'Now, how would that be?'

'Well, madam, my uncle would subscribe; and perhaps Mr Glendell; and then, since you are so kind, there would be a chance of one more. Besides those,' added I bitterly, 'I don't know of anybody else that would be'——

'Fool enough,' ejaculated Mrs Blunt, completing my unfinished sentence. 'An edition of three!' Her plump shoulders began to 'wobble,' and her eyes to twinkle with suppressed mirth.

For my part, I was intensely grave. 'I should not like publishing by subscription,' said I, 'in any case. Nothing but rubbish comes out in that way.'

'I won't say that, my dear, because my own first book was published by subscription,' observed the old lady. 'But you are quite right in the main. I have found cause to repent of it myself. Everybody who put down his guinea on that occasion, of course made me his debtor, and some of them have taken out the obligation since in patronage of a most unpleasant sort. There is a master-butcher who sometimes reminds me to this day that but for his one-pound-one, laid down half a century ago, nobody would ever have heard of Eleanor Blunt. That is what one may call exacting compound interest, which the law holds to be usurious, even when one raises money on one's expectations. Drat the man!'

The picture of this master-butcher (perhaps in blue) introducing Mrs Blunt into the Temple of Fame upset even my gravity.

'There are lots more,' continued she comically, 'of the same sort, only not quite so bad. Most of my original patrons are gone where there is nobody (I hope) to patronise; but some of their offspring or executors have not given up their lien upon my reputation yet. A few of those are, moreover, in such bad circumstances, that I have paid all the money twice over in hard cash. Yes, you are certainly right, Marmy, not to bring out your novel by subscription.'

'But how is it to be brought out, Mrs Blunt?'

'Well, it must take its chance in "the Row," Marmy.'

I thought she meant in 'the battle of the books,' in the mêlée of novels, all struggling for acceptance with the public, so I said: 'Of course it must; but how is it to be got there?'

'You foolish boy, I mean it must go to the booksellers' — must find a publisher for itself. Fortunately for you, my own mishap with those gentry—five of whom missed a fortune by rejecting me—has made the road to publication smoother than it was. Sooner or later, this manuscript is sure to be in print, Marmy; I will promise you that; though, in my opinion, the later it happens the better.'

This was but cold comfort, after all the depressing things with which Mrs Blunt had treated me during this interview; and I did not feel so grateful for it as perhaps I ought to have done.

'You said there was another string to my bow, madam—may I ask to what you were referring?'

'Well, that is a subject, Marmy,' answered she hesitatingly, 'upon which you have shewn some unwillingness to enter. But it is my earnest hope that your trump-card may turn out to be something apart from literature altogether. I have been thinking a good deal of that conversation we had together, six months ago, concerning—I won't say the secret between your uncle and his servant, since you wish to respect it, but concerning those future expectations of which Mr Braydon hinted. It is now plain to me from his expression: "I may be rich, and you almost certainly will be," that everything hinges upon the question of survivorship. If somebody or other dies before your uncle, the ex-maharajah will come into the property; and if your uncle dies, and you survive this said person, you will reap the same benefit. Mr Braydon being so much your senior, has, of course, a less prospect of inheritance than yourself, which fully accounts for his observation. Again, by the way in which he speaks of that prospect—for he *may* be a rich man, he says—it seems to me that he has about an equal chance of survivorship with this unknown person.'

'I think you are right,' cried I suddenly. 'I remember now to have seen my uncle more than once poring over a little book all composed of figures, and which I think was called the *Tables of Annuity;* but, to my knowledge, he has not done so for these many months.'

'Just so, my dear; that is because he feels himself far from well, poor fellow. His chance is no more as it used to be, a matter of simple calculation.—Now, how old is this Sangaree Tannajee? His looks are not much of a guide; but allowing for the effects of opium and a bad temper, I should judge him to be about his master's age.'

'I have heard my uncle say that Tannajee is by two years his senior.'

'Just what I expected, Marmy,' chuckled the old lady triumphantly. 'The master, then, until within these six months, had a slight advantage over the man. You may depend upon it that somehow or other—else why did your uncle say, when he saved his life, that he had resisted a great temptation?—that unpleasant Hindu, valueless as he appears to himself and to everybody else, stands between you and a great fortune.'

'Then what is it you recommend me to do, madam? To put him to death?'

'No, Marmy; because, although very nice, that would be dangerous and wrong. I advise you, for the present to stick to literature. But have your

Digitized by Google

eyes wide open—not to spy upon your uncle—I am the last person to propose such a thing as that, I hope—but to keep a very sharp look-out on Sangaree Tannajee.'

'But what can he, personally at least, have to do with wealth of any sort, my dear madam?'

'I don't know, my dear; I only know your uncle took very great pains indeed to prevent his running away from you; and it's my belief that your hope of winning Rosa Glendell lies not so much in the success of this novel, as in retaining that Hindu vagabond's services *for life*.'

CHAPTER X.—I BRING THE HINDU TO REASON.

As the summer advanced, my uncle seemed to improve in health, and thereby supplied the one thing that was lacking to the happiness of our little household, in which—since they were so often with us—I include Mr Glendell and Rosa. But his spirits did not rise proportionably; they were very variable—almost always good when our pleasant neighbours were with us, but flagging, although he strove his best to keep them up, when we were alone. In the solitude of his own room, I had good reason to fear that they broke down altogether. His complaint still tormented him at night, for I often heard his hard dry cough for a whole hour together; and sometimes (though seldom now) he would get up and sit in a chair, for greater ease of breathing. From this, since I call him 'better,' it may be judged how very ill he had been; but the doctor expressed himself of good hope that his patient had 'turned the corner,' and would be tolerably strong before the ensuing winter. It would have been desirable for my uncle to have sought during that season a home less exposed to wind and storms than Hershell Point; but we all knew that it was useless to attempt to persuade him to do so. Like most men at an advanced age who have no domestic ties, which make a home wherever we carry them, he clung tenaciously to his own place.

Rosa, as before, could do anything with him short of getting him away; but he was as disinclined to be ministered to by any one else as ever. Often and often I have got up, hearing him in pain and trouble, and gone no further than the door of his room, where I have waited for an hour without going in, so well I knew that such an evidence of solicitude upon his account would distress him. But upon one occasion about this time, I experienced a novel cause of alarm. I had not heard my uncle cough at all that night, which I ascribed to my having slept more heavily than usual after a long day's walk; but I was awakened by hearing him move about in the study. The moon was shining at intervals through clouds, and I saw by my watch that it was about two o'clock in the morning. The house, of course, was profoundly still, or the noise of his slippered, or, as it seemed, naked feet could not have reached my ears. It would not have aroused me of itself, but a chair, or something he had probably stumbled over in the dark, had fallen.

I had never known him go into that room, which lay on the other side of mine from his own, at night before. There was some brandy there, of which perhaps he was in search; but if so, he must be much more unwell than usual. I slipped out of bed, and softly approached the study-door, which stood ajar. The name of this apartment, as has been hinted, was a misnomer, for it did not boast of half-a-dozen books, and even the desk had very rarely any ink in it. There was a cupboard, in which were kept the brandy and my uncle's cheroots; and the turning-lathe and a few chairs were all the furniture. It was not even entirely carpeted, the spaces next the wall being quite bare. If they had not been so, I should not have heard the footsteps at all. I could now hear nothing, and the moon was hid, so that I could see nothing, as I watched and waited in the dark passage. Presently, however, I heard a click, which I recognised at once; the desk made that noise whenever it was opened, which was often enough, for my uncle kept all his housekeeping money there, and, characteristically enough, not under lock and key. There was the sealed packet there also, but nothing else. What could my uncle possibly want at such an hour out of his desk? The idea of a burglar never entered into my mind; such a being at Hershell Point was more rare than the dinornis: he was only not extinct because he had never existed. I heard the muffled chink of money, as if it was being counted coin by coin, and I noticed there were fewer than usual kept in the desk. A fidgety man, who fancied he had made some mistake in his domestic calculations, might perhaps have risen even in the night to assure himself respecting them; but my uncle was not fidgety. There was now another noise, which I had only once heard before; the secret spring had been touched, and the drawer containing the packet rattled out. At this moment, the clouds cleared away from the moon, and I saw a figure standing against the window with something in his hand. I have no recollection of doing so, but perhaps I gave an involuntary start. In an instant the figure turned, and I fled swiftly and noiselessly to my own chamber, though not so fast but that ere I entered it my ear caught once more the snap of the spring and the click of the desk. Directly afterwards a door was softly shut, and I heard my uncle's short dry cough on the other side of my room.

I would not have had him find me thus spying on his actions for ten times the gold in his desk, and I lay for a minute or two with beating heart, and scarcely venturing to breathe. But presently I began to consider, was it possible for such an invalid to have left the study and reached his chamber within that short space? The partition between our rooms was thin, and yet I had not heard the bedstead creak, as it was wont to do when it received the weight of the still stalwart ex-maharajah. Perhaps it was not my uncle at all who had visited the study. Who then could it have been? Who else had any right to count the money in the desk? or, supposing that had been done with some dishonest motive, who could possibly have any concern with the packet except one person, Sangaree Tannajee? I slept no more that night, but listened for every sound. If the Hindu's door had opened again, he would have found me armed—for my uncle had recently given me a pair of ancient pistols, beautifully inlaid, with which I practised shooting daily—and resolute to prevent his leaving the house. But all was still. What strengthened my suspicion that he might have premeditated some abominable *coup*, such as robbery and flight, was the fact that he had kept himself sober the preceding evening.

At breakfast, in answer to my inquiry, my

Digitized by Google

uncle informed me that he had passed a particularly quiet night, his cough having scarcely harassed him at all.

'Then you did not rise and go into the study for brandy?' said I as carelessly as I could. 'I certainly thought I heard you, and was afraid you were unwell.'

'Certainly not, Marmy. You are too anxious about me,' said he, with a little annoyance in his manner. 'I felt greatly better last night; and so far from running about the house, I scarcely even turned on my pillow. You must have been dreaming.'

My uncle was incapable of dissimulation, far less of a lie. I knew therefore at once whose figure it was that I had seen standing at the study-window; the only question was, should I reveal what I had seen? I decided to consult Mr Glendell upon this point, and I did so. The surgeon was aware of all that I knew myself respecting the mysterious connection of the Hindu with my uncle's fortunes, but he was not so curious about it as Mrs Eleanor Blunt was. Doctors, generally speaking, know too much of the secrets of their fellow-creatures to be greatly interested in such matters; and they are honourably discreet about what they know. With the exception of his jocose allusion to the skeleton in our household, he had never pressed me upon the matter, and for that very reason I had been the more induced, when I came to know him intimately, to repose in him my whole confidence. He had not been communicative of his ideas upon the subject; but when I told him what Mrs Blunt had said regarding it, he had nodded acquiescence in her views, and remarked drily that 'that old lady ought to have been a Bobby'—by which I understood him to mean a detective policeman.

He congratulated me on my good sense in having concealed what I had witnessed on the night in question from my uncle.

'Half his disease, my dear Marmy,' said he, 'is attributable to worry, anxiety of mind, and that's why Rosa and I make a home of your house: the more he is won from the solitude of his own thoughts, the better; bad news, in particular, should be studiously kept from him; and what you now tell me is *very* bad news. It is clear to me, that if there had been more shots in the locker, more money in the till, that whity-brown scoundrel would have bolted with it last night. What he wanted with the packet, I can't tell. Perhaps, having decided not to decamp, he only wished to assure himself that it was there. That he knows it contains something of importance, I have not the slightest doubt; but to steal it while his master lives can do him no good, since your uncle would, I conclude, simply have to rewrite the thing. Well, you must let this fellow know that you have your eye upon him—that you are not deceived in his character, although his master may be—in short, you must make him afraid of you, and that will not be difficult, for he is not, I should fancy, remarkable for personal courage.'

'He is the most cowardly cur,' said I contemptuously. 'How he could ever have cut his way through the Begum's troopers in that brilliant manner he used to describe to me when I was a child, I cannot imagine.'

'Your uncle was behind him with a loaded pistol, my good lad—one of the most powerful incentives to bravery it is possible to conceive. He had got all the ex-maharajah's money and jewels about him, and was well aware that he would not be permitted to indulge in pusillanimity—it would have been too expensive a luxury just then.'

'Very well,' said I grimly, 'I will endeavour to convince him that to run away from Hershell Point with our housekeeping money would be a dear-bought amusement also. I will shew this villain that since our last little affair together, "Master Marmy," as he still has the impudence to call me, has grown to be a man.'

The opportunity I wished for of coming to an understanding with the Hindu did not occur for many weeks, during which he gave me constant occasion for desiring it. Twice, under the influence of bhang, he was most impertinent in his manner towards Miss Glendell; and nothing but her own earnest entreaties, and consideration for my uncle's health, which any mental agitation would be sure to injure, prevented my taking vengeance on his fat carcass. Within the last few months I had grown surprisingly both in length and strength, and felt myself no longer an antagonist such as that hulking scoundrel could afford to despise. But it was not a mere thrashing that could effect any permanent improvement in him, although, without doubt, it would do him good.

At last my chance arrived. My uncle announced his intention, one morning, of accompanying Mr Glendell in his gig to Daisyport, where the surgeon had an appointment; so that, in case of any explosion of Tannajee's wrath taking place (in consequence of what I proposed), the smoke would have time to evaporate, as it were, before his master's return, who might therefore be spared all knowledge of the matter.

It was very seldom that my uncle now left the house, except for an hour or two; and no sooner had he departed on this occasion, than, as I fully anticipated, Tannajee proceeded to get comfortably fuddled upon such liquors as he had by him in his own room. I did not molest him in that apartment, first, because it lay near the kitchen, and I was unwilling that Martha or Nancy should be listeners to our altercation; and secondly, because it was important that what I had to say should be said in the study, whither I well knew he would presently repair, to enjoy his master's cheroots. Accordingly, as soon as the smoke thereof informed me of his being there, I slipped into my own room for an article which I placed into my coat-pocket, and then presented myself at the study-door. The Hindu was seated cross-legged on the carpet as usual, a bundle of cheroots on one side of him, and the brandy-bottle on the other; it was a liquor he did not get hold of every day, though he liked it best of all, even better than opium; and he looked perfectly well satisfied with his position. Not a trace of embarrassment appeared in his features at being thus discovered in this act of petty larceny; but they were darkened with a scowl at the intrusion of so unwelcome a visitor.

'You need not rise, Tannajee,' said I, although, indeed, he had not moved a limb. 'I must have a few minutes' conversation with you, and we might as well both be comfortable after our several fashions;' and I took a chair immediately opposite to him.

He did not utter a word; but I knew, by the puffing of his cheroot, that my manner caused him some excitement, if not alarm.

Digitized by Google

'We are not very good friends, you and I, Sambo' (I could not resist that word, when I saw the gleam of hate lit up his fishy eyes); 'but it is not about that I am come to talk to you: it is about my uncle Theo, and your conduct towards him.'

By no means the least provoking of the Hindu's characteristics was his pretence, whenever it suited him, of not being able to understand the English language, with which he was in reality well acquainted, and he affected this ignorance now.

'The Maharajah's out, Master Marmy,' said he—'gone to Daisyport, to catch another cold.'

'You ungrateful scoundrel,' cried I indignantly, although I had made up my mind to keep my temper; 'you dare to sneer at your master's illness, which he incurred in saving your own worthless life!'

'The Maharajah is very ill; he will die soon, and leave Master Marmy all alone, except for the little black girl. But she cannot become his wife, because he will have no money.'

'If you ever dare to speak of Miss Glendell in that manner again,' cried I, hoarse with passion, 'I will beat you to a mummy—not merely kick you, as I did before.' My cheeks were aflame; my whole frame tingled with rage, and yet I knew that I should *spoil* all if I hurried matters.

The Hindu had placed his hand in his girdle, doubtless feeling for some weapon, and the dusky glow upon his face shewed me that he felt the taunt.

'I repeat, Tannajee, I am not come here to talk of my own affairs at all, but rather of yours.'

'Of mine!' answered the Hindu contemptuously.

'Yes, of yours, and your master's. You have a common interest, you know.'

It was indiscreet of me to have hazarded this remark, and too late I perceived my folly.

The Hindu's breathing became oppressed; his fingers clutched at what his girdle still kept concealed, and his cheroot dropped from his other hand upon the floor. 'Uncle Theo, then, has told his nephew something,' said he slowly.

It seemed to me that this man would have stabbed me to the heart, had I answered: 'I know all.'—'Nay,' said I, as unconcernedly as I could, 'he has told me nothing except concerning your long service, the many years you have lived together as master and man; which should surely beget a mutual regard. Why, then, does it not so? Why are you callous to his sufferings? Why do you repay his kindness with insult?'

The Hindu's temporary excitement had quite subsided; he was smoking as before with his eyes half-closed, and a sottish sneer upon his lip.

'You are not moved by these reproaches, Sangaree Tannajee. You have neither sense of gratitude nor of duty; but there is one thing which I am determined to put a stop to—you shall not again walk in your sleep, my friend.'

For once, I do believe that the Hindu's air of not understanding what was said to him was not feigned—he even exhibited some faint trace of interest in my last observation.

'Sleep-walk?' said he. 'What does Master Marmy mean? Brandy not good for boy like him, only for men like Tannajee.'

'Master Marmy is sober enough, Sambo,' replied I very gravely; 'and this is what he means. You must not again come here, into this study, at night, to open your master's desk, and count his money, nor meddle with that secret drawer—*Chorwallah!*'

The Hindu had been gathering together his supple limbs while I was speaking, but at the word chorwallah (thief), which (as has been written) I had once overheard my uncle apply to him with particular emphasis, he was upon me in a moment with his naked knife; at the same instant, the shining barrel of my pistol met his wicked face, and he shrunk from it, an incarnation of baffled fury and cringing fear, back to the very wall.

'Drop that ugly knife, you scoundrel, drop it,' cried I, 'before I count three, or, by heavens, I pull this trigger. One—two!'

The weapon fell from his trembling hand, and clanged upon the boarded floor.

'Now, sit down where you were sitting, and listen to me, Tannajee.'

He cowered upon the carpet like a flogged hound, murmuring abjectly: 'Yes, yes; put away the pistol, Master Marmy.'

'No, not Master Marmy,' said I sternly; 'for the future, it's to be always Mr Marmaduke. You must henceforth mend your manners to me, as well as to your master. Let there be no more disrespect, no more rebellion, and as little drunkenness as you can help, you sot. A word from me, remember'—I pointed to the violated desk—'and I can send you to jail, where there is no opium, no strong drinks, and no cheroots. You have had your own way long enough, and have now come to the end of your tether. There is nothing left for you but either to behave yourself properly in my uncle's service, or to run away.'

I saw a momentary gleam of satisfaction cross his listening face.

'But you won't run away, you cur,' continued I with stern distinctness, 'for this most excellent reason, because, if I catch you at it, or overtake you after having done so, I will blow your brains out, as surely as your name is Sangaree Tannajee.'

This threat was perhaps not quite authorised in a legal point of view, but no decree of *Ne exeat Regno* could have had so much effect upon its object as had these pregnant words, assisted as they were by the application of the cold iron of the pistol-barrel to the ear-tip of the trembling Hindu. To add anything to that last touch would I felt be a bathos; so I rose without another word, and left Tannajee to his reflections.

HORSESHOES.

THE Romans shod their horses, though not in the same way as we do. Their *pedillum* lapped over, and therefore occasioned a rattling sound. Winckelmann has published a drawing of a Roman gem, shewing one man holding up the foot of a horse, and another man shoeing it. An iron horseshoe is mentioned by Appian; but shoes (*carbatinæ*) made of raw hides were, as Aristotle and Pliny attest, put upon camels in the time of war and during long journeys. Nero is said, by Suetonius, to have shod his mules with silver. Pliny records of Poppæa, the empress of Nero, that she used gold for the same purpose. These shoes had probably the upper part only formed of the precious metals, or perhaps they were plated out of thin slips.

In the horseshoes found in the German barrows, says Fosbroke, the shoes project not downward, but upward. At Colney, in Norfolk, were found Roman urns, and a horseshoe of uncommon

Digitized by Google

form—round and broad in front, narrowing very much backward, and having its extreme ends almost brought close behind, and rather pointing inward, *with the nail-holes still perfect*. An early instance of nails in horseshoes is furnished by one of a horse buried with Childeric I., who died 481, which was fastened with nine nails (*Archæologia*, iii. 35). Du Cange and Carew mention the custom of shoeing only the fore-feet. La Brocquiere describes the oriental horseshoes as being very light, rather lengthened towards the heel, and thinner there than at the toe. They were not turned up, and had but four nail-holes, two upon each side. The nails were square, with a thick and heavy head.

The present mode of shoeing horses was introduced into this country by the Normans, at the time of the Conquest. The Britons had been taught the use of them by the Romans, but their *pedolan* were probably considered too clumsy to be adopted by the Saxons. The Franks in the ninth century, and probably also the Normans, shod their horses in winter only.

It may be mentioned, *en passant*, that the male horse only was ridden by knights and people of any distinction in the middle ages; and that to ride a mare was always looked upon as a degradation. This was either a religious superstition, or an old Teutonic prejudice. In the thirteenth century, horses were obtained from Turkey and Greece, and at a later period from Barbary. The lord rode the *destrier*, or war-horse; the lady, the *palefroi*, or palfrey; the servant, the *roncin;* and the luggage was carried by a *sommier*, or sumpter. White horses were most prized, after them, dapple-gray, and bay or chestnut. It is curious to find that, in 1435, the queen of Navarre gave carrots to her horses. The ordinary price of horses in England, in the reign of Edward I., was from one to ten pounds. When St Louis returned to France from his captivity, the Abbot of Cluny presented to the king and queen each a horse, the value of which Joinville estimated at five hundred livres—equal to about four hundred pounds of our present English money. Feats of horsemanship were much practised; one of these was to jump into the saddle in full armour:

> No foot Fitzjames in stirrup staid,
> No grasp upon the saddle laid,
> But wreathed his left hand in the mane,
> And lightly bounded from the plain.

Horses were frequently given as bribes. The widow of Herbert de Mesnil gave King John of England a palfrey to obtain the wardship of her children; and one Geoffrey Fitz-Richard gave the same monarch a palfrey for a concession in the forest of Beaulieu.

A large pitcher, ornamented with horseshoes, was found in a Norman pottery, discovered on the estate of Lord Scarsdale, near Derby. It is figured in *The Reliquary*, and is a very interesting example of the period. The decoration is the badge of the ancient lords of the soil on which the vessel was made, and it was probably designed for castle use. The badge is that of the family of Ferrars, Earls of Derby, Ferrars, and Nottingham, who held Duffield Castle from the time of Henry III., when the lands were confiscated.

The out-of-the-way little capital, Oakham, has a unique prerogative: it claims a horseshoe from every noble or royal personage who lodges within its walls, or passes through its streets. In its ancient Norman hall may be seen these iron *souvenirs* of distinguished visits, some adorned with a coronet, and marked with the names of donors from Queen Elizabeth down to Princess Victoria. The castle was built by Wakelin de Ferrariis, *temp.* William I. The Smiths' Company at Chester was in existence there long prior to 1498, in which year Prince Arthur, son and heir of King Henry VII., paid a visit to the quaint old city. The prince's horses required to be re-shod, and the services of Thomas Edyan, master-smith, and senior alderman of the Smiths' Company, were called into requisition on that duty. This work was completed so entirely to the prince's satisfaction, that he then and there presented to the said Edyan a silver badge, bearing a shield, on which were engraved a horseshoe, pincers, and hammer, surmounted by a *fleur-de-lis* crown, which he granted to be thenceforward worn by his said master-smith, Thomas Edyan, and his successors, the senior aldermen of the Smiths' Company, for ever. A grave-stone, excavated at the western end of St John's Church, Chester, contained a fleur-de-lis cross, on either side of which were sculptured a horseshoe and a smith's hammer and pincers—clearly commemorative of a defunct member of the Smiths' Company at Chester, and possibly of that very Edyan whose workmanship had so won the prince's favour.

In Lord Herbert's Life of Henry VIII., printed in Kennet's *History of England* (ii. 17), we read that Henry 'having feasted the ladies royally for divers days, did depart from Tournay to Lisle (October 13, 1513), whither he was invited by the Lady Margaret, who caused there a joust to be held in an extraordinary manner; the place being a large room, raised high from the ground by many steps, and paved with black square stones like marble; while the horses, to prevent slipping, were shod with felt or flocks (the Latin words are *feltro sive tomento*), after which the ladies danced all night.' Shoeing with felt is mentioned by Shakspeare (*King Lear*).

Aubrey, in his *Miscellanies*, says: 'Under the porch of Staninfield Church, in Suffolk, I saw a tile with a horseshoe upon it, placed there to hinder the power of witches, though one would imagine that the holy water would have been sufficient.' The charm of the horseshoe lies in its being forked, and presenting two points. Thus, Herrick, in his *Hesperides*, says:

> Hang up *hooks* and sheers, to scare
> Hence the hag that rides the mare,
> Till they be all over wet
> With the mire and with the sweat;
> This observed, the manes shall be
> Of your horses all knot-free.

Even the two forefingers held out apart, are thought to avert the evil eye, or prevent the machinations of the lord and master of the nether world.

The pentacle, or seal of Solomon, is supposed to possess great power, as being composed of two triangles presenting six forked ends, and therefore called pentacle erroneously.

Mr Timbs states, that when Monmouth Street was a fashionable locality of London, it was noted for its number of horseshoes nailed over the doorways or on the sill. In 1813, Sir Henry Ellis counted here seventeen; in 1841, there were six;

Digitized by Google

but in 1852, there were eleven; now there are fewer. Nelson had great faith in the horseshoe, and one was nailed to the mast of the ship *Victory*. 'Lucky Dr James' attributed the success of his fever-powder to his finding a horseshoe, which he adopted as the crest upon his carriage. A horseshoe is very conspicuous at the gate of Meux's Brewery, at the corner of Tottenham Court Road, and on the trappings of the horses of the establishment. The lucky belief in the horseshoe may have led to its having been adopted as the ornamental portion of a scarf-pin.

Messrs Larwood and Hotten, in their *History of Signboards*, state that the horseshoe by itself is comparatively a rare sign. The three horseshoes, however, are not uncommon; and the single shoe may be met with in many combinations, arising from the old belief in its lucky influences. The sun and horseshoe is still a publichouse sign in Great Titchfield Street; and the magpie and horseshoe may be seen carved in wood in Fetter Lane —the magpie perched within the horseshoe, and a bunch of grapes being suspended from it.

DAISY'S CHOICE.

IN FIVE CHAPTERS.—CHAPTER V.

'Doctor, when may I go out into my garden again?' She was lying on a couch in the drawing-room, and he was sitting beside her. She was looking out of the window, through which, as she lay, she could see the tops of a couple of poplar-trees, rocking gently to and fro in the March wind. If she had looked at the doctor's face, she would have seen a shadow flit across it.

'I think it will be soon now, Daisy,' he said.

'How soon?'

'I can hardly tell you, exactly. You have been very patient; I know you must be weary of being a prisoner.'

'No; I am not so tired of that. I just took a sudden longing to go out and see the flowers in my garden. I know the crocuses must be all standing up in their stiff rows: they always used to remind me of soldiers, in yellow, and purple, and white uniforms. And my dear little hypaticas, they will be nearly over by this time.'

'How very stupid I have been,' said the doctor suddenly rising, and going out of the room. He went down-stairs, and out into the garden, where he pulled a great bunch of crocuses and hypaticas, and one or two late little snowdrops, that were nodding their delicate heads in a shady corner, under a rhododendron bush. His face wore a curious mixture of expressions as he pulled those flowers; there were both pain and pleasure in it, and above all, a sort of wistful tenderness, as if the flowers had been a bit of Daisy herself. He brought them to her, and laid their cool faces to her cheek.

'Thank you, oh, thank you!' she whispered, and her eyes filled with tears.

He brought her a vase to put them in, and left her arranging them; and every morning after that, he brought a bunch of flowers with him: she knew by them how the season was gliding away. After the crocuses came anemones and wall-flowers; and then, by and by, little fragrant rose-buds. One day, when he gave her a bunch of those, she said: 'I thought that I should have been able to gather those for myself by this time.'

He sighed a little, as he sat down beside her couch. 'You must be patient for only a little while longer,' he said. 'I must let you go soon.'

'Let me go!' she repeated wonderingly. 'You speak as if you were almost sorry about my being nearly well again.'

'I am very glad and thankful that you are so nearly well, Daisy,' he said.

She turned her head, and looked up in his face. 'You may be thankful, but you certainly don't look glad.'

'Do I not? But I *am* glad, or at least I try to be. Only, people are very selfish in this world, Daisy. When you were in pain, my child,' he went on in a low voice, and holding his face so that she could not see it, 'I suffered with you. I would have given my life to save you from suffering. But now that the pain is over, I only feel that you are mine as long as you lie here, and I am loath to let you go. But for all that, you know I won't keep you lying here an hour longer than I can help.'

'I know that,' she answered, smiling at him. He rose to go away. 'Doctor,' continued she, playing with her rosebuds, and not looking at him, 'I want very much to ask you a question. Will you answer me truly?'

'If I can.'

'When I rise from this sofa, shall I be quite well and strong?'

'I hope so; I truly hope so, Daisy.'

'Shall I not be a—a cripple? a helpless burden to other people?'

'I am almost sure you will not be that. At one time, I had fears for you; now, I have none.'

'Thank you,' she said, looking up at him; and her flushed, smiling face was very lovely. 'I believe you have really told me what you think. I know you are very true—you would not try to deceive me.'

'I think I know why you have asked that,' he said, looking at her a little wistfully. 'It is as I knew it would be; when you rise from that sofa, you will go away from us all. But I would not keep you here, if I could; I shall try to be glad to let you free from me and my care, Daisy.'

She gave him an odd little glance, and he thought she was going to tell him something, but she only said: 'I shall expect you in the evening; try to come early;' and he went away. She lay looking out of the window, at the lazily playing leaves of the poplar-trees against the blue summer sky, with that curious smile on her face. The smile staid even though her eyes became wet, and she had to wipe away a good many tears that rolled down her cheeks.

Curiously enough, almost the first person whom the doctor met after leaving Mr Barton's house was Vivian.

Digitized by Google

'When did you come?' he asked, shaking hands with him.

'Only this morning.—How is Daisy?'

'Nearly well. She will be quite well soon, I hope.'

'Really quite well?' asked Vivian sharply. 'Is there no risk of lameness, or anything of that sort?'

The doctor looked at him with something very like contempt. 'You need not be afraid; I think there is no such risk.'

'When may I see her?'

He considered for a minute. 'I think there is nothing to hinder you from seeing her whenever you like.'

'Now? To-day?'

'Yes, if you wish it.' Vivian did not know what it cost the doctor to say these words. 'Send up your card, and say I said you might see her, and they will let you in.'

He walked away, and Vivian went straight to Mr Barton's.

Daisy was lying just as the doctor had left her, when his card was brought. She flushed a little when she saw it. 'Did he say that he had seen the doctor?'

'Yes, Miss Daisy,' answered the servant; 'and the doctor said that you might see Mr Vivian.'

'Shew him up then;' and the next minute he was in the room.

His first impression was that she was lovelier than ever. She was dressed in a pale-blue wrapper, and her hair was lying in tumbled curls on her pillow. He looked anxiously at her face; there was no ugly fire-scar, such as he had dreaded; her beauty was etherealised by illness, her skin looked more transparent, her eyes larger and more brilliant. Her hands were folded on her breast, and she held the bunch of rosebuds which the doctor had given her. Vivian was too much of a poet not to see the exquisite beauty of the picture before him; yet even in that first minute he wished he had waited a little longer, that he might have seen if she could walk like other people, and he hastily resolved to commit himself to nothing. Yet the manner with which he went forward and took her hand was perfect, and his splendid dark eyes were full of tears.

'Dear Daisy,' he said almost in a whisper, as he sat down on the doctor's chair, 'I have been longing so to see you again.'

There was nothing to be said to this, so she only smiled, at the same time gently drawing away her hand, which he had continued to hold.

'I needn't tell you,' he went on, 'how I have suffered for you all this time. It has been a time of terrible anxiety to me.' He had managed to enjoy a tolerable share of London gaiety, and those who saw him there had certainly not guessed that he was suffering any very acute pangs.

'I am sure you were very sorry,' said Daisy. 'But I am nearly well now. Frank says that I shall be quite well soon.'

Now, Frank was the doctor's name, but Daisy had never before in her life called him by it, either to himself or to any one else. Why she did so now was best known to herself.

'Frank!' repeated Mr Vivian, looking mystified. 'Oh, you mean the doctor. Yes; he told me so.' And then there was rather an awkward pause, during which he became dimly conscious that Daisy was not exactly the Daisy he had known five months ago, and he resolved still more firmly not to say anything foolish.

'You must have had a tiresome time of it, lying here,' he said in his most sympathising tone.

She laughed brightly. 'O no; not after the actual pain went away. You know I have seen so much more of Frank than I do when I am well.' She said it more naturally this time. 'Usually, he is so busy that he can hardly spare time to be much with me; but since I have been ill, I really think he must have neglected his other patients to attend to me.'

Vivian had not come there to hear the doctor's praises, and he felt himself change colour, which annoyed him.

'I am sure he is an excellent doctor,' he said, with some slight shade of ill temper visible.

'Yes, he is,' answered Daisy gravely. 'No one can ever know what he has been to me at this time. I sometimes think that I must have died, had it not been for him.'

Then there was another silence, still more awkward on Vivian's part than the last, and he had always so hated awkwardness. He tried to get up a conversation, such as she had once delighted in, but somehow he failed to interest her. He felt uncomfortable, and wished ten times in the course of half an hour that he was back in London, or anywhere else except in Daisy's drawing-room. He was intensely relieved when it occurred to him to say that as she was not strong, he would not tire her by staying too long. She bade him good-bye very calmly, and he left her, the sense of failure strong upon him; and failure to such men as Mr Vivian is very painful.

The doctor had promised to be with her early, but it was past his usual time. When she heard his step on the stairs, she knew from the sound of it, as he slowly mounted, that he was tired, and she quite expected to see the worn, wearied look in his face. He looked round the room when he came in, evidently expecting to see some one else.

'I thought,' he said hesitating—'I did not think you would be alone.'

She smiled, and held out her hand to him. 'I have been alone nearly all day. Mr Vivian only staid a very little while.'

'If I had known that,' he said in a low voice, 'I would have come sooner. I thought that he would be here, and that you would not want me.'

She lay looking at him, silently; her eyes were moist, but the curiously sweet smile played round her mouth.

'Frank,' she said suddenly.

He started violently. She had never called him so before.

'Frank,' she repeated, 'I want to make a confession to you. May I?'

He looked at her. The sun was setting just opposite the window, and the rosy light was streaming in on her wavy hair, on her little folded hands, on her sweet calm face. It was very calm, and her clear eyes were raised to his. He was much agitated.

'I think,' he said, 'that I know what you are going to say. I have been expecting it. Don't say anything that pains you, Daisy. I can understand without your telling me.'

'I don't think you can,' she said smiling; 'and I don't think that you know in the least what I am going to say.'

Digitized by Google

She was very calm, he thought. He had expected a confession made with blushes and tears, not this smiling radiance.

'Once upon a time,' she went on, without moving her eyes from his troubled face—'it seems a long time ago—when I was very young and thoughtless, a good and noble man did me the great honour of asking me to be his wife. I didn't know what an honour it was then, but I do now.'

He raised his hand, as if to stop her; but she went on. 'I promised, not in the least knowing what I did—not knowing what a solemn thing it was to resolve to give my whole life to him; for I know now that I did not love him.'

She paused, trembling a little now.

'Dear Daisy,' he said, 'you need not go on. I know that; I know how selfish I was. Do not pain yourself needlessly, my child. I will make all the reparation in my power for that selfish act.'

'I know; but I should like to tell you all about it, if you will let me. You must have seen that when Mr Vivian came, I was greatly fascinated by him. He was different from any one I had ever known, and it seemed to me then that in a great many things he was nobler and higher. And I began to compare him with—the other, and at first I was foolish enough to believe that the advantage was on his side. He was so clever, he seemed, as I have said, to have something very noble about him. But, after a while, I began to find out that though he was a clever man, he was not a good man. I don't know how I found it out. I felt instinctively that he was not quite true, and that he loved himself better than any one else in the world. But I did not know till just the evening of my accident what it was to love any one. Then I found out; and all this time, while I have lain so much alone here, I have been thinking how foolish and wicked I was. But I didn't know—then. Frank, will you forgive me?'

She had hidden her face on his arm, and he bent his face close to her hair.

'What do you mean, Daisy?' he whispered. 'I don't understand.'

She put both her arms round his neck, and laid her cheek to his. 'I mean that if you will forgive me, and take me back, and let me be your wife, it will make me very happy, for I love you very dearly.'

He clasped her close to his breast. 'Oh, my love, my love!'

'I would have told you all this long ago,' she whispered, after a happy silence, 'but I feared that I was going to be a cripple, and I couldn't speak till I knew.'

'My darling! As if that would have made any difference to me,' he said with a joyous laugh.

Daisy had been six months married, when one day, as she was working in her garden, she heard her husband call to her. He had made the window of the surgery into a glass door, that she might get to her flowers without going out to the street, and he was sitting inside reading the papers.

'Look here,' he said, pointing to a paragraph, and giving her the paper. 'Our old friend has married an heiress.'

She read it, smiling. 'Frank,' she said, looking in at him through the half-open door, 'supposing I had married Vivian, would you have forgotten me so soon?'

'If you had married him, I would have lived single all my life, for your sweet sake,' he said fondly.

And I really believe that he spoke the truth.

ACROSS THE WALNUTS AND THE WINE.

In after-dinner talk
Across the walnuts and the wine.—*Tennyson.*

EVEN at Housewife's pleasant table, the elections and the change of ministry have of late infected the conversation. The few remarks connected with this subject that are at all adapted for our uncontroversial columns were made by Mr Bitter Aloes, with whom all governments are bad, although some of them may be worse than others. He was speaking with his accustomed pungency of a very great statesman indeed, whose aspirations, as we contended, were by no means so Democratic as they are supposed to be.

'There is no one,' said he, 'in the present Cabinet who is so tenderly attached to that hereditary aristocracy who has done so much for all of us. To see him shake hands with a duke, sir, is a most affecting incident. He does not know how to let go of him. *It is like Jacob wrestling with the angel.*'

'And, by-the-bye,' cut in Funnidog swiftly, 'have you heard Lord Derby's last riddle? It is notorious, now that he has given up statesmanship, that he passes his time in constructing conundrums, which are the only means by which he can assist his party: everybody knows that.'

'I don't believe a word of it,' exclaimed Colonel Thunderbomb excitedly.

'Let us, however, hear the riddle,' insisted Housewife, whose principles are 'progressive.'

'Well, it's a Charade,' said Funnidog in a tone of deprecation.

'Off, off!' cried the company with one voice: 'no charades!'

'He will be asking a double acrostic next, you mark my words,' said Aloes darkly; 'and I would as soon have a double-barrelled gun pointed at me.'

'Upon my word of honour,' pleaded Funnidog, 'it is as simple as snapdragon. Even Thunderbomb will guess it; he will indeed.'

'I'll bet he don't,' growled the colonel confidently.

'"I should be my First," said my Lord Derby, "if I could throw my Second at my Whole."—Now, what's that?'

'I see,' cried Housewife, like a small boy in a *vivâ-voce* class.

'Of course you do; everybody sees,' muttered Aloes; 'it's mere child's play.'

'Come, Thunderbomb, I promised you should guess it,' urged Funnidog. 'It's the name of a great statesman—a premier.'

'Disraeli,' ejaculated the colonel.

Roars of laughter.

'Well, no, it's not *exactly* Disraeli,' explained Funnidog. 'It's Gladstone.'

From this (not unnaturally) the conversation turned upon the perception of the Humorous, the faculty of understanding jokes. Housewife instanced Samuel Rogers's story of the posts in the Green Park. One of those unfortunate persons who talk for the sake of talking, asked Sidney Smith why the posts at the Park entrances had been put more closely together, as had lately happened.

Digitized by Google

'Ah!' replied the Wit with gravity, 'you have no idea what fat persons used to get into that Park.'

Rogers considered the nature of the reception of this reply as the best test he was acquainted with of the humorous faculty. If a man saw no fun in *that*, it was his opinion that he would see fun in nothing.

Mr Macpherson protested, on the part of his fellow-countrymen, that although in England such obtuseness might exist, no human being north of the Tweed could have taken the reply as serious.

'And yet on the Mound, at Edinburgh,' observed Mr Bitter Aloes, 'I solemnly declare that I have seen a beggar stand for weeks, with this inscription written upon his breast: "Blind from my birth. I have seen better days."'

'And what for no?' inquired Mr Macpherson gravely.

The laughter, this time, was not only general; it even included the colonel. 'Why, don't you understand,' explained he, 'that the beggar shewed he had no sense of fun, since he had written on him that he had "*seen* better days," when he had been blind from his birth!'

'I take exception to the syllogism a'thegither, colonel,' replied the imperturbable Caledonian. 'The term "seen" is clearly employed in a metaphorical sense, and has nae connection with pheesical vision; and secondly, I deny that the man shewed himsel deficient in the humorous faculty, inasmuch as bein' blind he couldna see anything amiss in his superscription. If there be any contradiction in terms, it must lie at the door o' some ither body. Besides,' continued Mr Macpherson, taking a lucifer-match box from his pocket, 'you needna gang to the Mound, at Edinburgh, for examples o' blindness, whether pheesical or mental, when Messrs Bryant and May here — which, I believe, is no a Scotch Firm—can find nae mair apposite trade-mark for their lucifers, that are sae grand a *Security against Fire*, than an Ark, which is more commonly associated wi' security against an antagonist element. Nay, in this very day's paper, I read, amang the literary advertisements, the following: *New Magazine: Under the Crown; price one shilling.* Noo, I reckon it might hae struck the enterprising proprietors, or, at all events, the dootless intelligent editor, that the words *Under the Crown* are quite superfluous, if the cost o' the periodical is stated to be a shilling.'

'You have given the Southron as good as he gave,' observed Housewife; 'but, talking of new magazines—which seem to be as plentiful as blackberries, and like them (in many cases), not to be devoured if you can get anything else—there is one I see called *The Idealist*, which invites all our youthful poets to contribute to its columns. Can its editor be aware of what a comprehensive invitation he has issued, or of the nature of the guests he has thus welcomed? I should like to see his photograph "before and after" the first week of his editorial labours; his experience of the *Ideal*—and the Real.'

'Just so,' interposed Funnidog, with his usual precipitation: 'that reminds me of a story about false teeth. I have a female cousin—a worthy soul, and I daresay a blessing to her immediate belongings, but whose hospitality to strangers (and distant relatives) is not prodigal. In fact, she is one who looks twice at a shilling before she parts with it, and does not always part with it even then. But she was inclined to be liberal and even lavish in one special direction. I don't know what wore out her teeth—it was certainly not over-feeding—but they were not good, and her secret ambition for years had been to procure a set of false ones, such as should defy the shocks of Time, and be the admiration of all beholders. At last, she accumulated the sum required—it was said to have been saved by curtailing the household expenses—and invested it in ivory. She paid a hundred guineas for the set, and was naturally very proud of them. She put them on for the first time last New-year's Day, when about to visit some friends at Margate. Her husband, whose constitution had perhaps been a little deteriorated by her domestic economy, was for journeying thither in the usual manner by railway; but the good lady maintained that it would be a sin and a shame not to take advantage of the unusually mild season, and go down cheap by the steamer. Now, mark the sequel, which bears a noble moral for those who would be economical at the expense of others: the winds blew, and the waves arose, and the usual consequences took place among the passengers. The ship had scarcely reached the mouth of the Thames before those costly ivories escaped from that of this good lady. It would have been almost as cheap to her, and much more pleasant, to have taken a special train.'

'The views, however,' observed Housewife, 'which folks entertain respecting economy are often extremely curious. A girl who is pretty, good-tempered, sensible, and altogether charming, is considered a bad match; while some wholly undesirable young woman, who happens to have a few thousand pounds, is reckoned a good one; notwithstanding that the former may understand how to keep house and manage affairs, which is a fortune in itself. I knew a case in which a most eligible damsel was pronounced by his friends as unfit to marry a certain young divine, because, forsooth, she was "without a penny." He was weak-minded enough, after having proposed to her in form, to give way to their remonstrances, and she was strong-minded enough to bring an action against him for "breach of promise." The damages were laid at five thousand pounds, and she gained them (I am happy to say) in full. The impressionable defendant, who had reaped nothing but ridicule from his former advisers throughout this trying ordeal—which included a protracted cross-examination by Serjeant Valentine (always retained in these delicate cases)—was now brought to reason. He addressed the young lady in a strain even more fervent than before: "I have behaved infamously," he owned, "but if you will only forgive and forget, we may be happy yet [with other verses]. The only objection which my friends had to you is now removed. They can no longer say that you are without a penny, since you have five thousand pounds of your very own." And the happy pair were married accordingly.'

'Talking of marriage,' remarked Funnidog, 'reminds one of the Hatch, Match, and Dispatch (as folks used to call the Birth, Marriage, and Death department of the *Times*), in connection with which a curious announcement has appeared in the Irish papers. Some noble Lord, it seems, presented a pair of Ostriches to certain zoological gardens, with the understanding, that if anything happened in the feathered family, he was to be informed of it at once. He accordingly received this notice from the committee of management:

Digitized by Google

"My Lord, we have the pleasure to inform you that the female ostrich has laid an egg. She does not, however, concern herself further with the cares of maternity, and we hardly know what is to be done. For the present, therefore, we have engaged the greatest goose we could procure to sit on the egg, *until your Lordship comes yourself.*"

THE MONTH:

SCIENCE AND ARTS.

THE Hyde Park and City Railway, another project of underground engineering, is now brought forward, with promise of a tunnel from the Marble Arch to the Post-office, under the present line of roadway. By this selection of the course of a public thoroughfare, where land will not have to be bought, the cost will be L.1,400,000, instead of L.4,500,000. Mr Hawkshaw, engineer of the proposed line, states that it shall be constructed without any interruption of the street-traffic, between the hours of six in the morning and ten at night. Any diggings made during the night will be covered in, and the paving replaced before 6 A.M. There will be, in all, nine stations; the trains are to be drawn by wire-ropes from fixed engines at each end, so that the air of the tunnel will not be poisoned by the smoke and vapours of locomotives; and as there can be no collisions, trains will start every two minutes. When the Blackwall Railway was first opened, and for some years afterwards, the carriages were drawn by wire-ropes; and in the opinion of competent engineers, the substitution of locomotives for ropes was a mistake, whether regarded from the scientific or the economical point of view, as will perhaps be demonstrated when the new line here noticed begins to work.

In England, Scotland, and Ireland, there are 3381 telegraph stations from which messages are sent, of which number 738 are exclusively for railway service. The total length of wire employed by all these stations—including the quantity twisted in 4695 miles of under-sea cable—is 103,783 miles. These figures enable one to form a notion of the magnitude of the telegraphic operations now carried on, and of the enormous task which government will have to undertake when they carry out their scheme of buying out all the companies, and taking all the telegraphs under their own control. All this has grown up within the past thirty years, and called into exercise a prodigious amount of scientific and mechanical ingenuity. The Royal Society did well at their last anniversary to present their most honourable medal to Sir Charles Wheatstone, for to the instruments invented by him the present facility of telegraphic communication is mainly due.

The Turkish government, which it is the fashion to describe as behind the age, have ordered four life-boats from a builder in Limehouse, for use, we may imagine, on the stormy coasts of the Black Sea. On the coasts of Great Britain and Ireland, there are 189 life-boat stations; and it appears that the number of lives saved in eleven months of 1868 was 697: a fact worth recording.

Dr Tyndall has made some very surprising experiments by passing vapours of different chemical substances into an exhausted glass tube, and then sending through them a beam of electric light. The vapour is at first invisible, but after the light has shone through it for a few seconds, it forms clouds of a blue, green, red, or mauve colour, which break up into the most fantastic and beautiful forms, endowed with a rotary motion, which adds greatly to their effect on the eye. In some instances, the cloud takes the shape of funnels overlapping each other, and, curiously enough, the inner ones can be seen through the outer ones. The most surprising of all is the vapour of hydriodic acid. The cloud is seen cone-shaped, supporting vases of exquisite form, and over the edges of these vases fall faint clouds, resembling spectral sheets of liquid. Afterwards, a change takes place—roses, tulips, and sunflowers appear; then come a series of beautifully shaped bottles, one within the other, and on one occasion there was seen the shape of a fish with eyes, gills, and feelers. What, it may be asked, is the use of all this fantastic beauty? The answer is, that Dr Tyndall finds therein illustrations of chemical decomposition, examples of molecular physics, and explanations of the formation of cloud and the blue colour of the sky, whereof we shall hear more by and by, and by which science will be enriched.

Last summer, at the instance of the Royal Society, the Admiralty lent a steamer to Dr Carpenter and Dr Wyville Thomson, for a dredging cruise in the North Atlantic, to the westward of the Faröe Islands. The special object in view was to ascertain whether living animals would be found at great depths, and in what geological conditions. The late Professor Edward Forbes propounded the theory that life ceased at 300 fathoms, and that the shells and animals found at that depth would be quite colourless, through want of light. But the cruise above mentioned, as well as other dredging operations, establish the fact, that brightly coloured shells, and animals with colour in their bodies, are met with at the greatest depths to which the dredge has yet descended—from 500 to 600 fathoms. Moreover, the abundance of minute animal life on the deep sea-bottom is amazing; and from what Dr Carpenter stated at a recent meeting of the Royal Society, naturalists and microscopists may expect large contributions of interesting objects to study for years to come. Another fact important to geologists is, that their cretaceous period is no longer to be regarded as belonging exclusively to the past, for the formation of chalk at the bottom of the sea in the North Atlantic is going on at the present time, and therein are found living animals identical with some hitherto known only as fossils of the chalk.

Great things, as readers know, are effected by water-power, and now we hear that ships are to be steered by pressure of the water in which they float. There will be no wheel, no tiller—such as is now in use—and no tiller-ropes, but an apparatus, simple, yet so powerful, that therewith a boy might steer the *Great Eastern*. In the absence of full descriptive details, we can only say that the invention comprises a hydraulic chamber fixed to the keel, in which the pressure is exerted, and that from this an iron rod passes to the rudder-head. We shall, perhaps, not have to wait long for further information, for Captain Inglefield, F.R.S., the inventor, has been appointed to one of the largest ships in the royal navy, in order to make a thorough trial of his invention.

An improved method of shoeing horses has been introduced from America, where seven years' experience have fully proved its merits, not the least of which is that it preserves horses from some of the maladies to which they are liable when shod in the ordinary way. The shoe at present in use is too heavy, too cumbrous, compels the horse to keep his leg in a false position, and impairs his usefulness long before the time of natural decay. The weight of a set of the new shoes is five pounds less than that of the shoes worn by omnibus horses: each shoe is made to fit the hoof exactly, and is not allowed to project beyond the heel: the nail-holes are pierced at such an angle as insures the nails entering the hoof in the safe direction for avoiding injury to the foot, and the shoe is always nailed on cold. The frog of the foot, which is now always cut away by farriers, is left to grow, and it is of important use to the horse in securing foothold. The shoe for common use has a toe-calk, and one on each side, but these do not prevent the horse bringing his foot to the ground in a natural position. For frosty weather, a different kind of shoe is used, but with neither of them can there be accumulation of snow or earth under the sole. The inventor and patentee of this new shoe is Mr Goodenough, who was formerly associated with Mr Rarey. It has been tried on a number of horses belonging to the London General Omnibus Company, and with satisfactory results.

From the province of Volterra, in Tuscany, there comes good news for agriculturists, and for all who use mineral fertilisers. There are *lagoni*, or lakes, in that province, the waters of which for some years past have been made to give up the boric acid which they contain in considerable quantities. Professor G. Ville, of the Jardin des Plantes, Paris, has recently demonstrated that, in addition to boric acid, the waters, and the vapours rising from crevices in the earth, contain a large amount of sulphate of ammonia. This mineral is so much in demand for agricultural purposes, that we trust measures will be taken to extract a constant supply, and export it to all parts of Europe.

Sheep multiply so prodigiously in Australia, that the boiling down of the animals merely for the extraction of the tallow, has grown into a business of huge proportions. Four hundred sheep are cut to pieces, and thrown into a big boiler, steam from another boiler is turned on, and soon the carcasses are reduced to a pulp; the tallow rises to the top, and is drawn off through large taps into barrels for export. The gravy and other juices, the remains of the meat, and the bones, which are so softened as to crumble easily in the hands, are given to pigs. Such soup as that would be gladly eaten by hundreds of poor people in England. The quantity must be great, for four thousand sheep are boiled down in a day.

Tallow-chandlers complain that they cannot get enough of good beef-tallow for their purposes. The reason is, that tricky traders buy beef-tallow, and send it to Belgium, whence it is exported as Ostende butter. In the treatment of the tallow to fit it for the market, a kind of flour is mixed with it, and this flour takes up thirty per cent. of water. So, eaters of Ostende butter will do well to remember that in every one hundred pounds they buy, there are thirty pounds of water, to say nothing of the flour. To pay the price of good butter for water, tallow, and flour, is a grievance not easy to put up with.

BLUE AND WHITE.

'Of all the colours, sweet sir, what may your favourite be?'
And the lad I had nurst back to life looked up, and made answer to me:
'Two colours I choose—blue and white.' Then up from my throat did there spread,
Yea, to my very temples, a dye of the happy red;
For a maiden's face will flush at the lightest thing evermore;
And blue was the ribbon that bound my hair, and white was the gown that I wore.

'May I tell you all, lady sweet?' 'Ay, sir, an' it please you so.'
All alone with each other we sat in the firelight's glow:
He, the lad whom our men had found nigh dead close by,
And the mother that bare him could never have nurst him more gently than I.

'Sister—nay, pardon my freedom—but oh, you have been so good,
I well could wish that I owed you the duty of brotherhood;
Crown your sweet favours with this, the greatest of all, and be
As tender to her I love, as you have been tender to me.'

Then over every sense there swept down a terrible, dim
Dusk of oblivion, as there I sat, and listened to him.
Silence a moment, and then, by the helping of God His grace,
I answered: 'Yea, brother, I will,' with a very smile on my face.

'Now, God bless you, sister. Listen. A year ago
She gave herself to me for ever and ever, and so,
One sweet autumn eve, in the time of the falling of dew,
I gemmed her little white hand with a circlet of sapphires blue.

'She, my own lady, taketh ever the most delight
In the calm virginal colours—the delicate blue and white;
And, sister, mine eyes were soothed with a sense of lovesome repose
When I saw you this evening wear the hues that my darling chose.'

Oh! but the bonnie blue ribbon pressed on my head all too tight;
Oh! but my heart beat wild beneath its virginal white;
Oh! but the hours were long as I knelt in the dark alone,
Moaning: 'My Father, teach me to say but "Thy will be done."'

ZEKEL FLINT.

IN SIX CHAPTERS.—CHAPTER I.

My father-in-law's name was Ezekiel Flint, but I never knew a man before or since who could boast of so many nicknames. Not that he cared: he rather enjoyed them; and he'd pull that long dry walnut-shell face of his into as many puckers as could lie upon so many square inches of surface, even closing his eyes, for fear that any of the fun should escape, and give a tight grin as he would say: 'Let 'em go on, my lad; let those laugh who win. I can shew more wrinkles than any man in the state; and if yew'll shew me the boy who can do me, I'll say thanky.'

It was his boast that he had never yet been done, cheated, taken in; and though it was common enough to hear him called Flinty, or Skinflint, from his closeness; Sam Slick, or Wooden Works, from his resemblance to the celebrated clockmaker, yet he was so constantly boasting that he had never been done, that his popular *sobriquet* was 'Old Raw.'

I don't know how it is, but whenever you meet with an extra ugly, dry, sharp, biting old file, it's ten to one but that he has a pretty daughter. Zekel Flint had, and he knew it, adding many a pound to the contents of his leather bag by letting her serve in his store; her branch being the tobacco, cigars, and 'eye-openers.' Zekel managed the rest, serving over his rough-boarded counter everything that a miner could be expected to need up there in Californy in the early days of the gold-fever. Of course there were not wanting plenty who said that he wetted down the tobacco, and bought everything of the commonest and cheapest; that his heavy boots would never keep the water out for a week; that his pickaxes always broke short off; while his shovels were made of refuse iron. Let that be as it may, I know one thing, and that is that he was always perfectly straightforward in his dealings: he put a pretty good percentage upon all his goods, whether groceries or notions; but, as he said, very fairly, look at the risk! While if a miner wanted to exchange dust or nuggets, Zekel's scales would bear examination. It was a ticklish thing, certainly, to cheat the rough customers who came to the different stores; but dangerous or not, they were greatly cheated by very many of the storekeepers.

Tired out with our long dangerous journey, I reached Zekel's store with some half-dozen companions one evening, and being young, and as the old man afterwards told me, green, I must hang about, in spite of my gold-madness, smoking more common rank tobacco, and drinking a great many more eye-openers than were good for me, so that I might be close by blush-cheeked Ruth. Sharp and ready she was with her tongue, but let any customer make in the slightest degree too free, and if he was not put down upon the instant by Ruth, there was generally some long, broad-shouldered chap ready to hoist the obnoxious personage out, so as to get rewarded by a glance of Ruth's bright eyes.

I don't know how it was, but there was something in Ruth as a lass that seemed to win respect from all who saw her; and though roughs in plenty were up at the diggings, and revolvers and bowies had been drawn in quarrels about Old Raw's daughter, still there was a large proportion of decent hard workers, who meant to make gold to keep, and not to spend in fiery whisky and short carouses. These quiet ones always shewed a certain respect for the old man and his daughter, so much, that he would have been a bold fellow who would have ventured to insult Ruth Flint twice. Besides, up in that region, where law was in those days, along with order, upon the other side of a great desert, many hundreds of miles wide, a man had to depend for protection a good deal upon his own right hand. Zekel knew it, and within reach of his right hand there was always a six-shooter.

'Yew'd better come on at once,' said the men of the party to which I belonged; but somehow or another I could not see it, but made excuses of being done up with the journey—unwell—wanting to rest a few days, and one thing and another,

Digitized by Google

trying all the while to believe them myself, till my companions went off and left me, and I was obliged at last to confess that I was making myself a great fool, and mooneying about Old Zekel's store to get a smile or a kind word from Ruth Flint—favours which I was compelled to own she was quite as ready to accord to any other customer.

I knew it was stupid and unreasonable, but there I used to loaf about day after day, scowling with jealous eyes at every young fellow who entered the store, jealous of their pleasant words, of Ruth's smiles, and, above all, of the different presents she received: quaintly shaped nuggets to hang round her neck—necklace or locket fashion—or with the seal and key of her watch. I'd have given anything to have known whether she had any serious inclination towards any of the men who frequented the store. Perhaps at night I would make sure she had such towards some prosperous digger, and make up my mind to play moth round the candle no more; and the next morning I would get up with the determination of just saying good-bye to Ruth, going up to the diggings, prospecting a bit, and then making my fortune right off. But that interview always spoiled my determination, for I used to fancy that when I talked of going, there was some little show of regret in Ruth's tone; and though she was only pleasant and chatty, treating me as she would any other visitor, yet I was disarmed, and the next day I was still hanging about.

'Seems to take yew a 'nation long while to get off,' said Old Zekel. 'Strikes me if yew're as long scraping up your dust when yew've made your fortune, yew won't have much time left to spend it.'

'But I am going directly, Mr Flint,' I said bitterly; for Ruth was laughing coquettishly at something a tall stalwart young fellow had just said to her, as she held him a light for his pipe.

'Fine lass; ain't she?' said the old man drily, as he read my thoughts. 'I'm darn proud o' that gal, I am. But yew air going—air yew? Well, just as yew like. I came here fust meanin' to dig; but I know better. Take my advice, young un: don't yew dig—yew let others dig, and yew take their dust. That's the way to make a pile. They will have their eye-openers, and juleps, and weed; and they must eat and drink. Mine's the rale grit gold-digging, my lad. Yew can't do me.'

The old man's was perhaps very good advice, but I had no money for trading—having come down to my last shilling; and that day, while Ruth seemed to be more merry and light-hearted than usual, giving smart repartees to those who addressed her, and now and then a sidelong merry glance towards where I loafed about in the sulkiest of humours, I cursed my folly again and again. My companions had been gone a fortnight, and rumour said had had very good luck; while, for the sake of a flirt who only thought about my money, I had been wasting time, singeing my wings, and making a fool of myself. I told myself that; but being a strong, six-foot fellow, it might have been rather unlucky for any one to have said the same.

Evening had come, but as this was obliged to be my last day, I was determined to stop till closing-time at the store, and if I had a chance, just say a few words of farewell, and perhaps of reproach to Ruth. I was in no very amiable mood, especially as more fellows were lounging about than usual, and I could not get a word with the pretty little witch. I was ready to quarrel with any one, and no doubt looked very unamiable.

The store business was about over for the day, except at Ruth's end, and Old Zekel was busy dropping a board over a box here, shutting up another there, jamming down lids over canisters, and, after his fashion, shutting up shop. I then saw him turn his back, pull out a biggish leather bag, hold it under the lamp a minute, then tie a string round its neck, and put it in his pocket. He then took down a cigar-box from behind some more upon a shelf, put it back, sprawled over the counter after lighting his cigar, and being on my side of it, stood looking, with his hands far down in his pockets, at Ruth and her admirers, as she mixed for this one, supplied another with cigar or light, and all the while made herself generally agreeable.

'Smart gal—a fortun' in herself,' muttered the old man; and then turning to me as I lolled sulkily against a part of his rough shanty: 'Hang it, man, what a rank cigar!' and he snatched it out of my mouth, and brought down a solid foot of about twenty inches upon its glowing end.

'I gave her twelve cents for it, anyhow,' I growled.

'Ah!' he said, and his eyes half-closed as he grinned, 'some of them do turn out rather queer. Try that un, my lad,' and he handed me a genuine Cabana, whose silvered skin glistened as I lit it by the smoky lamp.

'Don't go till I come back,' said he; 'I shan't be long;' and he slowly sauntered out of the little store, so that I could follow him with my eyes for some little distance, when I just caught sight of the bright end of his cigar as he turned short off to the right.

Here was a chance, I thought: now, if those great hulking boobies lolling about the counter would only go, I might have her for ten minutes to myself, and know my fate. It seemed to be now or never; but as time slipped quietly away, the first seemed to be dissolving fast in the second. I saw Ruth glance more than once towards where I stood at the dark end of the hut, smoking away furiously, for in spite of the goodness of my cigar, my feelings were as ruffled as ever; while every compliment paid, and every light musical laugh I heard, seemed to stab me.

All at once, glass in hand, as pleasant a little Hebe as ever stepped, Ruth came to my end of the store, and passed me the little drink of her own mixing, as she said: 'Don't be unsociable. Why don't you come to the other end?'

'Ain't wanted,' I growled sulkily; but I took the mint julep all the same, and then watched its bearer as she tripped back and began laughing and chatting again as merrily as ever. 'Rum fish, are women,' I said to myself; and then perhaps the cigar did begin to act, for I fell to thinking over my own affairs, how I'd get on, and one thing and another, till I hardly noticed first one and then another of the young fellows say 'Good-night,' and stroll off to bed, till, coming back to the present, I could see at the other end of the store Ruth leaning back from the counter as far away as she could get, and busy over some bit of work, into which she seemed to be sticking the needle viciously, and then snatching it out. Lolling upon the counter, and leaning over so as to stare at her, was a great ugly fellow in a red shirt, sucking away at a black, short pipe, and even at that

Digitized by Google

distance wearing upon his face that stupid, contented look of a man who has had more liquor than is good for him.

'I think it's quite time you were gone,' I heard Ruth say snappishly, but without looking in my direction.

'I daresay yew do, my dear,' was the answer; 'but I'm not going yet;' and then the great ugly ruffian leered at her.

'I'd go and kick him out,' I said to myself, 'if she'd only look at me as much as to say: "Do, please!"' But no; Ruth would not glance in my direction, while Red Shirt leaned farther and farther over the counter, so that he had only to reach out a hand to touch her.

'He'd only better,' I said to myself; and at the same moment I caught myself wondering whether his belt was strung. 'Why don't she ask me to put him out?'

'I've made thous'n doll'rs up yon,' I heard him say, 'and I'll make thous'n more, my dear.—Have a hole bored in that, and wear it for my sake.'

As he spoke, he held out a rough piece of gold that would have weighed half an ounce.

'I only wear presents given me by friends, thank you,' said Ruth; 'and it is shutting-up time now; so please go.'

'No, 'tain't, my dear, not till Old Raw comes back; and there's a boy smokin' there, t' other end, and I'm agoin' to stop and take keer of yew till the old man comes back. 'Tain't prudent for yew to be left alone, I guess.'

'You wicked little flirt,' I muttered, 'why don't you ask me to put him out?' But she would not look at me, though I was dying to have a go at the great brute, and I knew she must want me to do so.

'I can take care of myself, thank you,' said Ruth in a quiet firm way, that I had never seen before; but it had no effect upon Red Shirt, who began to grow more unpleasantly familiar.

'Only one look—only one appealing glance, and I'll have him out in a twinkling,' I said to myself.

'I won't look at him'—she told me afterwards—'I won't turn towards him even; I'll die first,' Ruth said to herself; 'and if he is not man enough, and has not sufficient respect for me to interfere, I'll never ask him, I reckon.'

'I never see a nicer nor a whiter little hand than yourn,' said Red Shirt, leering again.

'I think that is my father coming now,' said Ruth hastily, as she turned one of her pretty little pink shelly ears towards the door, so that the light shone full upon it, and made my blood dance as I felt how I should like to put my lips there, and tell her how I loved her.

'No, 'tain't,' said Red Shirt. 'I guess them theer feet of hisn could be heered easy a mile off. He ain't a-comin' yet, my pretty. But don't yew be skeered; I'll take care o' yew.'

'Ah, do, *do*, DO—please, do give me one look,' I said to myself—'only one!'

'I won't ask him—I won't look at him: he's a cruel, cruel, cowardly fellow, lounging about here for nearly a month, and then pretending so much, and now won't come and save me from this wretch. Ah, if father would only come!'

'Wot's the good of hidin' them pretty little hands like that now?' says Red Shirt. 'There now; don't pull; yew'll hurt yerself. It's only my fun, yew know; and I've kissed every pretty gal in the state; and if I don't have one from yew tew, why, it's strange.—Now, don't pull away so, or yew'll be abreakin' some o' the old man's bottles.'—'Oh!'—'What does "Oh!" mean?—Say, stranger, I think yew'd best take them theer hands outer my belt; or, p'raps, I shall fall on tew yer!'

'Oh!' Yes; that 'Oh!' did it, along with one look of reproach that told me more than she could have said in an hour; for just as I was about to give up myself, and making ready to dash at Red Shirt, he leaned a little farther over, dropped his pipe, and caught one of Ruth's pretty little plump hands in his great paws, drawing her to him, without her having a chance of escape. I think we both felt that we had held out long enough; and before Red Shirt had finished his sentence, I had swung him up by his belt, and the next moment he would have been outside the store, when the belt broke, his revolver fell to the right, his knife to the left, and he flat upon his back at my feet.

CHAPTER II.

'Yew've made a mistake, my young fren,' says Red Shirt, as, slowly picking up his great body, he made towards where his bowie lay beneath the lamp; but I stopped that; and the next minute, we were struggling backwards and forwards—now up against one of the poles of the hut, now against the boards or the counter; then he had me bent back over a barrel, but I recovered myself; and though I heard Ruth give one short sharp scream as we closed, directly after, all was still as she stood watching the struggle.

'Yew've made a mistake, my young fren. Yew oughter have gone on with yewer party, I calklate;' and as he spoke, he drove me up against the hut-wall, and I felt his hand at my belt as he drew out my revolver; but with a violent effort I dashed it from his hands, and it flew across the hut, exploding as it struck the thin boards. But before I could stop him, he had hold of my knife, though I had him by the wrist the next moment, and saved myself from a stab.

I could not speak for passion, as I struggled with the great ruffian. But he, in his slow ponderous way, kept on talking the whole while, as we were now here, now there, down and up, doing no end of damage to the goods in the store. But I held tightly to his wrist, as I tried to force him to quit his hold of the knife, feeling that he would have not the slightest compunction in planting it somewhere between my ribs, if I gave him a chance.

'Yew've made a mistake, my young fren,' he says again. 'Yew thought you'd caught 'possum, and it turns out ter be grizzly.—Ah! would yer?—Now, then; now you have it. Gently, gently.—Mind yer ribs.—That's a cracker, ain't it? I'm sorry for yer, sartain; but all I kin dew is ter say as I won't take yer scalp. Take it easy, stranger, I won't raise a har.'

More than once I thought he would have driven the knife into me, for the brute was strong as a bull; but, being pretty active, I escaped more than one thrust, till, in spite of all my efforts, I could feel that I was getting the worst of it, when, in the midst of a fierce struggle, wherein we were swinging to and fro, my foot caught in a piece of matting we had dragged down, and I fell with stunning violence, just as Ruth gave another shrill scream of alarm.

Digitized by Google

I was half-stupefied by my fall; but I could feel Red Shirt with one hand at my throat, and by the light of the lamp make out the gleam of the blade as he raised my bowie to strike. It seemed an age, though, before the blade came, when, as I instinctively wrenched myself aside, I felt a sensation as of ice darting through my shoulder. Then there was the thud of a heavy blow, and my adversary rolled on one side, and I heard a voice I seemed to know say: 'That 's the thick end, my boy; I narer like to use the barrel without it 's something very particklar.—Air yew hurt, my lad?'

'Oh, father—oh, father, the blood!' I heard a voice sob, and I tried to look towards the spot from whence it came, but I could only see the lamps—dozens, hundreds of lamps dancing up and down, and whirling round and round.

Then there were voices buzzing about my ears; and it seemed to me that the store was full of people, as one voice more loud than the others said: 'That 's the third man that 's been knifed this week. Time some alteration was made.'

''Tain't my fault, Old Zekel,' seemed to be buzzing in my ears.

'No'—'No'—'No!' chorused the rest; and then all seemed blank.

CHAPTER III.

'I b'lieve they 'd ha' lynched him, my lad, I dew indeed,' said Old Zekel; 'but the sheriff and his party got him away, and I fancy as they let him make tracks in the night. 'T all events, he sloped, and a good thing too. We 've a vast too many rowdies here.'

The old man went on smoking, while I, with my bandaged shoulder, sat, a week afterwards, in the back or private part of the store, where I could see Ruth bustling about, serving customers, and, being weak, I s'pose my eyes filled with tears as I thought of the kind way in which I, a comparative stranger, had been tended during the past week.

'Nonsense, nonsense,' said the old man hastily, as I thanked him. 'Good lad, good lad. We 're in yer debt. Pity yew don't stay here and trade somehow—ain't it, Ruthy?'

'I don't know. I—I think so, father,' said Ruth in a hesitating way as she entered, very different to her habitual self-composed manner.

'Yew don't know—yew think so,' said the old man with a sly twinkle of his eye; and then he went himself to attend to a customer or two; and, at my request, Ruth eased my bandages, and made my head comfortable.

'I 'm afraid your wound does not go on so well as it should,' said Ruth, when we were alone.

'No,' I said; 'I 'm afraid not; and I don't see how it can.'

'Why not?' said Ruth shyly. 'We do all we can, don't we?'

'Not quite,' I said, as I got hold of the little white hand, that was not drawn away. 'It won't heal while I am so anxious, and in such a state of uncertainty.'

'What! about getting up to a claim in the gold part?' said Ruth, turning away her pretty head.

'Please—please, don't be cruel, darling,' I whispered. 'Don't be hard upon me, now I am weak, and have a bad wound.'

The little bright face was turned to me in a moment, and there were tears in both eyes as they looked full in mine—another hand resting upon the one that held its fellow. She did not speak: I did not want her to; but it seemed to me then to be the height of human enjoyment to lie back there, propped up by pillows, with those eyes looking at mine so earnestly, and, I hoped, lovingly.

'But you won't go, then?' she whispered at last.

'Not if you will promise too,' I said, though it was with something of disappointment in my heart as I wondered how I was to live.

'Ruthy!' shouted the old man, and she rose to leave; but I would not loosen the hand I held; and having still some little strength, I used it so that the little head came nearer and nearer to mine, and though I felt the sunny hair brush my cheek, that first kiss was so light a touch that had Ruth in after-times declared it to have been no salute at all, I should hardly dare have contradicted her.

'Change again—five-dollar piece,' growled Zekel, the same afternoon, giving loose silver from his leather purse or bag; and then, dropping in the gold piece, he came and sat down by me. 'I 'm fraid that spot of yourn won't get well in a hurry, youngster, and yew 'll be here some time yet.'

'I won't trouble you for more than another day,' I replied, for he seemed to be tired of me.

'Mother o' yourn partial to red pepper, and takes whisky, my lad?' said the old man drily.

'Not that I know of,' I said, wondering what he meant. 'Why do you ask?'

'Son seems hot and peppery, that 's all,' said Zekel.

'Hot—peppery,' I answered. 'No; I 'm not; only I 'm sorry to be a burden to you any longer.'

'Ain't heered me grumble, have yew?' said Zekel. 'Ah! I see; it 's Ruthy, is it?'

'No,' I said hastily, while the colour came into my pale face. 'God bless her!'

'Hope so,' said Zekel; and then he sat and stared at me—through me—on both sides of my head; and then he picked out one particular button upon my shirt and stared at that. 'No,' he said at last, 'that there spot o' yourn won't be down well for six months; and if I was yew, my lad, I should say as follows on*toe* me: "Zekel Flint," I should say, "I did mean for to go up to the claims, but I 've met with a misfortune, and if yew could find me a little to do in the store till I get quite right again, I should take it as a favour, not being partic'lar," says yew, "to amount of sal-a-*ry*, so long as fixins for the inside comes reg'lar, and I can pay for a bed elsewhere."'

'And what should you say to that?' I exclaimed eagerly.

'Who? me?' said Zekel. 'Ah! I shouldn't say nothing, only that I wouldn't mind, if Ruthy here wouldn't take no notice.—Get out, yew smooth kitten!' he exclaimed, as his child threw her arms round his neck. 'I don't mean anything else. He 's not sharp enough. Yew 're for a man as can see a little further into a millstone than your old father.—Coming!' he shouted, as some one began to hammer the counter; and once more Ruth and I were alone; and I suppose it was from excitement, but that wound at such times used to require a deal of tending from those little white hands—little hands, like many more in this world of ours, that whether they belong to a cottager's daughter, a storekeeper's child in a new town in a gold region, or to the fairest flower of an aristocratic

Digitized by Google

family, are always balm-laden, tender, soothing, as they always have been from the days when Eve may have laid some cool moist leaf on Adam's aching brow.

AUDUBON.

JOHN JAMES AUDUBON, the naturalist of America, was the son of a Frenchman, by a lady of Spanish extraction. Hence, perhaps, those who believe in 'blood,' in other respects than that 'it makes excellent black-puddings,' may derive the fact, that he was mentally one of the vainest, as he was physically one of the most beautiful of mankind. However this may be, he inherited from his father a fine estate in Louisiana, where he was born, and where his earliest recollections 'were associated with lying among the flowers of that fertile land, sheltered by the orange-trees, and watching the movements of the mocking-bird.' Very early in life, he was removed to France, and began to receive a thoroughly national education. He was taught to play adroitly upon the violin, flute, flageolet, and guitar, and became a proficient in dancing; while for drawing-master he had the famous David, to whom he owed his earliest lessons in tracing objects of natural history. Even as a child, his chief delight was to make excursions into the country about Nantes, from which he usually returned at eve, laden with the nests and eggs of birds. Indeed, before he had reached manhood, he had completed as an amateur, and when quite another profession was in prospect for him, nearly two hundred sketches of the Birds of France. His father destined him in vain, however, to follow the French Eagles under Napoleon, and at last consented to his embracing commercial pursuits; he was accordingly despatched to America to superintend the family estate there.

At Mill Grove, 'hunting, fishing, and drawing occupied,' he writes, 'my every moment; cares I knew not, and cared nothing for them.' His happy employments were only diversified by falling in love; he offered his hand to the daughter of a neighbour, Mr Bakewell, an Englishman, and in course of time was accepted. Though, without doubt, an attractive wooer, he must have appeared, in that outlandish region, a very strange one, for 'it was one of my fancies,' confesses he, with *naïveté*, 'to be ridiculously fond of dress; to hunt in black satin breeches, to wear pumps when shooting, and to dress in the finest ruffled shirts I could obtain from France.' Yet this apparently effeminate dandy was not only a most excellent shot and true backwoodsman, but had even then proposed to himself that work on American Ornithology, which Cuvier pronounced to be in its completed form 'the most gigantic biblical enterprise ever undertaken by a single individual.' His mode of life at this time resembled that of Shelley. 'I ate no butcher-meat, lived chiefly on fruits, vegetables, and fish, and never drank a glass of spirits or wine until my wedding-day. To this I attribute my continual good health, endurance, and an iron constitution. So strong was the habit, that I disliked going to dinner-parties, where people were expected to indulge in eating and drinking, and where often there was not a single dish to my taste. I cared nothing for sumptuous entertainments. Pies, puddings, eggs, and milk or cream was the food I liked best; and many a time was the dairy of Mrs Thomas, the tenant's wife of Mill Grove, robbed of the cream intended to make butter for the Philadelphia market. All this while I was fair and rosy as a girl, strong as any one of my age and sex could be, and as active and agile as a buck. And why, have I often thought, should I not have kept to this delicious mode of living?'

Of his skill as a marksman, it need only be said that once when he was skating with his future brother-in-law down the Perkiominy Creek, he made a wager with him that he would put a bullet through his companion's cap when thrown into the air by the latter, while he himself was passing at full speed; and won it. The produce of this skill made his house at Mill Grove resemble a museum. 'The chimneypiece of his room was covered with stuffed squirrels, racoons, and opossums, and the shelves around were likewise crowded with specimens, among which were fishes, frogs, snakes, lizards, and other reptiles. Besides these stuffed varieties, many paintings were arranged upon the walls, chiefly of birds. The walls, too, were festooned with all sorts of birds' eggs, carefully blown out, and strung upon a thread.' These palmy days, when work was not only pleasant to him, as it always continued to be, but the enjoyments of wealth were also within his reach, were nearly cut short by a curious incident, which certainly manifested that this young naturalist was not born to be drowned. 'Having engaged in some duck-shooting up the creek with young Bakewell and some young friends, it was found that the ice was full of dangerous air-holes. On our upward journey, it was easy to avoid accident; but the return trip was attended with an accident which had nearly closed my career; indeed, my escape was one of the inconceivable miracles that occasionally rescue a doomed man from his fate. The trip was extended too far, and night and darkness had set in long before we reached home. I led the party through the dusk with a white handkerchief made fast to a stick, and we proceeded like a flock of geese going to their feeding-ground. Watching for air-holes, I generally avoided them; but increasing our speed, I suddenly plunged into one, was carried for some distance by the stream under the ice, and stunned and choking, I was forced up through another air-hole farther down the stream. I clutched hold of the ice, and arrested my downward progress, until my companions arrived to help me.'

It was three months before the hero of this frightful adventure became himself again; but after that time he favours us with the following pen-and-ink sketch of his own personal appearance, which seems to have suffered no blemish: 'I measured five feet ten and a half inches, was of a fair mien, and quite a handsome figure; large, dark, and rather sunken eyes, light-coloured eyebrows, aquiline nose, and a fine set of teeth; hair, fine texture and luxuriant, divided and passing down behind each ear in luxuriant ringlets as far as the shoulders.' We cannot in this world expect everything, and it is scarcely a discredit to the possessor of such great natural advantages that he was not a good man of business, and indeed was so obviously ill adapted for the commercial calling, that we find him posting a letter containing eight thousand dollars without taking the precaution of reading it. When his father died, and matters fell entirely into his own hands, he began to suffer in pocket from this cause; and when his own speculations failed, he took to himself a partner, who completed his ruin. There

were to be no more satin breeches nor ruffled shirts for Audubon; and unfortunately it was not himself alone who had to suffer; a wife and children now shared his misfortunes. These straits of the great naturalist are the more to be deplored, since in his case he did not need the spur of poverty to urge him on, while, on the other hand, they undoubtedly placed him more than once in a humiliating position. We shall see this man of genius coming, only too often, hat in hand (and with no great independence of manner either), to 'request the patronage' of very inferior folks indeed. A date is a very rare fruit in this biography, but Audubon must have been about forty years of age when poverty first fell upon him. In 1822 (when he was two-and-forty), he writes: 'I entered Louisville with but thirteen dollars in my pocket. I found my friends very cool, and my position very insecure. My son Victor I managed to get into the counting-house of a friend, and I engaged to paint the interior of a steamer.' A poor prospect enough; for already his wife had to live apart from him, since, for economical reasons, she had undertaken to be 'companion to a lady;' while he had himself, for two or three years, subsisted as a portrait-draughtsman, on very low wages indeed, though he possessed some skill, and succeeded so well in portraying the features of the dead, that a clergyman's child was exhumed, in order that he might take a likeness of the corpse. But the simple fact is, that even had his opportunities been greater, Audubon could never have prospered through any ordinary channels. As his biographer, Mr Robert Buchanan,* well remarks, 'he was ever a wanderer at heart, and shewed the weaker side of his nature whenever he shaped himself to civilised society.' He was a born gipsy, and ought never to have married at all; and it is painful to read of the continuous separation from his family—who seem to have dearly loved him—which poverty compelled.

Once in the woods, his natural high spirits assert themselves; and even in the cities, which his necessity causes him to visit, the voice of nature —'a flock of wild ducks overhead in London, a gathering of pigeons on the trees of Paris'—always makes him glad. There was never a more thorough naturalist by nature, if we may so speak, than Audubon. Even the eccentric Rafinesque, whose luggage was but a bundle of plants, and who could scarcely be induced to wash himself, was not his equal as an explorer.

Constant familiarity with the wilder aspects of nature seems, in some cases, to have somewhat blunted Audubon's perceptions of them, or at least in describing them he relates what is humorous rather than what is sublime. He was staying with a physician in a log-hut on the banks of the Mississippi, when he experienced his first earthquake. 'The earth waved like a field of corn before the breeze; the birds left their perches, and flew about not knowing whither; and the doctor, recollecting the danger of his gallipots, ran to his office, to prevent their dancing off the shelves to the floor. Never for a moment did he think of closing the doors, but, spreading his arms, jumped about the front of the cases, pushing back here and there the falling jars, but with so little success, that before the shock was over he had lost nearly all he possessed.'

In his description of a hurricane, he is more successful. He had been fishing for 'dew-fish'—creatures that weigh a hundred pounds apiece—off the coast of Florida, and was returning to land, when signs of the storm began to appear. The sun grew obscure with clouds, along which rolled vivid flashes of lightning, and a low murmuring noise possessed the air. 'We were not more than a cable's length from the shore, when with imperative voice the pilot calmly said to us: "Sit quite still, gentlemen, for I should not like to lose you overboard just now; the boat can't upset, my word for that, if you will but sit still: here we have it!" Reader, persons who have never witnessed a hurricane, such as not unfrequently desolates the sultry climates of the south, can scarcely form an idea of their terrific grandeur. One would think that, not content with laying waste all on land, it must needs sweep the waters of the shallows quite dry to quench its thirst. No respite for a moment does it afford to the objects within the reach of its furious current. Like the scythe of the destroying angel, it cuts everything by the roots, as it were, with the careless ease of the experienced mower. Each of its revolving sweeps collects a heap that might be likened to the full sheaf which the husbandman flings by his side. On it goes, with a wildness and fury that are indescribable; and when at last its frightful blasts have ceased, nature, weeping and disconsolate, is left bereaved of her beautiful offspring. In instances, even a full century is required before, with all her powerful energies, she can repair her loss. The planter has not only lost his mansion, his crops, and his flocks, but he has to clear his lands anew, covered and entangled as they are with the trunks and branches of trees, that are everywhere strewn. The bark overtaken by the storm is cast on the lee-shore, and if any are left to witness the fatal results, they are the "wreckers" alone, who, with inward delight, gaze upon the melancholy spectacle. Our light bark shivered like a leaf the instant the blast reached her sides. We thought she had gone over; but the next instant she was on the shore, and now, in contemplation of the sublime and awful storm, I gazed around me. The waters drifted like snow; the tough mangroves hid their tops amid their roots, and the loud roaring of the waves driven among them blended with the howl of the tempest. It was not rain that fell; the masses of water flew in a horizontal direction, and where a part of my body was exposed, I felt as if a smart blow had been given me on it.'

His account of the Great Pine Swamp, in Pennsylvania, is very picturesque, but too lengthy for extract. He dwelt in the heart of it for some time, accumulating specimens of birds, and was apparently never happier than beneath its solemn shade. Florida, too, was one of his most favourite hunting-grounds, with its long 'barrens,' diversified by 'hummocks' of live-oak. As the traveller approaches these dark oases, 'the air feels cooler and more salubrious, the song of numerous birds delights his ear, the herbage assumes a more luxurious appearance, the flowers become larger and brighter, and a grateful fragrance is diffused around. . . . . Overhead, festoons of innumerable vines, jessamines, and bignonias link each tree with those around it, their slender stems being

Digitized by Google

interlaced as if in mutual affection.' The existence of these 'hummocks'—often of vast extent—has evoked quite a peculiar race of beings—the woodcutters of Florida. They go to work without knowing whether the immediate object of their exertions will repay them or not. Even when the mighty trunk is prostrate, their labours may have been in vain. 'They cut at both extremities, and sound the whole of the bark, to enable them to judge if the tree has been attacked by white rot. If such has unfortunately been the case, there, for a century or more, this huge log will remain, till it gradually crumbles; but if not, and if it is free of injury or "wind-shakes," while there is no appearance of the sap having already ascended, and its pores are altogether sound, they proceed to take its measurement.' Many of these woodcutters inhabit lonely cabins, with their wives and children, and do not work in company. In this case, it is not uncommon for them to be Lost in the Woods; every tree in these vast hummocks is the counterpart of its fellow; the grass, where it has not been burned, is so tall that a man of ordinary stature cannot see over it, so that one must move with caution, lest the ill-defined trail should be deviated from. Moreover, at the season which best suits this sort of labour, heavy fogs come on, so as to limit the view to a few yards. One of the 'live-oakers' detailed to Audubon a terrible personal experience of this sort. He describes his horror when, upon the rising of the fog, he did not recognise a single object about him; how the gray trees spread their giant boughs over him, and the rank grass extended on all sides, and not a living creature crossed his path. 'The sun was now setting with a fiery aspect, and by degrees it sunk in its full circular form, as if giving warning of a sultry to-morrow. Myriads of insects, delighted at its departure, now filled the air on buzzing wings. Each piping frog arose from the muddy pool in which it had concealed itself, the squirrel retired to its hole, the crow to its roost, and, far above, the harsh croaking voice of the heron announced that, full of anxiety, it was wending its way to the miry interior of some distant swamp. Now the woods began to resound to the shrill cries of the owl and the breeze, as it swept among the columnar stems of the forest trees, laden with heavy and chilling dew. Alas! no moon, with her silvery light, shone on the dreary scene, and the *lost one*, wearied and vexed, laid himself down on the damp ground.' He wandered aimlessly about throughout the next day, and when night again approached, fatigue, anxiety, and hunger had almost driven him frantic. He knew that he must have walked more than fifty miles, and yet he had met with no drop of water to allay his burning thirst; yet, such was his hunger, that when, by God's special grace, as it seemed, he met a tortoise, which he knew if followed undisturbed, would lead him to water, he had not patience, but killed the creature with his axe, and satisfied both hunger and thirst at once—for a few hours. He also met with a racoon; but except for these, he had no food save cabbage-trees, frogs, and snakes. At last, after seven weeks of wandering, his clothes in tatters, his bright axe dimmed with rust, and his feeble frame but a skeleton covered with parchment, he laid himself down to die: in which miserable condition he was providentially discovered, eight-and-thirty miles from his own cabin.

Another interesting class of people among whom Audubon was thrown, in pursuit of science, was the lumberers of Maine, who at the approach of winter leave their homes, and march into the pine-forests with their oxen, to work and dwell for months. Their bodies swathed in flannel, their heads and brows covered by the skin of the racoon, their legs encased in moose-skin, and their feet thrust in broad moccasins, they stand hacking from dawn to eve at the majestic pines. These the oxen haul to the nearest frozen stream, till the ice becomes covered with the accumulating mass, when, their task thus completed, they wait for the breaking up of winter. The logs then swiftly reach the dams on the swollen streams, and throughout the summer continues the task of cutting them into boards. But sometimes the course of the stream is interrupted by narrow gorges. 'One of the latter is situated about half a mile above the mill-dam, and is so rocky and rugged in the bottom and sides as to preclude the possibility of the trees passing along it at low water, while, as I conceived, it would have given no slight labour to an army of woodsmen or millers to move the thousands of large logs that had accumulated in it. They lay piled in confused heaps to a great height along an extent of several hundred yards, and were in some places so close as to have formed a kind of dam. Above the gorge there is a large natural reservoir, in which the head waters of the creek settle, while only a small portion of these ripple through the gorge below, during the latter weeks of summer and in early autumn, when their streams are at the lowest. At the neck of this basin the lumberers raised a temporary barrier with the refuse of their sawn logs. The boards were planted nearly upright, and supported at their tops by a strong tree, extended from side to side of the creek, which might there be about forty feet in breadth. It was prevented from giving way under the pressure of the rising waters by having strong abutments of wood laid against its centre, while the ends of these abutments were secured by wedges, which could be knocked off when necessary. The temporary dam was now finished. Little or no water escaped through the barrier, and that in the creek above it rose in the course of three weeks to its top, which was about ten feet high, forming a sheet that extended upwards fully a mile from the dam. My family were invited early one morning to go and witness the extraordinary effect which would be produced by the breaking down of the barrier, and we all accompanied the lumberers to the place. Two of the men, on reaching it, threw off their jackets, tied handkerchiefs round their heads, and fastened to their bodies a long rope, the end of which was held by three or four others, who stood ready to drag their companions ashore, in case of dangers or accident. The two operators, each bearing an axe, walked along the abutments, and, at a given signal, knocked out the wedges. A second blow from each sent off the abutments themselves, and the men, leaping with extreme dexterity from one cross log to another, sprung to the shore with almost the quickness of thought. Scarcely had they effected their escape from the frightful peril that threatened them, when the mass of waters burst forth with a horrible uproar. All eyes were bent towards the huge heaps of logs in the gorge below. The tumultuous burst of the waters instantly swept away every object that

Digitized by Google

opposed their progress, and rushed in foaming waves among the timber that everywhere blocked up the passage. Presently a slow heavy motion was perceived in the mass of logs; one might have imagined that some mighty monster lay convulsively writhing beneath them, struggling, with a fearful energy, to extricate himself from the crushing weight. As the waters rose, this movement increased; the mass of timber extended in all directions, appearing to become more and more entangled each moment; the logs bounced against each other, thrusting aside, submerging or raising into the air, those with which they came in contact. It seemed as if they were waging a war of destruction, such as the ancient authors describe the efforts of the Titans, the foaming of whose wrath might, to the eye of the painter, have been represented by the angry curlings of the waters; while the tremulous and rapid motions of the logs, which at times reared themselves almost perpendicularly, might by the poet have been taken for the shakings of the confounded and discomfited giants. Now the rushing element filled up the gorge to the brim. The logs, once under way, rolled, reared, tossed, and tumbled amid the foam, as they were carried along. Many of the smaller trees broke across; from others, great splinters were sent up, and all were in some degree seamed and scarred. Then, in tumultuous majesty, swept along the mangled wreck: the current being now increased to such a pitch, that the logs, as they were dashed against the rocky shores, resounded like the report of distant artillery, or the angry rumblings of the thunder.'

There is much temptation to give more such extracts: to select other vignettes from this collection of Pictures of Labour; to tell of Swan-lake, with its 'thousands of large and heavy swans,' whose skins go to the ladies of Europe, and where, 'though wild geese and ducks are so numerous, no one condescends to give them a shot;' of the rock off Labrador, apparently covered with snow two or three feet deep, which turns out to be white gannets—'birds in such a mass and of such a size as I never saw before, all calmly seated on their eggs with their heads to windward,' but who, when on the wing, cause a thick foggy atmosphere, like snow-flakes, all about the rock; and lastly, of the brutal 'eggers' of Labrador, who recklessly crush the chick within its shell as they trample over the nests of the unhappy birds, so that they spoil as much as they rob: but want of space forbids us to quote more. Let us briefly summarise the history of the publication of that colossal work, in the compilation of which Audubon spent his life. When not shooting birds, or drawing them, he is always like them upon the wing, crossing to England, to France, and back again in search of that very rare bird indeed—the Subscriber. The cost of his projected volume, which, however, was to appear in numbers, was not less than One Hundred Pounds. The size of the work was double-elephant folio, and the engravings represented the birds of America, as well as the objects by which they were surrounded, of *their natural size*. They were portrayed at their ordinary avocations, and placed on branches of trees decorated with foliage, blossoms, fruits, &c., while even the insects, reptiles, and fishes that constitute their food were accurately introduced. The plates were coloured in the most careful manner from Audubon's originals.

'Probably no other undertaking of Audubon's life illustrates the indomitable character of the man more fully than this. He was in a strange country, with no friends but those he had made within a few months, and not ready money enough in hand to bring out the first number proposed, and yet he entered confidently on this undertaking, which was to cost over a hundred thousand dollars, and with no pledge of help, but on the other hand discouragements on all sides, and from his best friends, of the hopelessness of such an undertaking.'

Audubon found himself at the verge of this great undertaking in London, with but one sovereign left in his pocket, and without a single friend to whom he could apply for more; yet he extricated himself from his difficulties by rising at four in the morning, working hard all day (with his pencil), and disposing of his works at a price which would scarcely have been thought remuneration by a common labourer. 'To give an idea of his actual difficulties during the publication of his first volume, it may be sufficient to say, that in the four years required to bring it out, no less than fifty of his subscribers, representing the sum of fifty-six thousand dollars, abandoned him.' But he was as 'pushing' as any bagman, and it must be owned did not lose a chance through any excess of diffidence. His vanity was something ludicrous. At Edinburgh, at that time not ill termed the modern Athens, he was exceedingly well received, which he attributes to two causes: first, to his personal beauty; secondly, to his acknowledged genius. 'I have taken to dressing again,' says he, 'and now dress twice a day, and wear silk stockings and pumps. I wear my hair as long as usual. *I believe it does as much for me as my paintings.*' Some judicious friends, however, persuaded him at last to appear a little more like other people, and his giving way to their request is thus narrated in his diary, with a great rim of black around the words, as though it were an Obituary: '*Edinburgh, March* 19, 1827.—This day my hair was sacrificed, and the will of God usurped by the wishes of Man. As the barber rapidly clipped my locks, it reminded me of the horrible times of the French revolution, when the same operation was performed upon all the victims murdered by the guillotine. My heart sank low. JOHN J. AUDUBON.'

It is impossible to deny that the great Naturalist was a sad tuft-hunter, even when his necessities did not require any social humiliation, and the most humorous thing in the book occurs in his wanderings about Labrador, where, at whatever out-of-the-way English settlement he is hospitably received, he leaves the inmates a copy of a letter about nothing particular which he once received from the Duke of Sussex. When George IV. sent to say he would take a copy of his work—'on the usual terms, not as kings generally do, but as a gentleman'—it is no such wonder, therefore, that he went into an ecstasy; but there was solid pudding in that act of patronage. In France, our author fared very ill. The price of his projected volumes terrified the Parisians, and he got only two subscribers, the Prince d'Essling and the Duke of Orleans, after weeks of importunity: whereas, in Manchester alone he had secured thirty names. [In London, by-the-bye, he had a curious interview with Rothschild, which, let us hope, for the credit of commerce, he has not drawn quite so faithfully as he drew his birds.] But, finally, the mammoth

Digitized by Google

undertaking was introduced to the world, and made a profound sensation. Audubon had his reward at last, not only in material dollars, but in what he valued more, the admiration of his fellow-creatures. All that could perish of him expired January 7, 1851. His faults, which were on the surface of his character, will soon be forgotten; what he has done of good will long remain. His own great work is his monument, and renders epitaphs unnecessary. Still, we may well say, in farewell, with his biographer, 'Audubon was a man of genius, with the courage of a lion and the simplicity of a child.'

THE LAW OF INNS.

'SHALL I not take mine ease in mine inn?' Undoubtedly you may, under certain conditions, which, it must be confessed, are very much in your favour. Whether, as in Falstaff's case, you 'shall have your pocket picked' in consequence, depends very much on the sort of inn you enter, and the sort of company you keep. The regulations respecting inns, taverns, and alehouses are, some of them, very ancient, and it is obvious why they should be so. By the very nature of them, they must early have required the supervision of the magistrate. Wayfarers, men of passage, who were here to-day and gone to-morrow, were not unlikely, in rough days, to amuse or enrich themselves at the expense of those who were settled, or, as was done in many cases, at the expense of those who were in like condition with themselves, travellers. But besides this, there were other considerations which tended to bring houses of entertainment under rule. Before railways existed, and by their power of annihilating distance, brought all places within comparatively easy reach of each other, and so rendered people almost independent of lodgings during the continuance of their journey, every one who travelled, whether on public or private business, was necessarily dependent for the prosecution of his journey on the houses of entertainment which might happen to be on his road. Without some public regulation on the subject, the innkeeper might, as the saying is, 'cut his coat according to his cloth,' and raise his prices when a rich man came to him for lodging, and refuse a poor man entertainment, in hope that some better customer would come by that way. Indeed, he might have turned out the inferior guest, to make room for a superior; and might have acted towards his public guests precisely as a private man might, if he chose, behave towards his private ones, receive them or not, just as he pleased. Again—and there was ample opportunity—he might act in collusion with professional robbers and bandits to rob his guests, and under the cloak of privacy hide his iniquities, until some glaring deed revealed him. Under magisterial inspection, the risk of this was considerably lessened; and there were reasons of state policy, some of which will be set forth presently, why the innkeeper, taverner, and victualler should be treated as a public servant, responsible to certain laws, which the legislature decided should be rather in the interests of the public than of himself.

Distinction was formerly made between those who lodged as well as fed their guests, and those who only fed them; and there was even a further distinction between those who fed the servants and horses of their guests as well as the guests themselves, and those who simply provided food and lodging for the guests. The former of the last two named were called *hostelers*, and the latter *herbergeours*—at least in London, where the regulations respecting them were many and curious. The privilege of keeping such establishments seems mostly to have been restricted to freemen of the city; and even when foreigners were sometimes admitted to this favour, they were commanded to keep 'in the heart of the city,' and not to have houses on the banks of the Thames, which was a favourite place for inns and taverns. Down to the time of Edward III., there was a regulation that no hosteler or herbergeour in London should lodge a man for more than a day and a night, unless he would be responsible to the city for any offences the guest might commit. It was also the rule, at times when arms were not allowed to be worn in the city, as in the thirty-seventh year of Edward III., for the hostelers to take possession of the weapons of their guests until their departure. At other times, when the regulations were not so rigid, it was the duty of hostelers to warn their guests not to carry arms after curfew, nor to go wandering about the streets of the city. They were forbidden to retail food or drink to any but their customers, and to them they were allowed to charge twopence a gallon for ale, which cost them a penny or a penny and a half. They were also enjoined, by an order made in the time of Edward III., to sell oats and hay at reasonable rates; but as they disregarded this general order, a few years afterwards a city ordinance was passed forbidding a hosteler to take more than eightpence a bushel for oats, and twopence-halfpenny for a horse's hay for a day and a night. In the time of Henry IV., a night's lodging for a man cost a penny.

Taverners and alehouse-keepers, that is to say, sellers of wine and retailers of ale, were under other restrictions too numerous to be all set out here, but it may be mentioned that neither of them might keep their houses open after curfew, and they were bound to sell liquor in approved measures, and at a certain price, which was fixed from time to time by the city authorities. From the gable of wine-taverns projected poles supporting signs, or a bunch of leaves (hence the proverb, 'Good wine needs no bush'), which were frequently the subject of magisterial orders.

Complaints against the evils arising from the great number of alehouses, and from the acts of the men who frequented them, were repeatedly made in all sorts of forms; but little general notice was taken of them till the time of James I., though Edward VI. had passed an act—the first of the licensing acts—forbidding any one to keep an alehouse or wineshop without a licence.

It was probably due to the Puritan element in the first parliament of James I., an element which was just then beginning to make itself felt, in many things for good—that An Acte to restraine the inordinate Hauntinge and Tiplinge in Innes, Alehouses, and other Victualling Houses, was passed. The parliament being virtuous, resolved that if there were to be any 'more cakes and ale,' they should be enjoyed under certain restrictions. By the above-mentioned act, therefore, the good and the wrong use of inns was declared, and order was taken for securing the one and punishing the other. 'The ancient, true, and principal use of inns, alehouses, and victualling houses, was for the receipt,

Digitized by Google

relief, and lodging of wayfaring people travelling from place to place, and for such supply of the wants of such people as are not able by greater quantities to make their provision of victuals, and not meant for entertainment and harbouring of lewd and idle people to spend and consume their money, and their time in lewd and drunken manner.' So much by way of declaration. The act then went on to forbid, under a penalty of ten shillings, to be forfeited by the innkeeper to the poor of the parish, any one, not a traveller, to 'remain and continue drinking or tippling' in the inn or alehouse, unless he were invited to do so by a traveller staying in the inn; or unless he were a day-labourer, when he might drink 'for one houre at dynner tyme;' or unless he were a labourer lodging in the house. It seems, however, that on 'urgent and necessary occasions,' to be approved by two justices of the peace, the law might be suspended, as it would be in case of public festivities, dinners, &c. This same act forbade an innkeeper or alehouse-keeper to sell 'lesse than one full quart of the best beere or ale for a penie.'

No punishment was provided by this statute for the tipplers themselves, the alehouse-keeper alone had to pay the forfeit; but three years later, it appearing that 'the loathsome and odious sin of drunkenness is of late grown into common use within this realm, being the root and foundation of many other enormous sins, as bloodshed, stabbing, murder, swearing, fornication, adultery, and such like, to the great dishonour of God and our nation, the overthrow of many good arts and manual trades, the disabling of divers workmen, and the general impoverishing of many good subjects, abusively wasting the good creatures of God'—the parliament imposed a fine of three shillings and fourpence, with an alternative of four hours in the stocks, upon all persons found tippling and boosing in alehouses. Upon persons convicted of drunkenness, a fine of five shillings was ordered to be inflicted, with an alternative of six hours in the stocks. This order is in force to this day. Further provisions for 'repressing of drunckennesse' were made by James I., including an order that innkeepers and taverners who permitted 'tippling' should, on conviction, not only be fined ten shillings, but be incapacitated from keeping an alehouse for three years.

Various laws in connection with licences have been passed under different reigns, the principal one in force now being one of George the Fourth's. Under this law, a publican, innkeeper, or victualling-house keeper must get a licence to sell excisable liquors from the commissioners of excise, and from the local magistrates; the licences are good for a year, and must be annually applied for at the General Annual Licensing Meetings of the magistrates, which are held throughout England by order of the act of parliament. Any complaints are heard at these sessions, and the magistrates have power to withhold or grant the licence, as they see fit. For the sale of beer, cider, and perry, in certain cases, a licence from the excise commissioners is all that is required, but the persons so licensed are under heavy penalties in case of misbehaviour, and are subject also to the supervision of the police. By an act of the present queen, it is forbidden to all vendors of beer, fermented or distilled liquors, to sell to any one, unless it be to travellers or to lodgers in the house, any liquors before 1 P.M., or between 3 and 5 P.M. on Sunday, Christmas Day, Good Friday, or any fast or thanksgiving day. The hour for closing on such days is 11 P.M. Public-houses must also be shut every day in the week between the hours of 1 and 4 A.M.; certain houses, however, are allowed to be open later, and some even all night, by special licence, for the accommodation of printers, marketers, and other persons whose business requires them to be working during 'the small hours.'

As a check upon 'tippling,' the older acts on the subject having gone into desuetude, it was provided by an act of George II., commonly called the 'Tippling Act,' that no action should be maintained for any *debt* on account of spirituous liquors, unless the debt were *bonâ fide* contracted at one time, to the amount of one pound and upwards. The intention of the legislature was to prevent scores being run up, and it was assumed to be impossible for any one at a sitting to drink a pound's worth of spirit. So much for public-houses and wineshops.

To return to the subject of inns, with which this article set out: it may be said that besides being under the necessity of procuring licences, if they sell liquors, innkeepers, whether teetotallers or not, are under the following obligations. They *must* receive, and lodge, and entertain a guest who applies for admission, if there be available accommodation for him in the hotel, unless there be some reason, good enough to convince a magistrate, that he ought not to be admitted. Formerly, they were forbidden to use plate, but the prohibitory act—one of William the Third's—was repealed by George III. Innkeepers are responsible for the property brought to their house by guests, and if it be lost or stolen, or destroyed, even by other guests, the landlord is responsible, and must make good the loss. Until quite lately, the liability of an innkeeper was unlimited in this respect, and he would be liable to replace money, jewels, or other things, however valuable, and of whatever amount. Now, the landlord is not bound to replace anything exceeding the value of thirty pounds, unless his guest have told him that his effects are worth more. This applies only to personal effects; and the landlord is bound, in order to get rid of his common-law liability, to have a printed copy of the clauses of the Relieving Act hung up in his hall. The landlord may also require his guest to deposit with him for safe keeping any valuable effects for which he is to be held liable. If a horse were stolen from the hotel stable, or injured in it, its owner, lodging in the hotel, would be able to sue the landlord. The object of the old law was to prevent complicity on the part of the landlord with thieves and robbers, to induce him to get honest servants, and to take the utmost care of the guests who, through force of circumstances, were obliged to intrust themselves and their property to him.

The protection which the law affords to innkeepers consists in a lien upon the goods of their guests. All the goods belonging to a traveller staying in the hotel can be seized in default of payment of the bill; and the only way in which the items and charges in the bill can be disputed is by allowing the goods to be seized, and then having the question raised in an action of debt by the landlord, or of trover by the guest whose goods are detained. It is not competent to a landlord,

Digitized by Google

under any circumstances, to detain the person of his guest. An action of debt is the only means by which his claims can be satisfied, in the event of the property belonging to the guest in the hotel being insufficient to cover the expenses.

A PERFECT TREASURE.

CHAPTER XI.—THE BIRTH OF BRIGADOON.

THE appointed year passed by, and my novel was completed, revised, and corrected. The title of this work (more than which of it I do not intend to inflict upon the present public) was *Brigadoon*, a name which I flattered myself was original, and (it will be at least conceded) did not reveal too much of the nature of its contents. It was affectionately dedicated to Mrs Eleanor Blunt, but beyond that I was determined that she should have no connection with it; it was not to profit in any way by her influence, but stand or fall entirely on its own merits. I even declined to make use of her introduction to an eminent publisher, but sent him the precious manuscript myself, with a modest note. By return of post I received a civil reply, to say that *Brigadoon* had been received in safety, and would have the 'best attention' of the gentleman employed by Messrs Putforth in such cases; as though that great work were out of health, and needed medical advice. In about a fortnight I got the notes of its diagnosis—the 'Reader's' verdict. 'I have perused with great care, and very considerable interest, the manuscript entitled *Brigadoon*. It exhibits talent of no common order. Some scenes, especially that in which young Tarbarrel defies his grandmother, exhibit remarkable power; the humour is original and genuine; the pathos simple but touching.'

There were, in short, three pages of letter-paper, in a beautiful hand, eulogising my novel in this agreeable style; but the fourth page, like a lady's postscript, contained the pith of the matter. This complimentary gentleman therein expressed much regret that 'the present state of the book-trade, especially as respected novels,' prevented his being able to recommend Messrs Putforth to undertake the publication of the manuscript entitled *Brigadoon*.

I have no doubt the 'Reader' understood his business, and that this formula was the established one for rejection with the great house of Putforth. Perhaps it is even imagined that it 'lets down' an author easily, and makes him as content with a denial as the nature of things permits. But for my part, I would just as soon have been without this elaborate and ornate criticism, out of which came nothing at all.

Mrs Eleanor Blunt 'wobbled' not a little when she read it. 'Somewhere or other, I've got Messrs Putforth's verdict upon my own book—that which made my reputation, and Messrs Bindem's fortune. It is years ago now, but they build upon the same lines still.' She opened her great desk, and from one of its numberless pigeon-holes took out a bundle of faded letters. 'Ah, Marmy,' sighed she, 'what a history of a literary life might be compiled from what I shall leave behind me.—Here it is. No; that is one from the same firm soliciting the honour of "bringing out your next production;" a very different affair, indeed, of which I hope you will soon have an experience. Yes; this is it, with a frank in the corner: some connection of the house was an M.P. Old Putforth was himself alive at that time, and I have a very strong suspicion was his own Reader. Every publisher who is his own Reader, Marmy, has a fool to decide for him. Let us hear what he says: "I have perused with great care, and very considerable interest"'——

Here we both roared with laughter—indeed, we could scarcely get on with this remarkable document at all. It was almost a fac-simile of the letter I had myself received that morning, except that 'the scene in which young Tarbarrel defies his grandmother' was the scene between two other folks. In the fourth page, 'the present state of the book-trade, especially as regarded novels,' alone prevented the Messrs Putforth's undertaking the publication of the accompanying manuscript.

In spite of my disappointment, we had quite a merry afternoon over that letter. 'You see, my dear Marmy, you only suffer the common lot.'

'Or, rather, only like my betters,' said I smiling.

'Well, yes; my book was a better book by a long way than *Brigadoon*,' returned the old lady composedly. 'Still, yours has great promise, and they are wrong not to undertake it. We must strive to find wiser folks, Marmy—that's all. Perhaps we were wrong not to try one of the younger firms, which are always the more enterprising. You must not be cast down, even if you have many such denials. Remember Bruce and the spider; to which last genus it is said the publishers belong. Not, however, that I altogether endorse that statement. They do not always suck the blood of authors with impunity. I don't mean only because we generally disagree with them; they even lose money by us occasionally—they do indeed;' and the recollection, doubtless, of some transaction in which Mrs Eleanor Blunt had gotten the better of a publisher shook her plump frame.

Acting upon this experienced lady's advice, I sent *Brigadoon* to seek his fortunes elsewhere, and this not twice nor three times only. Never was the proverb, 'Better luck next time,' pushed to more extreme limits than in his case. 'The present state of the book-trade, especially as regarded novels,' was always the insuperable obstacle, like the black bar in Bradshaw, that prevented his arriving at publication. Once, indeed, in the case of Messrs Tyro and Tupkins, a firm justly celebrated for introducing young authors to the public, *Brigadoon* met with the most promising reception. Tyro liked him, and Tupkins was charmed with him. They even expressed their opinion that he would make a considerable sensation, and warmly undertook to bring him out. I was so delighted with their courteous epistle, that I honestly told them that money would be a secondary object with me, if the book should only appear in their

Digitized by Google

forthcoming list of 'new works;' but at the same time, as I had expended more than a year's labour upon it, I should expect a small pecuniary compensation, the amount of which I left to themselves. In reply to this 'gushing' offer, Messrs Tyro and Tupkins presented me with their best compliments, and the information that they never published anything at their own expense, but would make their terms, in my particular case, a hundred guineas down, and a written guarantee for the disposal of a hundred copies.

So *Brigadoon* returned to me for the fifth time or so, still in manuscript, although by no means in the same state of virgin purity in which he had originally left Hershell Point—its blots picked out with a penknife, its stains cleaned by india-rubber, and stitched together with the ribbon by the fair hands of Rosa herself. *Brigadoon* was now dog's-eared and dirty, and presented to the experienced eye most undoubted evidence of his having been a rejected manuscript. Yet, strange to say, with appearances thus against him, and when his parent himself had almost given up the hope of witnessing his début, a publisher was at last discovered. I have beheld many gentlemen of that profession since (some of whom I am proud to call my friends) —wise-eyed, benevolent-mouthed, and altogether prepossessing—but I never met with one who looked so like an angel as *at that time* Mr Percival Swete appeared in my eyes. Perhaps I should scarcely have believed in his existence had I not seen him in the flesh, which came about in the following fashion.

He had received poor *Brigadoon* in the usual course, and written to say that he approved of him; and with regard to business arrangements, as nothing was like a personal interview, and as he happened to have business down at Daisyport, which it seemed was my post-town, perhaps I would have the goodness to do him the favour of coming over on a certain day, and taking a chop with him at the *Bear and Pineapple*, when we could talk the affair over. The tone of his communication —so frank, so friendly, so different from anything I had hitherto experienced—took my heart by storm, and I accepted his invitation with rapture. My uncle gave me leave to try and persuade Mr Swete to visit 'the Point,' 'for,' said he, 'a man who writes like that must be a genial fellow.' I felt quite indignant with Mrs Eleanor Blunt for not coinciding in this rose-coloured view of my new correspondent. Mr Swete, said she drily, had not the best of reputations in the Row, and for her part she did not admire his plan of 'talking the affair over' with a young gentleman of eighteen. She hinted, in fact, that this was synonymous with talking *me* over, and exacted a promise that whatever agreement he should come to, should be expressed in writing. Whatever suspicion she contrived to arouse in my confiding bosom was, however, at once set at rest when I beheld Mr Swete himself. Instead of the bald-headed, benevolent man of substance I had pictured to myself, fifty years of age at least, and of ample girth, I found a young fellow, only ten years my senior, tall and slim, with a tawny moustache, and an impulsive, not to say off-hand manner.

'I like *Brigadoon*,' said he, after we had dined together; 'and I like you, Mr Drake. This interview is more satisfactory to me, and I hope to us both, than any amount of correspondence. We know one another now, and can trust one another. I will put your book at once in the hands of my printers, and you shall correct the proof-sheets; there will doubtless be a few amendments, but you will find my people very accurate in their work.'

Mr Percival Swete had made such constant reference to his 'people' during our brief interview, that I felt convinced he employed quite an army of subordinates, that his establishment was on a vast scale, and his publishing business—which he called his 'operations'—gigantic. A hundred pounds more or less would certainly be nothing to a person of his wealth; but still he had not even hinted at the price which he was willing to pay for *Brigadoon;* and I felt a delicacy in alluding to money-matters. On the other hand, I was bound to perform my promise to Mrs Blunt. 'With regard to the—the pecuniary remuneration,' said I hesitatingly. I had hoped Mr Swete would help me out here, but he only puffed vigorously at his cigar, so that I could scarcely see him through the clouds of tobacco-smoke. 'I should be content,' continued I, 'with a very modest sum. Still, I have worked hard at the novel; and'——

'Just so, Mr Drake,' interrupted my companion with a pleasant smile: 'the labourer is worthy of his hire. But in the case of an unknown author like yourself, the profits of a novel are so ridiculously small. In point of fact, I only undertake *Brigadoon* in the hope of securing your second attempt to achieve a reputation: I look to the promise rather than to the performance. I do not myself expect any immediate pecuniary return whatever.—You cannot be induced to take a cigar? Well, that taste will come in time; at all events, take a little more claret.'

'If it were only ten pounds,' observed I in desperation, for I felt that the subject was growing more delicate every moment, 'I should be quite content even with that.'

'My dear Mr Drake, you shall have your ten pounds with all my heart.'

I really felt quite ashamed at having begun to entertain a suspicion of Mr Percival Swete—ashamed, too, at having demanded a sum of money so extremely small that this millionaire had been unable, in mentioning it, to repress a contemptuous smile. I felt like a beggar to whom some great man was about to carelessly chuck a copper.

Mr Swete made no objection, although he looked rather astonished when I pulled out of my pocket a stamped document, with which Mrs Eleanor Blunt had furnished me, and requested (after filling in the space left blank for the amount with the words *Ten Pounds*) that he would subscribe his name to it. It was my assignment of the copyright of *Brigadoon* (to which, at Mr Swete's instigation, I added a statement that the work was original) for that very insignificant sum; though future events compel me in justice to add that I honestly believe he would have consented to have made that ten pounds fifty. However, I must not anticipate. We parted upon the present occasion with many avowals of mutual esteem; and although I could not persuade my new acquaintance to visit Hershell Point, he promised faithfully that he should keep that invitation in mind. It was not often, he assured me, that he commenced a professional connection with so strong a sense of personal interest as in my case. And under these happy auspices, and the superintendence of Mr Percival Swete's 'people,' *Brigadoon* was born.

CHAPTER XII.—BRIGADOON'S TROUBLES.

There is nothing, perhaps, more agreeable to a man's vanity than the revision of the proof-sheets of his first book. Print, like colour, flatters. Every idea, every description, every phrase appears in type to better advantage than in mere manuscript, though one's handwriting be ever so good and distinct. The reflection, too, that now, at last, these pregnant thoughts of ours are about to wing their way more or less throughout our favoured country, lighting the face of beauty with smiles, and drawing tears down the parchment cheeks of hardened attorneys, is a pleasant notion to entertain; and even if a little exaggerated, it hurts nobody. In sober seriousness, it is a very important matter; for the man who has once obtained publication for what he has to say, has got all that any man has a right to expect, namely, a fair hearing. He has voluntarily put himself upon his trial, and the public are his judges. Those advocates for or against him, the reviewers, may say what they please (and some of them make themselves dreadfully unpleasant); but even though they may obtain a verdict from their readers, the jury, it is sure, sooner or later, to be set aside by the bench, if it has been given against evidence. As a general rule, however, the judges and the jury are agreed. We may have retained (although that, by the by, is not very easy) the most eminent counsel for our defence, but the truth will come out in spite of him, and if we deserve it, we shall be condemned. Whether we are so or not, it is a most frightful thing for the gentleman in the dock to listen to the speeches for the prosecution. Never shall I forget the reading of those respectable periodicals which took unfavourable views of *Brigadoon!* If a disagreeable critique should befall me now, I should be able, to my own satisfaction at least, to lay my finger on the individual scoundrel who wrote it—actuated by the meanest of feelings, retaliation; but at that time, as I had certainly not a personal enemy in the world, with the exception of Sangaree Tannajee (whom I did not suspect of being a reviewer), I was debarred from ascribing these attacks to private malice. The effect of this course of study was something similar to lying in an ant's nest without one's clothes, nay, without one's skin. The only mitigation of my sufferings was procured from the application of the favourable notices, which were unhappily not so numerous. It was also a charm to place the three volumes of *Brigadoon* before me, and contemplate them in silence. While engaged in this agreeable occupation one day, it suddenly struck me that that ten pounds owed to me by Mr Percival Swete would be also a balm if I could get it. That enterprising publisher was perhaps of so delicate a disposition that he disliked to mention money-matters, but still it had been understood between us that that little sum was to be paid upon the birthday of *Brigadoon*.

I had a particular need for it—namely, to purchase a comfortable arm-chair for my uncle's bedroom; for, notwithstanding his feeble health, he would not allow himself any luxury of this kind; and I had looked forward in vain for some months to the pleasure of presenting it to him. So I wrote a few friendly lines to Mr Swete, to remind him, in a graceful way, that doubtless amid the pressure of his various gigantic operations, this little matter of the ten pounds had been overlooked.

In course of post, I received a well-filled envelope, which I concluded without doubt contained the cheque for the money, or perhaps two five-pound notes; instead of this, it contained two letters, one on perfumed note-paper, from Mr Percival Swete, and one on foolscap, and presenting a menacing aspect, from a stranger.

'MY DEAR MR DRAKE,' ran the former—'a very distressing affair to me (because I am sure it will distress *you*) has just occurred: you have, it seems (no doubt undesignedly) appropriated what the law considers to be as much another man's own property as his horse and gig—that is, the registered title of a literary work. Mr Snow Skinner (a most worthy person, I am bound to say) has, it seems, already published a novel entitled *Brigadoon*, and he considers, with some justice, that you have been guilty of a piratical act. With less reason, he is obstinately convinced that you have *intentionally* traded upon the success of his production (of the existence of which, by the by, I, like yourself, was profoundly ignorant), and he breathes slaughter and vengeance against you. What he threatens, as you observe, is an injunction in Chancery; a process which, if obtained, will not only prevent my selling another copy of your work, but will compel me to account to him for every copy sold. This, of course, is not my affair at all, since I hold a statement in your own hand that your work is *in all respects* original; but it annoys me upon your account exceedingly—not to mention that it is most disagreeable for a person of my position to be mixed up with the least suspicion of anything discreditable. My advice to you is, to compound the matter with all speed, since one never knows where law-expenses will end. I am bound to say that the sum which Mr Snow Skinner names as a discharge of the whole matter, and which will reinstate *Brigadoon* in the position of an original work as much as if this had never occurred, seems to me by no means unreasonable.—The weather is abominable in London, and I envy you the sea-breezes and clear air of Hershell Point above all things; but, alas, I am tied here by a variety of Immense Transactions, and cannot promise myself a holiday for months to come.—Always yours most faithfully, my dear Mr Drake, PERCIVAL SWETE.'

I felt like one in a nightmare as I took up the second letter, and I had to read its contents twice over before I could bring my mind to bear upon it. It set forth in legal language the charge of literary piracy which Mr Swete had described, and announced that the application for an injunction would at once be made to Chancery, unless a compensation should be offered by the offender of not less than two hundred and fifty pounds.

In my ignorance of all legal affairs, it seemed to me as if a criminal prosecution was impending, and that shame as well as something like ruin awaited me; for as to this 'by no means unreasonable' demand of two hundred and fifty pounds, how was it possible for me to get it paid, unless I should persuade this Mr Snow Skinner to accept my literary services for life as a discharge of the obligation, which was far from likely, judging from the assets which my talents had hitherto realised. Mr Percival Swete, by the by, had made no mention of that miserable ten pounds upon the *per contra* side of the account; but this was scarcely to be wondered at. Doubtless, Mr Snow Skinner would impound that little sum, to begin with,

Digitized by Google

before consigning me to a debtors' jail; for I would certainly go to jail, rather than permit my uncle to pay this money out of his already crippled resources. I did not dare, freighted with this evil news, to meet his kind worn face, but snatched up my hat, and set off at a sharp run towards Sandiford, with the intention of consulting Mrs Blunt, who, I now remembered, had always been opposed to my having any business connection with Mr Percival Swete. A suspicion of that agreeable gentleman's probity had now awakened in my own trustful bosom.

As I flew up the second zigzag, I met Rosa Glendell descending it. There was no possibility of my avoiding her, or I would have done so. She had never seen me otherwise than radiant with the hope which she herself inspired, and I was afraid that I should not now be able to hide my misery. 'My dear Marmy,' cried she with agitation, 'what *has* happened?'

'Nothing at all,' said I; 'I was only starting for Seaview Cottage. I have had a letter about *Brigadoon;* it is no great matter, but I wanted Mrs Blunt to advise me.'

'How thankful I am, Marmy! I thought, from your running out of the house at that speed—for I have watched you all the way—that something my father once told me about your dear uncle—— But there, it's not so; and yet you look so wild, Marmy, yes, and under that forced smile so sad. Is that letter really of no consequence?—only one of those detestable reviews which you persist in reading, although you know the bad effect they have upon you?'

'It's not a review, Rosa—it's something on business, which you would not understand;' and I strove to pass by her on my way.

But her light touch was on my arm, and her low sweet voice—a charm that I could not resist—whispered reproachfully: 'Marmy!'

'Well, dear?' said I.

'It is not well, Marmy, to evade me thus, when trouble is on your mind. If I cannot understand the nature of this misfortune, I at least can sympathise with it. When you have had good news, you have always shared it with me; and now that you have a sorrow, am I not worthy to bear half the burden? If not, truly you did right to absolve me from my promise to marry you, for you must have judged I would make but a fair-weather wife indeed.'

'Dearest Rosa,' said I, 'I desired to save you from the knowledge of this trouble as long as I could; but you shall read these letters, since you wish it;' and I gave them into her hand.

It did not tremble as mine had done when she had read them; and in place of being cast down, a bright light shone in her eyes, an assuring smile sat on her lips. 'It is only two hundred and fifty pounds at most, then, that we have to pay.'

'Only two hundred and fifty pounds!' rejoined I bitterly. 'You might as well say only two thousand five hundred, Rosa; my uncle could almost as easily pay one sum as the other; and when I come to tell him'——

'Which you must never do,' interrupted Rosa earnestly. 'Bad news, my father says, might kill him on the spot, Marmy; or at least,' added she, perceiving the agitation into which her words had thrown me, 'would do him grievous harm. There is, it seems, some complication in his malady—the heart is affected as well as the lungs; though, if nothing sudden or disastrous should occur, he may yet be spared to us for many years.'

'O Rosa, Rosa,' cried I reproachfully, 'why have you, you who talk of sharing sorrows, kept this from *me?*'

'Because it was my father's secret, Marmy, and not my own. If it had been better you should know it, he would have told you himself. It was a doctor's matter, with which I dared not meddle. But how glad and thankful I am that in your ignorance you did not inform your uncle of this claim, but resolved to consult Mrs Blunt first—although, you naughty boy, you ought to have thought first of me.'

'Alas, dear,' said I, 'it is but of little consequence; my uncle must needs know it sooner or later, for he will have to find the money.'

'He will have to do nothing of the kind, Marmy,' answered Rosa decisively, 'for I'll lend it you myself.—What! you think I have not got it? But I beg to say I have, sir. If you have fallen in love with a young person without due inquiry into her circumstances, that shews how imprudent you are, although it is true it acquits you of having mercenary views. You have chanced unaware, sir, upon an heiress' (and I am sure if she had been a real one she could not have looked more pleased). 'I have three hundred pounds or so, all my own, which I became possessed of on my eighteenth birthday. An admirable godmother, of whom, however, I have not the slightest recollection, left me one hundred and fifty pounds when I was an infant in arms, to accumulate. And it has accumulated, dear Marmy, and oh! I am so glad to—to—have the opportunity of becoming your creditor. I am quite sure papa will consent, and then your dear good uncle need never know anything about the matter. You see it will be quite a business transaction,' continued she with gravity, 'and I shall only invest the money in you, as it were, and exact interest at quarter-days, or whatever they are called.'

I daresay it was wrong, but I was a child of impulse, and I could not prevent myself from clasping this charming creditor to my heart, and giving her a kiss, by way of interest in advance.

'That will do, Marmy,' said Rosa, disengaging herself demurely; 'and I only forgive you, sir, because I conclude that such is your way of sealing a bargain, although I doubt whether it's usual in the city.'

'No, my dearest Rosa,' said I gravely; 'it is *not* a bargain; I could not possibly take your money, although I love you more than ever.' She looked so pained and grieved, that instead of thanking her, as she seemed afraid I was about to do, I added smiling: 'O yes, a great deal more, now that I know you are an heiress. But what would Mrs Blunt say, when she came to hear that I begin to be independent, and to shew myself capable of maintaining a wife, as well as myself, by borrowing money of *you?*'

'That is so like an Englishman,' said Rosa scornfully; and it was the first time and the last that I ever knew her voice to have a bitter tone. 'You are so proud, that you would die sooner than incur an obligation (as you call it, I suppose) which involves pounds, shillings, and pence, from a woman. I tell you that I see neither nobility nor spirit in such conduct, Marmy, but only a cowardly fear of your Mrs Grundy.'

'That is not spoken like yourself, dear Rosa,'

Digitized by Google

said I tenderly; 'though it's true I do fear Mrs Grundy in a matter like this, wherein you are concerned as well as I.'

'And do you not fear to risk the life of your uncle? If you have no love for me, you will have some consideration for him, I conclude.—There, you see I am right, Marmy. I was only angry because I could not persuade you: you forgive me, don't you?'

'Yes, I forgive you, dearest; but I must take time to think about this, and must ask advice from those who are wiser, who are not all mere goodness, where money is concerned, as you are;' and so, having kissed away my Rosa's tears, and comforted her all I could, I went upon my way to Sandiford.

Mrs Blunt received the terrible intelligence I had to give her with astonishment, tempered by philosophy.

'I thought I had lived too long in the world, my dear, to be surprised at anything; but really your friend, Mr Percival Swete, is a scoundrel without a parallel.'

'You think, then, the claim which he recommends me to satisfy is not altogether a *bonâ-fide* one?'

'I am perfectly certain, Marmy, that it is a gigantic swindle; but the question is, how far the law encourages it. I have no doubt there is some trashy book in existence of the same name as your novel, and I have a shrewd suspicion that that very circumstance was what made Mr Swete so anxious to publish *Brigadoon* for *you*. He had this scheme of extortion in his mind from the first moment you offered him your novel. He came down to Daisyport, and gave you that nice little dinner with the object of finding out certain matters which he could not discover by letter: whether you were as young and inexperienced as you represented yourself to be, and particularly whether you, or rather your friends, had any money. He satisfied himself on the first point easily enough, and your uncle's invitation perhaps made him believe that he was a person of substance. Doubtless, too, you did not give him to understand that the ex-maharajah was otherwise than a country gentleman living on his own estate.'

I coloured to the roots of my hair, for I certainly remembered to have made the best of Hershell Point (as some set-off against his 'people' and the gigantic character of his 'operations'), when speaking of that residence to Mr Percival Swete.

'Yes,' continued the old lady thoughtfully, 'the whole affair is what these thieves would call in their own dialect "a plant." Of course there are numberless rogueries in literature, as in everything else, Marmy, but to Mr Swete belongs the credit of having invented a new one. It did puzzle me a good deal to hear of his readiness to sign that agreement, but now it's all explained. He might have promised to pay you a hundred pounds quite safely, since he had only to add it to this present claim to recoup himself.'

'Such dishonesty cannot surely prosper,' said I, driven by the thought of this perfidy to platitude and proverb. 'I should not be the least surprised to hear some day of his being bankrupt.'

'*No more* should I,' observed Mrs Blunt drily: 'it would not be the first time nor the second that Mr Swete has experienced that calamity. But, upon my life, it is infamous,' cried the old lady indignantly, 'to trade upon the innocence of a lad like this; and if my Mr Moulden can give him a rap over the knuckles, he shall have it.'

'My Mr Moulden' was one of those pet lawyers which (as well as a pet doctor) every literary person of eminence always possesses, and Mrs Eleanor Blunt had the utmost confidence in his sagacity and discretion. She wrote to him, accordingly, by that day's post; and bade me take no steps at present (which was easy enough), and not to trouble myself in the meantime about the matter—which was very difficult. Under these circumstances, and partly, perhaps, because of that pride of which Rosa had accused me, I made no mention of my darling's offer to give up her little all to feed the maw of that worthy man, Mr Snow Skinner.

A MODERN ALPHABET INVENTOR.

A FEW months back a paragraph in the *New York Tribune* stated that a literary relic had been sold in that city for the sum of eleven hundred and thirty dollars—the highest price any book has fetched in that country. It was a copy of Eliot's *Indian Bible*, a book that no man living can read. Eliot was a Puritan Englishman, who emigrated to New England on account of his religious opinions, and died at Roxbury, where a handsome memorial was erected to his memory by his admirers.

This brought to my recollection the labours of another ingenious mind, known by the name of George Guess among the people of the United States. He was an Indian, and his name See-quo-lah. If ever a record of patient industry, untiring perseverance, and natural ingenuity deserves record, it is this. Eliot's Bible was in Mohegan, with the usual Roman letters, with different signs to denote the different inflections of sounds. But See-quo-lah invented an alphabet for the use of his tribe. His idea originated in the early French and Indian wars. The Cherokees had a white prisoner on whose person they found a letter; to satisfy his capturers, the prisoner had to read it for their edification. But of course the tenor of his reading differed greatly from what he pretended to read from. The 'talking leaf' had ever been a mystery to these untutored minds of the prairie. They had long considered it a gift of the Great Spirit, and held it in great veneration. But See-quo-lah, then a youth, knew better; he maintained that it was purely man's invention, and the desire to have a written alphabet for his tribe possessed him. For a long time the idea lay dormant, the migrations of the tribe or their predatory excursions left him no leisure. But lamed, and as it proved, for life, the long hours of his forced imprisonment brought forth the old idea. His first attempt was to gather all the sounds of the Cherokee tongue; but the result was far from encouraging. He collected above two hundred. His next difficulty was to place a sign as equivalent to a sound. Like the old Egyptians, and probably like the first alphabet inventors, whoever they may be, he made use of hieroglyphics. He embodied pictures of birds, beasts, &c. which approximated with the sounds, and served best as a representation. But the mind, before it could realise such a category, would require an immense amount of training. He looked over the extensive

Digitized by Google

list with some dismay, and endeavoured to modify it. He was successful enough to abbreviate it to eighty-six. He was able to accomplish this, because in Cherokee all syllables have a vowel ending. An enumeration and classification of these syllables made, and a sign for each would complete it. Thus there needed no distinction between vowels and consonants. A rather unwieldy affair, no doubt; but when the system was learned, easier to spell by, than by using Eliot's method. The longest word of this system contains but fourteen signs or syllables, while the longest words of Eliot's have often over thirty.

It took the ancient world ages before it could entirely discard the picture-signs for letters. The idea of simple letters stole on imperceptibly, and is enveloped in inexplicable mystery. But this poor Indian at one stroke discarded his picture-signs, and invented an alphabet almost as commodious as those of European nations. His next difficulty was to make so many signs dissimilar to each other. Perhaps he might have seen some English printed matter, for some of his signs greatly resemble our letters. The figure 4 is prominently used. Some signs are like Greek or Asiatic letters, others like Slavonian. But they have a far different sound from their prototypes, if such they were. The sign S sounds like *thu*, M like *lu*, and the rest are equally different. But most of them are pure inventions. All are used over again in different postures, so to speak—distorted, inverted, or abbreviated.

His pen was a nail; he wrote on bark. Eventually (about 1825) he obtained a pen and some paper from one of those frontier traders, but the pen was carefully preserved as a guide to manufacture others by. His ink he made himself from barks. His first pupil was his daughter.

But, like Roger Bacon, Gutenberg, Galileo, and others, his neighbours suspected him of practising the black art. Doubtless he seldom left his hut; his mind being in his work, his time would be taken up with it. His tribe shunned him; but his inoffensive, as well as his pitiable condition preserved him from any dire consequences. He was told that they would see the fruits of his labours before they judged too harshly. The following year he brought his invention before the sachems of the tribe, causing his daughter to write from his dictation in an adjoining apartment, and *vice versâ*. The tribe were astonished; and after a little wavering, and his assurance of using no supernatural powers, they allowed him to instruct some of the youths of the tribe. After several months' interval, the youths were brought forward, and, amid great popular excitement, were tested and examined in as many ingenious ways as the cunning Indians could suggest; but the youths proved themselves masters of the new art.

His discovery led to the printing of the New Testament in the Cherokee language: in 1825, the United States cast a fount of type from his invention, and even printed a newspaper from it (*The Phœnix*). The capitals differ from the small letters only in being made a little larger. The missionaries brought in the use of Arabic numerals, although See-quo-lah had invented numerals to correspond.

He afterwards expressed his regret that his invention should have been promoted to undermine the principles of his Indian religion. He never became a Christian. When his tribe were obliged to move out of Georgia, he accompanied them to their new home in Arkansas. We next hear of him in Northern Mexico, and then at San Francisco, where he died at the age of seventy-eight, in August 1843.

THE SECRET IN THE AIR.

Not a leaf is on the beech, not a blossom on the elm;
And all the green is in the grass and in the velvet moss;
For the hues of livid purple e'en the ivies overwhelm,
And the willows that are first brown and barren branches toss.

But a secret in the smiling air, whose breezes come and go,
Doing service unproclaimed upon the hill and in the vale,
And the gaiety and force that are beating to and fro
In the swarms of little winglets, seem to hint a pleasant tale.

Yes, the flowers under earth, and the leaves within the bud,
Must be waiting for the promised change of sunny life to come;
Must be waiting like the children that with spirits on the flood
Are all eager for the mystery that gathers them at home.

The clouds have covered heaven, but they cannot shed a gloom,
Though not a ray of shining gold doth slant upon the earth;
And the air is more transparent, and they wear a whiter bloom,
And everywhere, but half-suppressed, there lurks a well of mirth.

The branch hath ta'en a softer brown, the bud a richer black,
The note of birds is rounding into sweeter swell and power,
Earth and Heaven both are listening to far steps upon the track
That leadeth toward their winter-withered, leaf-abandoned bower.

And lo! a joyous leaping in the rosy springs of life,
And the South's caressing kisses on the cheek, and eye, and brow,
And the ankle as if winged, and the limb with vigour rife,
Make the bosom light with pleasure that the Spring is coming now!

CO-OPERATIVE AGRICULTURAL SOCIETIES.

IT is a common belief that the successful enterprise of the 'Rochdale Pioneers' was the first practical embodiment of the co-operative principle in England. It seems, however, from the Report of the Rev. James Fraser, one of the assistant-commissioners in the inquiry now being made into the employment of women and children in agriculture, that this is not really the case. So far back, it would appear, as the year 1830—that is, fourteen years before the commencement of the Rochdale scheme—the idea occurred to a Suffolk gentleman, Mr Gurdon, of Assington Hall, to try whether the principle of copartnership could not be successfully applied in the cultivation of a farm. He therefore selected a piece of his own land, of about sixty acres in extent, of average quality, and at once formed his small band of co-operators. He selected the first members of his Assington Co-operative Agricultural Society—fifteen in number—exclusively from the class of agricultural labourers. Each of them put L.3 into the undertaking by way of 'subscribed capital;' and in order to enable the company to stock their farm, Mr Gurdon lent them the sum of L.400 without interest. The undertaking has prospered greatly ever since its commencement. The shares are now of the value of L.50. The loan of L.400 has been repaid. The number of acres in occupation by the Society has been increased from sixty to one hundred and thirty, and the shareholders from fifteen to twenty-one.

The dividends of the Society—like those of more pretentious companies—have fluctuated since its establishment, but every year there has been some profit to divide. In addition to the repayment of the loan of L.400, the company have stocked their farm with six horses, four cows, one hundred and ten sheep, and from thirty to forty pigs—all which are their own property. The land is farmed by five men, and two or three boys. When a member works upon the farm, he is paid wages at the same rate as those which would be paid to an ordinary labourer. A committee of four are charged with the management of the farm—two of whom retire each year. The practical direction of the farm, however, is in the hands of the farm-bailiff, who is himself a co-operator, but he receives wages from the company in the same way as any other labourer would do. No member is allowed more than one share in the Society, and only labourers of the parish are allowed to hold shares. If a man, therefore, goes to reside more than three miles from Assington, he is obliged to dispose of his share. When a new member is admitted into the Society, he pays down L.5 as a deposit for his share, and the remainder of the current value by instalments. The premises are kept in repair by the tenants, are insured for L.500, and every twelve years are revalued. A member who may need it, can have a loan advanced to him up to one half of the current value of his share—a privilege which has, however, been rarely used. All the voting in this Society, it is interesting to notice, is by ballot.

After twenty-four years of trial, Mr Gurdon's first experiment had succeeded so well that he was encouraged to try a second one. In 1854, he therefore commenced the 'Assington Co-operative Agricultural *Association*.' This enterprise began with seventy acres of land, and thirty-six members—each subscribing L.3, 10s. by way of 'paid-up capital.' Mr Gurdon again shewed his liberality by lending to the new Association the sum of L.400 without interest. During the fourteen years which have now elapsed since the establishment of this second Co-operative Society, it has prospered so much that its members have been enabled to repay the loan of L.400 to Mr Gurdon, and have also taken in additional land, and stocked it. They now occupy two hundred and twelve acres, at a yearly rent of L.325. They are quite out of debt, and the stock of the farm (which is entirely their own property) is valued at L.1200. The original shares of L.3, 10s. now sell freely for L.30. In consequence of the profits of the Society having been

Digitized by Google

devoted to the repayment of the loan of L.400, and to the taking in and stocking of so much additional land, the surplus which has actually been divided amongst the members has not been large, but it will readily be seen that the prospects of this Association give promise of a very successful future. These two societies are not yet incorporated, but they intend to become so. It will be observed that the only exceptional privilege which these Assington societies have enjoyed has been that of the loan, *without interest*, of the money wherewith they were enabled to stock their farms, and in both cases this loan has been paid back. In the case of the second Society, the members are not restricted to the class of agricultural labourers. As a matter of fact, however, all but six are taken from that class—the employments of the six excepted ones being one miller, one blacksmith, one shoemaker, one wheelwright, and two joiners. The advantages of societies like these at Assington in inducing provident habits amongst agricultural labourers, in decreasing pauperism, and in giving their members an interest in the soil, and through it, an interest in their common country, are obvious. The only valid objection to them is that, if they were established generally throughout the country, they might tend to the extinction of the small tenant-farmers. The same objection is, of course, urged against co-operative stores in towns—namely, that *they* tend to sweep the small shopkeeper from off the face of the earth. It is very doubtful, however, whether the co-operative principle will ever be so widely acted upon as to lead to these results.

The successful results of the co-operative principle, as applied to farming in Assington, led to the establishment there in the year 1863 of a rural co-operative store. It is called the 'Assington Industrial and Provident Society,' and originally started with thirty-six members, but it now numbers eighty-eight. The shares are of the value of L.1, and each member is expected to hold five. Interest at the rate of five per cent. is allowed to each shareholder on his capital, and the balance of profit is divided amongst the members who are purchasers, in proportion to the amount of their purchases. The amount of members' purchases in the September quarter, 1867, was L.660, and of non-members, L.45. Credit is not given to non-members, nor to members beyond the value of their shares. If, at a division of profits, a member does not choose to take his share in money, he can have it added to the amount of his capital. The average dividend last year on the amount of purchases was at the rate of about 5½ per cent. per annum. The establishment consists of a manager, his wife, and a shopman, who receive weekly salaries of 14s., 3s., and 8s. respectively. The store is managed by a committee of shareholders, is registered, and is conducted under a code of rules which has the sanction of the Registrar of Friendly Societies in England.

Upwards of sixty of the shareholders are agricultural labourers, and they have—the manager of the store testifies—'been very much bettered in their condition thereby.' Many of them say that they 'have no call to look after their rent now,' as its amount is almost made up out of their dividend on capital and purchases.

Another rural co-operative store flourishes in the village of Tortworth, in Gloucestershire, under the auspices of Lord Ducie. That nobleman has himself described the success which the Tortworth experiment has met with in a very able letter which appeared in the *Times* of April 9, 1868. It appears, from that communication, that in March 1867, about twenty of the most intelligent men in Lord Ducie's employment met and agreed to attempt a co-operative store for groceries. Nearly L.50 was subscribed by them on the spot as share capital, and a committee was elected. Suitable accommodation was easily provided, rough shop-fittings were extemporised, stores were purchased, and in a few days sales were begun. Ready-money payment was enforced from the first commencement of the store. The committee was composed of persons of various grades, including day-labourers. A carpenter, working half-time at his trade, and giving his afternoons and Saturdays to the store, with the occasional assistance of a school-boy as clerk, was found sufficient to carry on the business. The weekly supervision of the committee, which meets in the store itself, has kept the supplies well up to the demand. The goods are sold at the ordinary shop prices, and at the end of every quarter a division of profits is made among the purchasers. Shareholders take double the profit of non-shareholding customers, and receive in addition five per cent. per annum on their paid-up share capital.

The London co-operative stores which sell articles at a low price, and retain only a sufficient profit to meet the ordinary expenses of management, are no doubt well suited to the needs of the class by whom they were instituted; but the store at Tortworth seems no less adapted for the circumstances of an agricultural district. The system of quarterly dividends, it will be seen, insures at least a quarter's savings. Lord Ducie's account of the astonishment of the Tortworth labourers at finding themselves 'in the novel position of capitalists' is most amusing. 'Labourers,' writes he, 'are astonished to find that whilst they have been receiving their goods at the usual prices, and of a better quality than formerly, a fund has been mysteriously accumulating, which is their own, and which is large or small in proportion to the extent of their purchases. A man with a large family,' adds his Lordship, 'and whose expenditure on the necessaries of life is consequently large, thus finds a new light thrown upon the text which assures him that happiness is among the possessions of the man whose quiver is full of young children.'

The total sales for the year ending March 23, 1868, have amounted at this Tortworth store to the sum of L.1648—a sum far beyond anything which the wildest dreams of its original promoters ever led them to anticipate. The occupations of the shareholders at the end of the first year were as follows: labourers, 25; carpenters and masons, 11; tradesmen, 9; farmers, 6; gardeners, 6; clergy, gentlemen, domestic servants, and various occupations, 16. Large purchases have also been made by non-shareholders receiving only half-profits. The sales at the store were, for the first quarter, L.320; second, L.349; third, L.468; fourth, L.511. The dividends to the shareholders were, in the pound expended, for the first quarter, 3s. 4d.; second, 2s. 9d.; third, 3s. 2d.; fourth, 3s. 6d. Lord Ducie cites, in his letter, the following 'typical cases' of the accounts at the end of the

Digitized by Google

year of three labourers who all joined the store at its commencement:

	Paid-up Capital.	Dividend on Money Expended.
A	£1 0 0	£5 0 7
B	1 14 10	2 10 0
C	0 19 3	3 17 0

All these men earn 12s. each per week. The difference in the amount of their dividends arises from the different amounts expended by each. A, for instance, has a large family, some of whom add to the common purse; his purchases have thus been large, and the result is that he receives a dividend which much more than pays the rent of his house and garden. These men have also received five per cent. upon their paid-up capital.

So successful has this Tortworth store been during the first year of its existence, that the committee have now added to it a drapery branch, and have expended L.230 in stocking it. They have also determined, it seems, to pay their salesman two and a half per cent. upon his sales, in lieu of a fixed salary, and have secured the whole of his time. They have, moreover, resolved to pay their committee-men sixpence each for every attendance, 'a humble extravagance which,' remarks Lord Ducie, 'will contrast favourably with the practice of more ambitious institutions.' The concluding sentences of his Lordship's letter to the *Times* are so sensible, and state so admirably the advantages to be derived from the establishment of rural co-operative stores, that we shall take the liberty of transcribing them in full. 'I trust,' says his Lordship, 'that I am not over-sanguine in attaching much importance to this movement. I do not expect the renovation of society by means of cheap groceries; but when country co-operative stores can be established, I do look for a more thrifty population, better supplied with better necessaries of life, and deriving a certain advantage mentally from the interest which they learn to take in the small commercial experiences which are thrust upon them. I believe, also, that a landed proprietor will benefit both himself and his dependents by encouraging the movement, and that a clergyman who will assist and give his parishioners the advantage of his superior intelligence in their attempts at self-help, will not transgress the bounds or the duties of his office.'

One feature of difference, it will be observed, between the Tortworth and the Assington stores is, that at Tortworth non-members are allowed a share of the profits. Mr Fraser, in his Report, to which we have already referred, suggests that if rural co-operative stores would everywhere follow the practice of the Assington store in selling wholesome beer at a moderate price, 'to be consumed off the premises,' their doing so would tend greatly towards the extinction of drunkenness, because men would then buy no more beer than they actually wanted, and would, moreover, drink it at home with their supper, instead of sitting boosing in the village public-house.

These experiments at Assington and Tortworth conclusively shew that, without any assistance from government or any extraneous aid whatever, co-operative stores can be successfully carried on even in purely agricultural districts. All that is needed is for some intelligent and public-spirited person—the clergyman or squire of the parish, for example—to take an interest in the matter, and the thing is done. The advantages of these co-operative stores in enabling agricultural labourers to procure cheaper and better articles of food; in encouraging in them thrifty habits; in uniting them together by the bonds of a common interest in a common cause; in increasing their business habits; and in teaching many of them, absolutely for the first time in their lives, to *think*, cannot be too strongly insisted upon. It is therefore to be hoped that the day is not far distant when every village throughout Great Britain will have its co-operative store—possibly also its co-operative farm. If the same wisdom be shewn in the management of these new enterprises which has been so conspicuously displayed at Tortworth and Assington, there can be no reason why they should not meet with the same measure of success.

A PERFECT TREASURE.

CHAPTER XIII.—THE RETREAT IS SOUNDED.

After an interval of ten days, which seemed to me as many weeks, the admirable Mr Moulden exhibited another proof of his infallibility by the following letter:

My dear Mrs Blunt—I have got to the root of the matter of the two *Brigadoons* at last, although in no case should I have advised your protégé to give one sixpence in compensation for imaginary damage. It is quite true that Mr Snow Skinner did once favour the world with a work of fiction bearing the title in question. But if Mr Percival Swete was not aware of the fact previous to his little business transaction with Mr Drake, it shewed (in so genial and warm-hearted a gentleman) a very remarkable want of interest in the affairs of his relatives—*for Mr. Snow Skinner is Mr Swete's half-brother*. As the latter and I happened to be alone when I had the pleasure of reminding him of this circumstance (the knowledge of which it caused me infinite trouble to attain), I treated myself to a very free expression of opinion upon the whole affair. Of course he saw that the game was up at once; but I am bound to say that a more imperturbable and philosophic vagabond was never beheld. The only thing that moved him was my imperative demand for that ten pounds (which I have the pleasure of enclosing) that he promised to pay for the copyright. It was like drawing a badger. I doubt whether he ever paid anybody any money before. He excused himself upon a variety of grounds, one of which was, that Mr Drake had solicited him most urgently to become his publisher. 'He *courted* me, Mr Moulden, I do assure you.'—'Well, sir, and if you don't pay,' replied I, 'he will now County Court you;' which I think was rather a neat reply. By means of that retort, to speak chemically, I distilled the gold.—Yours always, dear Mrs Blunt, with affectionate admiration, Geoffrey Moulden.

The receipt of this letter put us all in the highest spirits, and its contents enabled me to purchase the long-wished-for arm-chair for my dear uncle. Indeed, it was but too plain that he needed every comfort, although he would not admit that there was much the matter with him. The ex-maharajah still looked the grand old soldier; but it was only to outward seeming: he was like a stately castle, the walls of which are undermined, and might topple to the ground at the least shock. From being always with him, we did not, however,

Digitized by Google

perceive any particular cause for alarm; and he did his best to prevent our doing so. He disliked to see the least evidence of trouble on his own account, and, indeed, resented it, except in Rosa's case. It was astonishing how cheerful and animated he became under her influence, and how he lost his old habit of taciturnity. Many a vivid scene of Eastern adventure, which would else have lain for ever locked up in his memory, did the young girl evoke; only, as before, he never spoke of Tannajee, and but very rarely and incidentally of the Begum of Bundelbad. I think, since Rosa's advent, he became embarrassed when alluding to his relations with that august princess, although we were very curious to hear of them. Mr Glendell, however, on one occasion—and I shall never forget that evening, for it was the very last our little company ever passed together—ventured to inquire respecting the Begum's views upon religious matters.

'The religion of the state,' replied the ex-maharajah, avoiding this home-question, 'was unhappily idolatry; but the Bundelbadians did not grow their own gods—they imported them from China. I have got an invoice somewhere of a consignment of deities from Canton;' and my uncle, who coloured a little, as if ashamed of this transaction, began fumbling some papers in a drawer. 'You see, Glendell, I was a stranger in the country, and had no public influence whatever; it was my duty, when treasurer to Her Majesty's household, to docket all the bills, and this invoice passed through my hands as a matter of business. I thought I had it somewhere here; but I daresay it has been used for lighting cheroots.'

'But what is that printed document I see, like what is stuck on tea-chests?' urged Mr Glendell.

'Oh, that is merely the advertisement of our Canton idol-maker. I cut it out of the Chinese newspaper, at Her Highness's request, in case we should forget his address;' and my uncle carelessly closed the drawer, and sat down.

'Could you read Chinese, then, dear Mr Braydon?' inquired Rosa.

'No, my dear young lady.'

'Then what was the use of your keeping the advertisement?'

'Well, the fact is, there is a translation appended in English.'

'I should very much like to hear it,' said Rosa hesitatingly.

'There is no harm in your doing so,' said my uncle: 'it is a curious trade-document, that is all.—Read it, Marmy.'

And I read it accordingly.

'I, Achen Tea Chinchen, a lineal descendant of Coupe Boi Roche Chinchen, the celebrated sculptor and carver in wood, who, through his unremitting studies to promote rational religious worship, has been honoured with the commands of emperors, kings, and rajahs of the East, and supplied them with superior idols for public and domestic worship, now humbly offer my services in the same theological line; having travelled at a vast expense, and perfected myself in anatomy, and in copying the most graceful attitudes of the human figure under Nollekens and Bacon. A. T. C. is ready to execute to order idols from twelve feet high, well proportioned, down to the size of a marmoset monkey, or the most hideous monster that can be supposed to inspire awe and reverence for religion. My charges are moderate: For an Orang-outang, three feet high, 700 dollars; ditto, rampant, 800; a Sphinx, 400; a Bull with hump and horns, 650; and an Ass in a braying attitude, 850. The most durable materials—granite, brass, and copper—will be used. Perishable wood shall never disgrace a deity made by my hands. Posterity may see the objects of their fathers' devotion unsullied by the inclemencies of the seasons, the embraces of the pious, or their tears. Small idols for domestic worship, or made into portable compass for pilgrims. Any order post-paid, and accompanied by a drawing or description of the idol, will be promptly attended to; provided that one-half of the expense shall be first paid, and the remainder secured by any respectable House in Canton.'

What merry laughs we had over Mr Chinchen's circular! How reluctantly was the ex-maharajah induced, by the doctor's wiles and Rosa's smiles, to narrate the wonders of Bundelbad; and how charmed we were with them. Our guests did not take their departure till hours which, considering what 'the Point' hours usually were, might be called 'small:' they left us about half-past ten o'clock.

I was gaily congratulating my uncle upon his talents as a *raconteur*, and on his improved looks, when I saw him, upon a sudden, turn quite white—whiter than I should have thought it possible for his bronzed cheeks to look—and put his hand to his side, as if in pain. 'It is nothing,' said he, with a smile that was meant to reassure me; 'a mere passing faintness, that is all.' He would not hear of my running out to fetch back Mr Glendell; nor would he retire to bed. 'Make up the fire a little, and let us talk, Marmy.'

'My dear uncle,' urged I, 'this is not right; you have had talking enough and to spare for to-night. Why, in all my life, I have scarcely heard so much from you of your Indian experiences as within the last few hours.'

'Nevertheless, Marmy, I must say a few words more.—Is Tannajee gone to bed?'

I went softly to the Hindu's chamber, and found him snoring heavily. Perhaps he was *dreaming* of sitting up for his master beyond the usual hour, but he certainly never *did* it. He was as useless in the house as any log; but ever since that interview between us in the study, he had ceased to be insolent in his manner. It was indeed observed on all sides what an improvement had taken place in him; and on that slight ground—such is the advantage of habitual ill-humour and misconduct—he was even quite in favour with the cook.

'My dear lad,' began my uncle gravely, 'if I were to die this night, the only regret I should have would be in leaving you so ill provided for.'

'That would be *my* least cause of regret, uncle.'

'I do believe you, Marmy. And I, on my part, love you so that I do not repent of my selfishness in having kept you near me, though you might have done much better for yourself away from home.'

'Your selfishness, uncle?' I took up his large brown hand, which was far thinner than it used to be, and reverently kissed it. Young as I was, and in love with life, I would have sacrificed my own existence to have eked out his, and, thank Heaven, he knew it.

'I have had a happy time here at the Point,

Digitized by Google

Marmy, thanks to you; happier than ever I expected; more peaceful than I ever deserved. Yes, yes; you do not know what my life has been. I am thankful to think you have no idea of such things. But God is merciful. If He chastens us here, it is only for our good hereafter.' And again he pressed his fingers to his side.

I was alarmed by this action; but much more so by his words and manner, which were such as I had never known him use before.

He went on to speak of death and judgment in words I shall not of course reproduce here. It was plain to me that if he had never talked of such matters before, he had long had them on his mind. He spoke with reverence and humility. 'I hope,' said he smiling, 'that I shall not be weighed against men like good Mr Glendell, but that allowances will be made for an old soldier. But enough of myself, Marmy. If I were to die to-night,' repeated he, 'there are but fifty pounds in the world for you to keep house upon. In trying to better ourselves of late, I have made matters much worse. I drew the last shilling I had at the bank out yesterday; and it all lies in my desk, with that Packet you wot of. When you have read its contents, you will take counsel of your own mind—for my word is pledged for you, Marmy, to conceal the matter. As to whether you wish to stay at the Point, where your great attraction lies—— O yes, dear lad, I know all about that, and I love her as though she were my own child. Dear, dear Rosa!' And to my wonder, or, I may say awe, I saw the large tears rolling down my uncle's cheeks. 'To have seen you two made one, Marmy, would have been too great a joy for such as I have been to witness; but perhaps, in time, it may be so. Yet do not risk her happiness by wedding on mere Expectations: you will know what I mean when the time comes. Fifty pounds, as I was saying, is all that is now left from the sale of my Indian jewels; but the Point and the ground about it, if you choose to dispose of them, will fetch some twelve hundred pounds; or you can raise a part of that sum on mortgage, and keep yourself here by your pen. It is best to trust to yourself, and calculate on no contingencies. Still, as you will have learned by the time I speak of, you may be one day a rich man. You will then remember the *poor*.'

My uncle's charity, considering his circumstances, was boundless; and every aged woman and sick child in the village blessed his footfall when they heard it at their doors. The parson of the parish, of which our hamlet was but an outlying district, with no church, used to call him the curate of Hershell.

'I will endeavour, uncle, all I can,' returned I, 'to imitate your example.'

'No, no, Marmy; not mine, but Rosa's. She is always good and wise. It is that you may secure her for a helpmate, I wish, most of all, that you may inherit what I have missed.—Listen, Marmy. Is the door fast?—I am not going to divulge what I have promised to conceal, but I may tell you this much: your future prosperity depends upon the Hindu. He is a bad man; and he does not like you, Marmy. Still, you will have a hold upon him. He must never leave your service. If he does so, pursue him to the ends of the earth; and recover him, Dead or Alive. Yes, *Dead* or *Alive*. The reason will have been explained to you in that writing after my death; but in the meantime, if I were to become ill and helpless, look to this. Tannajee has been on his good behaviour lately, and that is a bad sign. I could not run after him now across the downs,' said my uncle, with a sad smile, 'and bring him back by the scruff of his neck.'

'I, however, can do so,' observed I with significance.

'Yes, I think he's somewhat afraid of you now, Marmy; and that is no bad thing.—But there is another danger, to which you, who are yourself in love, ought not to have been blind: Tannajee is courting Martha.'

Ill as my uncle was, I was astonished at the gravity with which he made this announcement. For myself, I could not help laughing outright. True, I had observed that Martha and the Hindu had of late been very gracious towards one another; but I thought I knew the cause. 'Why, until within these last few months, my dear uncle,' reasoned I, 'those two have been like cat and dog. Why, he's almost a black man, and besides, our cook is quite an old woman!'

'That's the danger,' said my uncle with seriousness; and I am quite sure that his mind was then reverting to the princess who even to so late a period of life had evinced her partiality to Europeans. 'When a woman gets to her age, she is not particular about the colour of her husband.'

Since our prosperity depends upon Tannajee, thought I, we are in a manner his heirs, and supposing he married Martha, and had offspring, that would invalidate our claims. But I was not at all apprehensive of this danger, and perhaps the idea of it awoke a smile.

'It is no jesting matter this, Marmy,' continued my uncle earnestly, 'as you will understand some day. But this marriage must not be. Indeed, Tannajee has solemnly promised to remain a bachelor.'

'Then make yourself quite easy, my dear uncle,' replied I with confidence, remembering the persuasive powers of my pistol. 'The Hindu shall keep his word, you may take mine for that.'

'You must not treat him ill, Marmy,' said my uncle in low faint tones; 'and remember, you must not be impatient for a dead man's shoes. As for me, my sand has well nigh run out. Glendell knows it, my dear lad; and *I* know it.'

'You are tired, dear uncle,' said I; 'you have exerted yourself much this evening, and it is long past your usual bedtime.'

'No: no bed for me to-night. I could not lie down if I would.' He seized my hand, and griped it with a force I could not have supposed him to possess. His brow was damp; his face wore a look of mortal agony.

'For Heaven's sake, uncle, let me send for Mr Glendell. I am certain you are very ill.'

'Nay, Marmy; I am past doctors' skill, and I wish to be with you alone—quite alone.'

As I looked up swiftly at those tender words, I saw something more than my uncle's pallid face—I saw over his shoulder, at the half-opened parlour-door, a pair of gleaming eyes. They were gone in a moment, but I felt assured they had been there; that for some time, long or short, we had not been quite alone, but had had Tannajee for our watcher, and perhaps our audience.

'Bring me that nice arm-chair, Marmy,' whispered my uncle feebly—'the one you gave me.—Bought with his first book, dear lad, dear lad; Heaven bless him!'

Digitized by Google

Before I could gently unloose his fingers from their hold on mine, he thought I had already left the room; his brain was plainly wandering; the noble ship was breaking up before my eyes. Presently, with some disconnected words of prayer, he sank into a doze, and then I went out on tiptoe, and softly fetched the chair. As I passed by Tannajee's room, I noticed his door was ajar, so I closed it, and in order to stop further eavesdropping, turned the key, which happened to be on the outside. Brief as was the period of my absence, it seemed to me that my uncle's looks had already changed for the worse; but at the slight noise I was obliged to make, he opened his eyes, and smiled.

'I thought the bugle had sounded, Marmy, and that I had obeyed it,' whispered he. 'It is time for the retreat. The battle of life is quite over with me.' And indeed it seemed to be. Yet, with my help, he managed to raise himself and shift his limbs to the arm-chair. A smile of mingled love and gratitude then played upon his features for an instant, and as his head fell slowly back, I heard him softly murmur 'Marmy.'

That was Uncle Theo's last word.

CHAPTER XIV.—THE HINDU FLIES.

I had never stood in the presence of death before, but my awe was nothing in comparison to my grief, which broke forth with such vehemence that it aroused both the maid-servants, whose terrified shrieks, when they saw what had happened, were shocking to hear. But their sorrow was at least genuine, and I was glad to think that I had made the Hindu secure, whose hypocritic face would have been far more unwelcome to me than their cries. After a while—I know not who fetched him—Mr Glendell arrived, and ordered all things duly. He was sincerely grieved, though he did not shew his sorrow in our fashion; use had blunted but not destroyed his sympathies. 'I always predicted that your poor uncle would go off in this way,' said he, not without a touch of professional triumph; then added reverently: 'He was a great-hearted man, my lad, and leaves no like behind him, so far as I know.'

When they had laid him on his bed, they left me alone with him, kneeling beside it, and sobbing as though my heart would break, I know not for how long. I remembered nothing; I was aware of nothing, except that my father, brother, friend, was lying there Dead, until a gentle hand was laid upon my shoulder, and a voice as dear as that which was hushed for ever, whispered to me that I was not left utterly alone and unfriended even yet.

It was Rosa, whom her father had sent at dawn to stanch the grief for which he had no other remedy, and mingling her tears with mine, wise homœopathist, she thereby healed me. In that dread presence, I told her how those dumb lips had spoken of her last, and what those fast-closed eyes had longed in vain to see. Not with any intent, Heaven knows, to bind her heart to mine, which was already one with it! I was thinking of him only.

While we yet spoke of this, and when it was still very early, Mr Glendell came and signed to us to follow him into the parlour. 'Marmy,' said he earnestly, 'there has been enough of grief. It is time to think of the wishes of the dead.'

'I think of nothing else,' said I, with my hand still fast in Rosa's.

'But you must bestir yourself also. Did not your uncle tell you to keep the Hindu in your service? Where is Tannajee?'

'I locked him in his room last night.'

'You locked his door, but he was not within. He was seen by the servants in the passage at the time your uncle died. He only waited for his death, I fear, to leave your roof.'

I started up and ran into the study. The window was wide open, and it was but a few feet from the ground. I flew to my uncle's desk, and there lay the canvas bag in which he used to keep his money—empty. The gold was gone. I touched the little spring, and out flew the drawer; but that was empty also. Mr Glendell and Rosa had followed me into the room, and at once perceived that some new calamity had occurred.

'The scoundrel has robbed you, I daresay?' observed the former drily.

'He has taken fifty pounds,' said I; 'but that is nothing. He has stolen the packet likewise that contains the "secret."'

'The devil he has!' exclaimed the doctor excitedly. 'At all events, it is well he took the money, for now we have the law upon our side. You must at once get a warrant for his apprehension, my lad.—Don't be cast down; we'll have him yet, depend upon it, Marmy: he can't elude folks' observation any more than an escaped orang-outang. Now we see how excellent are the ways of nature, and why it is he was made so ugly!'

Mr Glendell spoke thus cheerfully perhaps, because he read in my looks discouragement or despair; but if so, he was never more mistaken in his life. He should have seen in them only a fixed resolve. The words of the ex-maharajah seemed once more to fall upon my ears with solemn distinctness: 'Your future prosperity depends upon the Hindu; he must never leave your service. If he does so, pursue him to the ends of the earth.'

I was but resolving within myself that henceforth I would have no other mission in life, no other hopes nor fears, would know no rest, nor respite, nor enjoyment, until I had obeyed my uncle's mandate, and laid my hand upon the Hindu 'Dead or Alive.'

THE MOON.

As our steamboat was entering Southampton Docks the other day, we noticed the way the vessel was guided in. The bend was too sharp for the rudder to bring the vessel round it, so a hawser from the bows was slipped over a pile-head on the pier. The vessel steamed on, and the hawser continually pulling us out of our course, compelled the vessel to describe a part of a circle, and so safely to enter the docks. We might thus illustrate the motion of the moon round the earth. The attraction of the earth on the moon continually draws it out of the direction in which, at each instant, it is moving, and so compels it, roughly speaking, to describe a circle about the earth as centre. But there is this difference: the force by which the earth draws the moon is not a simple force, as the tension of a rope, but the result of all the attractions which all the parts of the earth exert on all the parts of the moon. Now, these attractions are different for

Digitized by Google

different parts of the earth. They diminish rapidly as the distance increases, being inversely proportional to the square of the distance. Thus, at twice the distance, the attraction is diminished to one-quarter of its first amount; at three times the distance, to one-ninth. The moon, then, attracts the parts of the earth nearer to it more than it attracts the central parts, and these, again, more than the parts of the earth furthest from it. In consequence, the moon draws the earth away from the sea on the side of the earth which is furthest from the moon. It also draws the sea away from the earth on the side nearest it.

Imagine ourselves at the moon, looking down at the revolving earth. We should see on the west side new continents and seas continually appearing, hastening across the face of the earth, and disappearing round the east side. As the waters pass from the western edge to the middle of the face of the earth, they draw nearer to the moon than the centre of the earth, and in consequence are drawn towards the moon more quickly than the earth itself. They cannot leave the earth, and can only obey this impulse by moving round towards the moon more quickly than the earth on which they rest. When they have passed the middle of the earth's face, they are now moving away from the moon, and the action is reversed, and all the velocity given to them before, relatively to the earth, on which they rest, is taken away. We see thus that we may naturally expect the water directly below the moon to be moving from west to east more rapidly than the earth on which it rests; and as we go east and west from that point, this motion of the water will become less. The same will be true of the water furthest away from the moon. We may thus consider the ocean as a stream of water flowing round the earth, generally at the same rate as the earth below it, but sometimes slower and sometimes faster. Where it moves faster, it will be shallower. Thus, we may expect the sea to be shallow at the point below the moon, and that furthest away from the moon; and as successive places are brought, by the rotation of the earth, below or away from the moon, they have low tide, and intermediate to these, of course high tide. Such is a rough explanation of the tides. There are other circumstances to be taken into consideration, as, for instance, the fact that the seas cannot flow freely, but are impeded by friction. The general effect of it all is, that looking thus down on the earth from the moon, we do not see the low tide immediately below us, but to the west, in the western half of the earth's face; and the high tides are not on the western and eastern edges of the face, but are round behind the western edge and the other, between the point immediately below us and the eastern edge of the earth.

Now, the moon hastens the waters in the western half of the earth's face, as we thus view it, and retards those in the eastern half, tending to make the former move faster, and the latter slower, than the land on which they rest. But the tidal heap is in the eastern half, and therefore, on the average, more water will be in the eastern half than in the western. Thus, more water is retarded than hastened. If as much water were hastened as retarded, these motions would neutralise each other; but more being retarded than hastened, there results a slight average retarding of the waters of the ocean, causing them to move round more slowly than the earth, and so, relatively to it, to flow slowly westward. Of course, owing to lands hindering the free flow of the sea, innumerable local currents are produced, which in their backward and forward flow nearly neutralise each other; but as the final result of all these motions we find a slow westerly current in the ocean, due to the moon's action.

This current does not move without friction against the lands it meets, or the deeper waters of the ocean over which it flows. By this friction, as the earth is revolving in the opposite direction, it tends to check the rotation of the earth. Just as the brake upon a windlass checks the rotation of the windlass and the lowering of the weight, so this friction against the earth acts as a brake, gradually stopping it. If we set a celestial globe spinning, we can soon stop it by gently laying a finger upon it. So the moon, as it were, lays a fairy finger on our earth's equator, and, light as the touch is, the earth's rotation will in time be stopped. Ultimately, the earth will constantly present the same face to the moon, just as the moon does now to it.

There is a curious action in compensation upon the moon, which admits of an easy explanation. Owing to the tidal heaps of water, the general attraction of the earth on the moon is not directed to the centre of the earth, but to a point a very little distance from it on the tidal axis, which points, as we have shewn above, eastward of the moon. Roughly speaking, the moon moves in a circle round the centre of the earth from west to east; but it is thus continually pulled, not to the centre of the earth, but to a point a little towards the direction in which the moon moves. Now, when we have a stone at the end of a string, and wish to make it whirl round faster, we move our hand in a little circle, pulling the string continually, not to the centre of the circle in which the stone whirls, but to a point a little more in the direction in which the stone is moving. Thus, the loss of rotation in the earth is compensated for by a more rapid motion of the moon, which, in consequence, will fly further from the earth, and describe a larger orbit. This change, however, is practically too small to be observed.

We have shewn above how the moon produces a tide on the earth. Supposing the moon to possess an ocean, what kind of tides will our earth produce in it? The mass of the earth is eighty-eight times that of the moon. If, instead of one moon, we had eighty-eight such clustered together, each evidently producing a tide, there would result on the whole a tide eighty-eight times as high as at present. We can thus see how the tides in the moon, being produced by the earth, would be far greater than those we have. By calculations which we could hardly explain in an elementary manner, we come to the result, that the tides in the moon would be about forty times as high as those on the earth, or about one hundred and ninety feet high on the average. A rather surprising result. Such a tide would sweep a large part of England clean, twice a day. Alpine climbing, far from being a luxury, would be a necessity. But there is this difference: owing to the small mass of the moon, bodies weigh there less than a sixth of what they do here. So the labour of avoiding the tide would be but slight. Supposing the moon to be inhabited by creatures like men, we can compute their statures that they may have the same agility. Of men similarly formed, the weights will vary as their

Digitized by Google

bulks—that is, as the product of their length, breadth, and thickness. As the men are supposed similarly formed, the breadth and thickness will both vary as the length, and thus men's weights will vary as the cubes of their lengths. Now, their muscular power varies as the cross sections of their muscles, which it is easy to see will vary as the squares of their lengths. A man twelve feet high will thus weigh eight times as much as one six feet high, but will have only four times the muscular power; and if the six-footer be sluggish, the twelve-footer will probably be unable to stir his vast weight. If, however, the twelve-footer were of materials only half as heavy as the six-footer, the relation between weight and power would be the same in both cases, and they would be equally agile. The material of man weighing less than one-sixth its weight here, on the moon, he could thus afford to be more than six times as tall, and be still as agile. Men forty feet high would move as freely on the moon as we do here, and experience no more inconvenience at a tide of one hundred and ninety feet, than we do at one of thirty feet—a height commonly equalled, in fact, often exceeded at places on our globe. We may notice in passing, that on Jupiter, man's stature would have to be dwarfed to thirty inches, to preserve his agility.

The action of tides in stopping rotation, shewn above, must take place whenever bodies capable of tidal action revolve round each other. The sun as well as the moon exerts an influence in stopping our rotation. Jupiter's moons, if he possess an ocean, will in time destroy even his rapid rotation. But this is too remote to be of much interest. It is more worthy of remark that we meet with many bodies whose rotation evidently has thus been stopped. Our moon is such, ever presenting the same face to the earth. The satellites of Jupiter and Saturn, as far as can be observed, are in the same condition. And we can see the reason of it. Imagine our earth and moon, each possessing oceans, starting with equally rapid rotations. Each will produce a tide in the other, and so tend to destroy the other's rotation (we perhaps should say independent rotation, but the reader will understand what is meant). But there will be a great difference in the two cases. The amount of rotation to be destroyed will be different in the two bodies. Take a grindstone, for instance—a great effort is required to set it rotating, and an equally great one to stop it. The larger the grindstone, the greater the effort required. Now, we might regard the earth and moon as two such grindstones; and computing, as can easily be done, the ratio of their amounts of rotation when revolving at the same rate, we find it to be about twelve hundred to one. If the earth and moon, then, exerted the same power in stopping each other, the earth, having only $\frac{1}{1200}$th part of the work to do that the moon would have, would do it in $\frac{1}{1200}$th part of the time. Thus, if the earth stopped the moon in 1,000,000 years, the moon would require 1,200,000,000 years to stop the earth. This is supposing the powers they exert, in stopping each other, equal. It is not, however, easy to see the relation between the power with which the earth and moon act on each other by the friction of the tidal current. It depends not only upon the actual amount of the tide, but also on the amount it lags eastward of the tide-producing body. The higher tide of the moon would probably lag behind the earth much less than the earth's tide lags behind the moon. If the lagging were equal, the earth's power would many times surpass that of the moon. If the lagging in the moon were less, the earth's power would not be so many times greater. Certainly the earth's power would not be less. Of course, the greater the power the earth exerts, the sooner the moon is stopped. Certainly, then, the moon would be stopped twelve hundred times sooner than the earth. Looking back, then, on the long ages during which our earth has existed, we can easily conjecture how long it must be since our moon had that rapid rotation upon its axis, which apparently is necessary for the existence of life.

It may perhaps appear that we have assumed a great deal. No oceans now exist on the moon; so our tides may seem pure imagination. Well, we will refer to the point again. Let us glance for a while at the moon's present condition. Practically, the moon has no atmosphere. This is shewn in many ways. When the sun sets on a clear day, it appears not round but oval; the air bends down the rays of light passing through it, and bends those most that are nearest the horizon. A ray being thus bent down, its direction, when it reaches us, appears to be from a point above that from which it really came, and the object will be seen above its real position. Thus, the sun appears higher in the sky than it really is, and the lower limb more so than the upper, so as to approach to it, and cause the apparent flattening. The sun, indeed, has really set to us when, by this bending of the rays, he is still visible. Rays of light grazing the earth, and passing out into space beyond, will be doubly bent to the earth; thus, the atmosphere would enable an eye behind the earth to see a little round the corner, and the sun would still be visible for a little time after it had really passed behind the earth. Now, the moon often, in its path through the sky, passes over a star; if she had an atmosphere, the star would be visible some little time after the moon had passed between it and the spectator, and also reappear a little before the moon had passed from over it; thus, the time that the star is hidden would be shortened by the moon's atmosphere. Observations of this kind prove that the moon has no appreciable atmosphere. Or, again, as the sun seems flattened when setting, if we watched with a telescope the moon pass over a planet, the latter would appear flattened if there be an atmosphere. No such alteration of form can be detected. Again, an atmosphere produces a twilight, and if the moon has the one, it will also have the other. Very careful observation has shewn that such a twilight exists in the moon, but so slight, that the height of the atmosphere, to which it is due, cannot be more than a mile, and it must be rarer than any vacuum that can be formed in an air-pump. Other reasons might be adduced; these, however, may suffice. With such an atmosphere, water, to any considerable amount, cannot exist on the surface of the moon; for, as there the day is as long as fourteen of ours, the sun's continued heat would create an atmosphere of steam greater than we know exists. At the same time, careful examination with the most powerful telescopes has shewn that no lakes or seas of any but the smallest size can possibly exist.

When we examine the moon—we do not mean with large and powerful telescopes, but such as any person can put together for himself at the cost

Digitized by Google

of a few shillings—many particular features can be at once recognised. The southern part of the moon is especially noticeable as pitted all over with round cavities, often so close as to run into each other. They are of all sizes, from the minutest specks to great pits, almost discernible by the naked eye. Their character is singularly uniform. A great circular wall, the height of which can be easily estimated by means of the shadow it throws, surrounding a circular plain, usually depressed below the level of the plain without. In this plain, often one or more conical mountains rise. We are at no loss for objects on our globe to compare them with. Among the Andaman group is a volcanic island; a lofty and precipitous wall, eighteen miles in circuit, encloses a circular plain but slightly raised above the sea-level; in the centre a steep hill, the cone of an active volcano, rises to a height of about eighteen hundred feet. We could pick out mountains in the moon answering almost exactly to the same description. It is impossible to resist the conviction that the cause is the same. The lunar craters, indeed, usually vastly exceed in size those found on our globe; but we shall notice hereafter the reason for it.

These various mountains, and other natural features, have received names, and we may, in passing, notice a few of the more conspicuous. Plato is one of these vast craters, considerably to the north in the moon (readers will remember that astronomical telescopes invert objects, making north appear south, and *vice versâ*), and so presenting not a vertical but a bird's-eye view, appears as a vast oval, with the central plain extremely dark and depressed. Copernicus, which becomes visible, or, in other words, at which the sun rises soon after the half-moon, is very conspicuous, terraces in its circular wall being easily detected, while a group of conical hills, two of them very easily seen, stands in the centre of the enclosed plain. Tycho, a crater considerably to the south, is of such dimensions that, if a circle were cut out of Switzerland, including Mont Blanc, the Matterhorn, and Monte Rosa, down to a level with the sea, the whole might be placed within Tycho, and not a single peak be seen over the edge. Then, too, of conical volcanic peaks, such as that of Teneriffe or Adam's Peak in Ceylon, there are beautiful examples in the moon. Pico, which shines like a little triangular speck of burnished silver, with a little patch of shadow attached, a little to the south of Plato, is computed to be at least seven thousand feet high, and rising as it does abruptly from a comparatively flat plain, would be a magnificent spectacle if on our globe, the more beautiful, as several similar though smaller cones are clustered near.

But with all this show of volcanic force, the moon, though carefully watched, has given but few signs of fiery life. Herschel and others have observed phenomena at various times which resembled an eruption of lava in one of the lunar volcanoes, and lately it appears that the crater Linné has been slowly filled up, apparently by an eruption of mud or ashes. But the lunar volcanoes, if not actually extinct, are probably not far from being so.

Besides volcanoes, there are other interesting natural features in the moon: great depressed plains, presenting the appearance of ocean-beds; mountain ranges, produced evidently not by volcanic forces, but by the erosive action of water. For instance, the Apennines, a range some four hundred miles long, rise to the south of the Sea of Showers to a height of twenty thousand feet, sloping gently to the south, but to the north presenting a steep and almost precipitous descent to the great depressed plain. It thus presents a close parallel to the Andes, which rise gradually on the eastern side, but to the west overhang the Pacific with a far steeper incline. The Ghauts of India, too, have the same peculiarity; and many other instances might be named. The height of the lunar Apennines may appear extraordinary, considering the comparative smallness of the moon; but if the Pacific were drained, and we measured the height of the Andes from the bottom of the depression, we should probably double their height. When, as we believe was once the case, the Sea of Showers was filled with water, the height of the Apennines above the level of the sea would not be so surprising.

To produce a volcano, water is required. By the slow escape of the central heat of our globe, the interior parts cool and contract. The crust of the earth, left without sufficient support, cracks and subsides. The shock is propagated through the earth, and an earthquake is produced. Often water penetrates, and in the form of steam at high pressure drives up the molten rocks before it, and a volcano is produced. No water can be detected on the surface of the moon; where, then, is the water that produced the volcanoes we see there? Some have suggested that the solid part of the moon is pear-shaped, with the stalk end as it were towards us; whilst the water has all accumulated on the flattened end of the pear, and so is invisible to us. Such a supposition, however, appears extremely gratuitous, and besides is unnecessary. If any of Jupiter's or Saturn's satellites were so constituted, the part furthest from Saturn or Jupiter would be less bright than the rest of their surfaces; but though their surfaces do vary in brightness in different parts, the dimmer part, in no case, we believe, is that which is furthest from their primaries. So there is no analogy in favour of this idea. The solution of the difficulty arises from the different bulks of the earth and moon. The weights of bodies on the moon is less than one-sixth of what it would be on the earth. Now, we know that the sun is composed largely of elements such as exist on our globe; nay, further, remote fixed stars are so also. We have thus every reason to believe that the materials of the moon will not differ much from those of the earth. As the interior of the earth cools down and contracts, the weight of the outer crust, which, if strong enough, would be left as a shell, breaks it down, and crushes it into the contracted matter below, so that no cavities, or comparatively small ones, are left. But in the moon, the shell covering a cavity would be of smaller radius, the moon's radius being less than that of the earth, and consequently stronger. Above all, the weight of the materials composing it being less than a sixth of the weight of the materials of the earth's crust, but as strong, owing to the feebler force to crush the crust down, cavities would be formed on a far larger scale than could exist in the earth.

Imagine, then, the earth and moon at equal temperatures. They cool down—the moon, however, being the smaller, the more rapidly. The thin crusts at first formed on each are crushed down on the central mass as it contracts. After

Digitized by Google

a while, when the crusts have acquired some thickness, the lunar crust becomes thick enough to withstand the crushing for a while, and cavities are formed. When the break-up takes place at last, the lunar oceans penetrate, and pouring in immense quantity into the large cavities, meet the still hot mass below, and a tremendous volcanic outburst is the result. When we remember that the power of the pent-up steam would be as great as on the earth, but the rocks and lava to be thrown up would weigh less than one-sixth, we can easily understand the vast craters which exist on the moon, so thickly in places as to suggest the idea of the surface having been blown up in bubbles. As the cooling process continues, other and larger cavities are formed, the weight of the superincumbent crust being too little to crush it down into them. Into these ultimately the oceans descend, and after them the atmosphere. We thus see how, by the cooling down of the moon, vast internal cavities have been formed, in which her ocean and atmosphere are now buried. The atmosphere that still clings to the moon is but the thin upper layer, the rest has long since disappeared. The rates of cooling down of the earth and moon are inversely proportional to their diameters, or as three to eleven. The disproportion between these is nothing so great as that between the times of their stopping each other's rotations. We can thus see why it is that, whilst ages ago, the moon has ceased to rotate independently of us, she still continues to shew some signs of central heat in the few cases of volcanic outburst that have been observed.

Dreary, indeed, must be the scene that the moon now presents. Here, our air spreads by day its blue curtains, to temper the black vault of night. No such veiling there. When the sun rides high, the stars will all shine with little lessened lustre on the black sky; the mountains will cast not a shadow but night itself. Could we but see it close, it would be as some nightmare vision we should gladly forget. Possibly the absence of all half-tones in shadow would confound our eyes, and we should see without perceiving; not, indeed, that all the rocks would be rugged and angular, the outlines not softened by time. When the volcanoes we see were thrown up, far other was the state of the moon; then the ocean wore the shore, and the rain and frost smoothed the mountain slope. Even now, amid the confusion and savageness of lava-beds and cinder-hills, we should see what would call to mind memories of happier times—here some smoothed chasm, where of old, under a bright sky, the brook murmured; there some shingly beach, where once the sea rippled round the polished pebbles. But all this is gone; and cracked, worn, wild, and barren, the moon presents an image of death. We admire its brightness, and are as the children of whom the poet speaks—

> She saw her brother Peterkin
> Roll something large and round,
> Which he beside the rivulet
> In playing there had found:
> She came to ask what he had found,
> That was so large, and smooth, and round.

We thus trace the history of the moon, once, like our globe, rotating with a day and night suited for organised existence. Its seas may have teemed with fishes, its air with birds, its plains with animals; some even may be endowed with reason—as fair as, may be fairer than our globe. We have seen how, by the tidal currents produced in its oceans, our earth, slowly but surely, has stopped its rotation, and so unfitted it to sustain life; at the same time, by cooling down, cavities have been formed, within which its oceans and atmosphere are now buried. It is a *memento mori* for our earth. As it is, so must this globe of ours become. Somewhat different, indeed, may be the manner of it, but the final ruin is the same.

Yet, dreary as, at first sight, the idea of this inevitable decay appears, it really suggests an encouraging thought. That which points to an end, points also to a beginning. We are not left the victims of blind and inevitable laws; there is behind them a power, dimly revealed thus even in Nature. Yet, weary of iron necessity, we turn gladly from Nature to Revelation, from Law to Love.

ZEKEL FLINT.

IN SIX CHAPTERS.—CHAPTER IV.

'Dig? Let 'em dig, and dig, and dig till they're tired, and faint, and hungry, and ragged, and their tools air worn out,' said Zekel; 'and then they 'll be glad to come down to old Skinflint's store, and buy his goods, for nuggets, and cents, and dollars, and dust. What do yew want to go up for? Stop where yew air, my lad, even if yer wound is well, and six months old, as I told yew it would be. Yer bread 's buttered this side, my lad, not t'other side; so stay where yew air. I 'm not going to make a lot of flam about it; but just shew me that yew 're a business fellow, and yew shall have Ruthy, and go halves in the store. There now! What more can yew want?'

'Nothing,' I said. 'But how am I to shew you that I am a business man?'

'Don't know: wait a bit,' said Zekel; and I busied myself in the store, where we used to do a famous trade, especially since I could go down to the port and buy first-hand of the captains, while Zekel minded the store. Previously, he had never cared to leave, on account of his child, and often, in consequence, bought at a loss.

But how was I to prove myself a business man? I asked Ruth; but she could not tell me, though matters went on so pleasantly that I felt no envy on seeing some of my old companions come into the store one evening, and seem half disposed to laugh at me for turning assistant to a storekeeper. They had had tolerable luck; but I knew that their luck was not so good as mine, for what man is there that will say gold is comparable to a loving, true-hearted girl; though, for that matter, there can be no objection to gold as well.

The store prospered; but at last a cloud came—a cloud of suspicion—for Zekel kept missing money in a most mysterious way. His custom was to place all the cash he took in a leather bag, which he always carried about his person; gold dust and nuggets, on the contrary, were, after weighing, packeted and marked before placing them in the strong box, over whose safety Zekel watched most carefully. For undoubtedly he was a prosperous man; and I knew of more than one valuable consignment of gold sent to New York for safety; while during the prosperous state of the diggings, Zekel's trade increased rapidly.

Digitized by Google

Ruth mentioned the fact to me first, that her father felt sure that he was being robbed, for money kept disappearing in a most unaccountable manner.

'Does he lose it from his box?' I said.

'No,' replied Ruth; 'from the leather bag.'

'But he never parts with it for a moment. You told me yourself that it was buckled round him when he slept.'

'Yes; he never parts from it night or day,' said Ruth; 'but for all that, the money goes.'

'Well,' I said, 'it must be either fancy, or else there is a hole in the bottom of the bag.'

The conversation dropped, and in the bustle of business I soon forgot all about it, until the marked coldness with which the old man treated me brought it all before my mind once more. 'Why, surely the old fellow cannot think that I have robbed him,' I said to myself; and he grew so curt and suspicious at last, that I determined to speak to him upon the subject, being full of anxious thought for the future, especially since of late the old fellow had trusted me almost like a son. I could not afford to offend him; so, for Ruth's sake, I determined to bear with all he said patiently and calmly.

'*But* surely, Mr Flint,' I exclaimed somewhat warmly, after an hour's conversation, 'you cannot think that I would be so base, after all your kindness. Do you think my love for your child only a pretence?'

'What am I to think, my lad; tell me that? Yew say, how can I suspect yew? Who am I to suspect?—my own child? The money goes; and it lies between one of us three here in the store. I know that it is not me; while as to Ruthy, I'd sooner charge myself.'

'So would I, a dozen times over,' I said bluntly.

The old man chuckled for a few moments, but that cold angry look came over his face again as he said: 'I always said as no man living could do me; but by the tarnation creation, some one has done it this time, and slick too.'

'Regular business-like way,' I said bitterly.

''Nation!' said Zekel.

'But,' said I impatiently, 'how much have you lost? When did you lose it? And when was the last taken?'

'Dunno, dunno, dunno,' said the old man; 'but the money goes more or less every day.'

'Gold or silver?'

'Both, for anything I know; but mostly gold.'

'Then you must give it away by mistake in change,' I said; 'and it's too bad to suspect one whom you ought to trust in every way.'

'Change—give away!' exclaimed the old man angrily. 'Do yew think I'm a fool, young man? Now, just look here. We'd best part. It will be better for both of us; and been better still, p'raps, if we'd never come together.'

I begged, I prayed, I humbled myself in every way; but the old man was inexorable. He evidently suspected that I was the thief; and the only consolation I had was the loving trust of poor Ruth, who was nearly heart-broken when I left.

A few days after, I was busy with the rest up a creek, handling spade and pannikin, pick and cradle, working up to my knees in water to pick the bright specks of gold from gravel or washing stuff. Then a month passed, during which time I had no communication with those at the store, when one day, just in the height of business, I felt a hand laid heavily upon my shoulder, and looking sharply up, there stood Old Zekel, looking very grim and sallow; but he held out his great broad palm, and upon my taking it, made my eyes as wet as my feet with the gripe he gave me.

'I beg yer pardon, Harry,' he then said gruffly; 'it warn't yew as took the money!'

'What!' I said eagerly, 'have you found out the thief?'

'Cuss him for a skunk! No, I ain't,' he roared angrily; 'I only wish I hed.'

'Then how do you know that it ain't me?' I says.

'Why, how the tarnation could yew be up here at the diggins, and take the money down there, too, eh?'

'It still goes then?' I said.

'Goes,' he growled; 'yes, it goes; and I've tried every dodge I know to find out how. I've never let the bag go out of my gripe; I've counted my money of a morning; I've put down every penny I took upon a slate; and then counted up at night, and it's been short.'

'Made any mistakes?' I said.

'Nary one—not counted a cent out. There's something wrong somehow.'

'Any holes in the bottom of the bag?' I said.

'Look yourself;' and then, from beneath his blouse he drew the leather tourist cash-bag strapped over his shoulder, and suspiciously holding on still by the steel clasp, he let me examine the bottom, which was intact.

'Have you looked in the lining?' I said.

'No,' he replied bluntly.

'Then, why don't you? Perhaps a whole lot of pieces have slipped in between it and the leather.'

''Taint got no linin',' he said. 'The bag's right enough. This is the third new un I've hed since yew went away, my lad, and neither Ruthy nor me can't make nothing of it.'

'How is Ruth?' I said, conjuring up as I spoke her bright face behind the store counter, with half-a-dozen fellows eagerly seeking a smile; and then feeling half mad with the jealous feeling that came over me.

'She's all right,' said the old man; 'but she can't help me a bit.'

'Send me any message?' I said, turning a bit red, and feeling sheepish.

'Told me to give yew her love.—And now, my lad, you'll come back again, and help me, won't yew?'

'Come back!' I said angrily. 'No, I won't. You turned me out like a dog, and called me a thief.'

'Nary once, nary once, my lad!' he exclaimed.

'Well, you looked upon me as a thief, at all events,' I said, as I recalled the earnest way in which I had protested my innocence; and for the moment I felt that I meant it, when I declared that I wouldn't come back to please him after such treatment.

'I thought yew wouldn't,' he said drily, 'knowing how pesky yew young cocks air when yew're putt out; but Ruthy said she'd be much obliged if yew'd come back and help her old father.'

I began to melt a little.

'Trade wants yew to brush it up a bit, my lad; and Ruthy's looked 'nation dull since yew've been gone.'

I thawed a little more, and I'm nearly sure the

Digitized by Google

old rascal winked to himself as he said: 'Yew're wanted there, too, 'mazingly, for there's a couple o' long down-south chaps as bother Ruthy a deal too much; and she don't like it, yew know.'

Of course that last hit did it; but I was too politic to give way yet.

'So you want me to come down and help you,' I said, 'to try and find out how this money goes?'

'That's it—that's it; for I'm down-beat with it, my lad.'

'He'd be a sharpish chap to find it out,' I said.

'Reg'lar razor-blade, my boy, fresh strapped.'

'Business-like enough chap to make Miss Ruth a husband, eh?' I said.

'Yew're a nice un, yew air, now, ain't yew?' said the old man, grinning all over his face, as he gave me a back-handed thump in the chest that took away my breath. 'There: I tell yew what, my lad,' he continued, 'if yew'll putt salt on the tail of the bird as does this job, I'll give yew a hundred dollars. Now then!'

'I don't want your dollars,' I said; 'I want something else. Now, is it a bargain? If I find this out, will you give your consent to you know what?'

Old Zekel hitched and screwed about; grinned, groaned, shuffled in body and speech; but that a favourable arrangement had been arrived at, may be judged from the fact that I was back that night at the store, with Ruth looking more bright and charming than ever, as she welcomed me as warmly as I could wish.

CHAPTER V.

Before I had been back a week, I found that I had my task to do before I could meet with my reward; for, in spite of all our vigilance, the money still went—mysteriously, unaccountably; and I was fain to declare myself as yet quite at fault; when, at supper one night, the old man again asked me what I thought of it.

'It's a nailer, ain't it?' he said, almost looking pleased at my discomfiture; but then there was Ruth to cheer me on, and I watched, and thought, and turned it over and over for another week without result, when, at supper, the old man declared his intention of pulling up stakes, and going elsewhere.

'I shall be ruined else,' he said gloomily. 'I'm sure I'm losing hundreds of dollars, and I can't stand it any longer. Why, the very idea of me—Old Raw—being done like this is eating my heart away, my lad, let alone the loss of the money. I'll make tracks.'

'Wait a little longer,' I said; and that night, while I lay awake, seeming to see Ruth fading away from me, and my chances grow less, I resolved upon a plan, and getting out of bed in the compartment next to the old man's—for, since my return, I had slept at the store—I began to call him gently, not daring to go near him, in case of a salutation from his revolver.

'Mr Flint! I say, sir,' I cried, till I woke him; and as soon as he knew that it was something about the money, he roused up, and over a couple of his best cigars we talked over my plan.

'Let yew carry the bag, and be money-taker,' he said. 'Well, is that all?'

'Yes,' I said, 'that's all; but I feel certain of detecting the theft if you let me carry the bag.'

'Young man,' he said solemnly, 'don't yew make sure of anything; there's something of what the Scotchmen call "no canny" about this job; but, howsoever, yew shall be bag-bearer if yew like.'

I felt half-sorry afterwards that I had disturbed him for such a little thing; but feeling more satisfied in my mind, I dropped off to sleep; and the next morning—first thing—Zekel slung the strap over my shoulder, saying: 'There's twenty dollars in silver in it; so, now, see how yew get on.'

One day—two days—three days—I took the money; a good deal too—enough to make the bag heavy; the old man quietly noting every transaction down upon a slate, as I took silver, gold, and copper, placing, according to his custom, gold and silver in one division of the bag, the baser metal in the other; but every night, when we came to reckon up, there was evidently a large deficiency, so that at last I was almost in despair, and offered to give up the charge of the bag, for I had been as particular as was possible in the hurry of the evening business, especially both in taking money and giving change.

But 'No,' said the old man; 'yew may just as well go on as me; for I trust yew, my lad, I trust yew.'

The old man seemed so down-hearted at last, that one evening I quite felt for him, as he sat with his head resting upon his hand, while Ruth was weeping silently as she tried to whisper comfort. The day's business was over, and quietly shut in together, we had been going over the money, counting it into little piles, and entering the amount in a book the old man always kept; while I felt as despondent almost as the old man, for all my sanguine hopes had been dashed, and what to do I could not tell. I sat quite still for some time, gazing mournfully at the couple before me, and then began, almost unconsciously, to pile up and spread about upon the table some half-dozen half-dollars, when a light flashed across my brain, and just as poor old Zekel exclaimed sadly: 'Yes, my little lass, we'll make tracks, or I shall be ruined,' I started up, gave a regular Indian whoop, as I shouted: 'Not this time, dad; I've treed him!' when, hugging Ruth furiously for a minute, I proceeded to perform a triumphal war-dance round the place, to the intense astonishment of the old man.

'He's mad!' exclaimed Zekel angrily.

'Yes,' I said, 'for joy. I've treed him!'

'Who? who?' cried Zekel.

'The thief!' I cried. 'I know him well. But stop a bit: be ready to-morrow, and we'll have him safe.'

'But, what? how?' began the old man.

'Never mind,' I said sturdily, as I strode about the place.

'How did yew find out?' he said again.

'Wait till to-morrow!' I shouted.

'But tell me how.'

'Wait till to-morrow!'

'He is mad,' cried Zekel angrily.

'Wait till to-morrow!' I cried again.

'But'——

'Wait till to-morrow!' I cried once more, almost beside myself with joy; and then, for fear of being talked out of my secret, which might get wind, I ran into my own sleeping-place, which that night turned out to be misnamed.

The next morning, I laid my revolver upon a

Digitized by Google

little shelf just beneath the counter, and seeing my motions, old Zekel did the same, and then an anxious day passed, during which I could plainly see that the old man was in anything but a good humour, and had but very little faith in my declaration. Ruth looked heavy-eyed and reproachful, and she did not speak, though I do not think that the look of encouragement I gave her was without its effect.

The day went on, and all through the morning I eagerly scanned each piece of money I took till my heart began to sink for want of confirmation of my suspicions; but at last a customer or two came in, and when they were served and went away, my heart gave a great jump, for I was now sure, and could hardly contain my exultation.

Night came without anything eventful taking place; old Zekel was savage as a grizzly; for at every hint he dropped, I only said: 'Wait a little.' Ruth, too, looked hopeless and disappointed, while, when night came, and I had nothing to shew, the old man's fury was fierce, as I tried to pacify him in vain.

The next day I was hopeful still, for the same two customers came; and at night, when my heart was sinking, and I could not look Zekel in the face, up it came right to my throat with a bob, and then set to beating furiously, for the man I had spotted down in my own mind slowly sauntered into the store, called for an 'eye-opener,' swallowed it; asked for a cigar—one of the best—which was handed to him in a box, carefully chosen, rolled upon his tongue, and then placed ready for smoking; while the customer rattled a five-dollar gold piece down upon the counter.

'Change here, Harry,' said Zekel, after assuring himself of the genuineness of the coin; and then, with trembling hands, I counted out the amount upon the rough counter.

'Give me a light, young man,' said the customer, leisurely picking up, coin by coin, the money I had laid upon the counter, and rejecting, as I had known him do before, two or three pieces which were worn and thin, for a reason which I could now perfectly understand.

I changed the pieces, and then, as he was picking them up, I gave Zekel a fierce kick in the leg, to call his attention, as exclaiming loudly: 'Did you ask for a light, sir?' I leaned over the counter, clutched him tightly by the collar with one hand, while with the other I presented the barrel of my revolver containing a lighted match.

What followed seemed to occupy only a few seconds, when my pistol was dashed up, sending a bullet through the shingle roof, as the man bounded to the door; but the next instant, there was another sharp ringing report; the man leaped from the ground, and fell just outside, shot through the leg; while, with more activity than I could have given him credit for, Old Zekel followed his shot, and presented his revolver at the groaning man's head.

CHAPTER VI.

Grin, laugh, and pucker up his face—a walnut was nothing to it—when I told Old Zekel of the trick.

'Have her, my boy?—Yes, of course yew shall: when yew like, when yew like.'

'No, I won't,' I said.

'Yew won't?' he said blankly.

'No; not when I like, but when she likes,' I said. And the reply I had told me that I should not have very long to wait, as the sequel proved.

'But tell me again, lad,' cried the old man; 'I could hear it for a hundred times; and there, I should never have found it out, I naw.'

'Well,' I said, telling him once more, 'it struck me all at once that night as I was turning over those half-dollars, and saw that they had a strange, bright, unnatural look for old money. Gold has, you know, a strange affinity for mercury, so much so, that, at the diggings, they mix quicksilver with the broken quartz, when it takes up all the gold, and they come away mixed together. Now, if you take some quicksilver, and put it in a bag with some sovereigns, in a short time it will all have disappeared; and your sovereigns, or five-dollar pieces, will be all plated over with it, and look like so many shillings, or twenty cents. So their dodge has been to rub silver money with quicksilver, knowing you kept gold and silver together, come and spend it with you in the morning; while our friend there with the shot-hole in his leg would come and get change of a night, getting with it, most likely, one, two, or three five-dollar gold pieces given him for twenty cents, which they would look just like in the evening, after lying in that bag side by side with the quicksilvered pieces. And now, I don't think you'll mix them again, will you?—Oh! Your hand isn't light, though, upon one's back.'

'But he got his change this time, eh? my lad, eh?' and once more the walnut face was puckered up. 'He won't want any more, will he? Nary cent. But there, lad, I could listen to it a hundred times: quicksilvered pieces—gold—affinity—turned white; and did me! Old Raw done thoroughly. But there, lad, tell me again. Yew're a lad of mettle!'

'Well, thank you,' I said; 'but suppose we change the subject now to something for which I have a great affinity.' And we proceeded at once to talk about dear Ruth.

THE PEOPLE OF THE PARANÁ.

The English consul for Rosario, who, a few years ago, made the eastern world familiar with the natural beauties and the great resources of the Argentine republics, now gives it a description of the Paraná,* as he prefers to call the River of Silver, rejecting the appellation Rio de la Plata, conferred upon the western stream by Sebastian Cabot, after he had exchanged with the Guarani Indians, near Paraguay, what the historian styles 'some worthless drugs,' for many valuable silver ornaments which they were wearing. The grand old title Paraná, 'resembling the sea,' has much more meaning and beauty, and is not, like the other, suggestive of the successful chicanery which aided unscrupulous cruelty, in the European conquest of the New World. This book has been written with the intention of affording the fullest and clearest information to persons intending to

* *The Paraná, with Incidents of the Paraguayan War and South American Recollections, from* 1861 *to* 1868. By Thomas J. Hutchinson, H.B.M. Consul for Rosario. London: Edward Stanford.

Digitized by Google

emigrate to the Argentine regions, and pressing the advantages of the country, as a field for emigration, upon public attention.

The advantages which the Argentine and Uruguayan republics offer to the emigrant are doubtless great, supposing the first and very important difficulty of the expense of the voyage —we are alluding now to emigration from Great Britain and Ireland—to be surmounted. The climate is mild, the soil is rich, and in its first fertility, and the great rivers are navigable. Capital, industry, energy, and intelligence are scarce among the native population, so that emigrants who introduce and use these elements of success have it very much their own way; and a system of well-organised emigration, composed of men of capital and labourers—there is no career, no place for the professions and the smaller industries—might be a very fine thing indeed. It is not likely the fine thing will come to pass, because men of capital find use for it, with large profit, much nearer than the Argentine republics; and 'hands that are expert with the shovel, the hoe, and most of all, the plough,' which Mr Hutchinson says are the emigrants wanted 'out there,' cannot afford, even if helped as liberally as any government could be induced to help them, to go to South America. Then there are three objections in the way of emigration, which are undeniably forcible: Spanish is the language of the country; the governments are not founded on stable bases; none of these governments will protect immigrants, who would therefore be obliged to protect themselves, a task whose magnitude is much more easily understood from Mr Hutchinson's narrative than the means of its accomplishment. But apart from its chief ostensible purpose, the book is full of interest for stay-at-home travellers. Remembering the dreadful deeds of Cortes and Pizarro, one cannot be altogether displeased to learn how the first Spaniards who landed on the shore of the Paraná were treated. Funes relates that in 1515, when the squadron of Solis came in sight, the Charruas Indians appeared in large numbers on the northern coast, and offered, by gestures, various presents of game and country produce, to induce the strangers on shore. For a time, Solis was distrustful; but as they left these gifts of friendship on the beach, and retired out of sight, the navigator proceeded to land with some of his people, and all unarmed. A party of the Indians, who had concealed themselves in a small grove between Maldonado and Monte Video, fell upon, killed, and ate them, in sight of the fleet that contained their companions. Mr Hutchinson does not think this is proof that cannibalism existed 'as an institution' among the Charruas. Perhaps not; but it is difficult to discern the moral difference between an 'institution' and an exceptional festival. They may not have cared about eating Indian; but plump foreigner, with felonious intentions, was another thing. At all events, it is not likely that the meal of proud invaders was an entirely original and spontaneous idea; and the historians Guzman and Centenura state that anthropophagy prevailed in other parts of South America, and that the cannibals ate human flesh on the principle of many African tribes—that is, the belief that eating their enemies made them more valiant, if not invincible.

Ten years later, Cabot arrived at the mouth of the Paraná, ascended the river above Rosario, and built the fort called del Santo Espiritu, had a ship constructed in the port, made treaties with several tribes, and ascended to the confluence of the Paraguay and Paraná. He had a good deal of fighting, but always conquered in the end, and ultimately penetrated beyond the boundary of the Guarani tribe to where Asuncion, the capital of Paraguay, now stands. This was a great achievement for one man, and thenceforth the Spanish rule, though occasionally troubled, and marked by several individual tragedies, was secure. Many leaders of the succeeding adventurers were murdered; some were utterly disheartened, and gave up the golden dream; but the Spanish cities rose; the forts were garrisoned; the Indian tribes, sometimes victorious, and frequently taking horrible vengeance, were driven back. Buenos Ayres was established and garrisoned; but La Garay, who accomplished it, was murdered. By 1620, the vast territories which are known now as the South American republics were European possessions, and the Indian tribes were intruders on their native soil. The developments of commerce, the increase of population, and the large addition to our knowledge of natural history, which are among the subjects of congratulation supplied by Mr Hutchinson's book, are supplemented after a fashion which will be found very pleasant by that numerous class of human beings who can by no means understand Argentine politics and statistics, by a great deal of delightful information respecting the Indian tribes, who have not suffered any kind of change, apparently, except in the matter of cannibalism, since they ate Solis and his companions. There is much generic resemblance between them, but considerable special unlikeness, so that one can follow the narrator from tribe to tribe without tiring of them. The Chaco Indians, concerning whom many writers have drawn very largely on their imagination, both in praising and in stigmatising them, find fair treatment from Mr Hutchinson. He repeats the story, of which one is never tired, of their 'noble horsemanship,' and adds to it one curt little sentence, which conveys an extremely ludicrous picture: 'The women of the *haut monde*, among the Chaco Indians, ride as men do, and carry behind them a large plume of ostrich feathers, which presents a very curious appearance when the horse is at full gallop.'

No trace now remains of the brief influence of Christianity among the tribes, who, in 1610, received the first Jesuit missionaries, Cataldino and Mazeto, with warm welcome, after the long series of wars, tyrannies, treacheries, and cruelties they had endured from the invading Spaniards. The first Jesuit establishment was founded at Loreto, in the province of Guayra, which was the commencement of the famous Missiones, which extended between Entre Rios and Corrientes provinces, dividing the eastern portion of the Argentine Republic from the empire of Brazil. So completely has all their work perished, that it is hard to arrive at any knowledge of what their influence really was, yet there exists the curious and significant fact which Mr Mansfield tells us, that one hundred thousand Indians, professing Christianity, declared themselves ready to fight for their teachers against the officials and soldiers of King Charles III. of Spain, who were ordered to carry out the decree of banishment in the year 1767. Many of the aboriginal tribes are entirely extinct, but those of the Pampas and Gran Chaco are still numerous, and the 'Gauchos,' who are of mixed Indian and Spanish

Digitized by Google

blood, afford a curious study. They are spare and active, live entirely on meat, without bread, salt, or any kind of vegetable, and drink 'maté.' They gamble madly, and find in it their greatest delight. The women share this passion; the wife of a working Gaucho has been known to stake, and lose, every article of clothing on her except her chemise. Their achievements in horsemanship, and with the lasso and bolas, are truly wonderful; and their games of skill, dexterity, and daring, various and remarkable. The main cause of the popularity of the Dictator Rosas was his expertness in, and patronage of, Gaucho games. The Gauchos seem to do a great part of all the work done in the country, and a considerable share of the fighting. It is rather ungracious to describe them as being deficient in comprehension 'of the dignity or worth of human labour.' If they do the work, and other people profit by it, they may well be excused the absence of fine sentiments which there is nothing in their life or their surroundings to inspire. Elsewhere than in South America, the dignity and worth of human labour is more perceptible to thinkers than to workers.

'No sight,' says Mr Hutchinson, 'can be more picturesquely savage than a review of Gaucho soldiers. In 1858, General Urquiza, at that time president of the Argentine Republic, had reviewed before him an army of fourteen thousand. These Gauchos, especially the chiefs, were allowed to dress as they pleased; and therefore a great rivalry was generated between the commanders from the different provinces as to which would make the most brilliant turn-out before the captain-general. Ponchos of the most varied and flashy colours, calzonillas set off with the richest lace, most wonderful and gorgeous spurs, while the gear of the horses was adorned with a profusion of silver and gold. One Gaucho chief, from Cordoba, had his steed caparisoned with gold bedeckings to the value of fifty thousand francs.'

The semi-wild people may not be pleasant in real life, but they are much more interesting to read about than the Spanish and English colonists; and the country itself—the beautiful country of the Pampas, with its immense space, its suggestive grandeur, and its magnificent climate—is more interesting still. A ride over the plains, from Pavon to Rosario must be a delightful experience, for its real, and still more for its imaginary features. The mirage is frequent there, and as one rides along, the fresh 'pampero' blowing health and fragrance around, all sorts of fantastic images float before the vision, and break up the monotony of the vast plains. 'A white house appears like a ship at sea; and the troops of cattle, seen in this refracted atmosphere, as if their doubles were walking in air. The mirage is very temporary in location, and its position is constantly changing.'

The 'mataderos' and 'saladeros' (though these words mean slaughter-houses and salting-houses, they do not sound so ill) necessarily require a great deal of notice in a work on South America, and are very unpleasant subjects, except to those who make money by the repulsive processes carried on in them. It is much pleasanter to consider the immense expanse, the great natural beauty, and the presumably inexhaustible wealth of the Republic, which, with an area of 750,000 square miles, the greater part virgin soil, has a total population not equal to that of London. The over-crowded centres of toil may yet find an outlet in the direction of the vast Pampas, if all or any of the schemes detailed by Mr Hutchinson achieve a practical success. But first, the explosive order of politics must be abandoned, and at present there does not seem to be much chance of that. In the actual condition of things, the sparseness of population is an element in the beauty and interest of the country. The river voyage has glorious solitudes to offer to the eyes and the spirit of the traveller. From La Paz to Esquina, and thence to Goya, one hundred and fifty miles, the stillness and loneliness are most impressive. No noise of bird, or beast, or living thing is heard in the low marshy islands shadowed by lofty trees. Bright yellow and scarlet flowers glisten on the vivid green network of convolvuli which embraces the tree-trunks. The presence of strange animals, which are scared by the traveller, makes the solitude more impressive. The Gran Chaco is the wildest and most interesting portion of this huge territory, not only because of its hitherto unexplored botanical riches, but because there is the exciting feeling, in visiting it, that one is a trespasser on the Indian territory—a consciousness too nearly allied to the possibility of having one's scalp taken, to afford to the ordinary tourist all the pleasant excitement which Mr Hutchinson derived from it. He dwells rather complacently on the subject of this Indian territory. 'Everything to be met with in the Gran Chaco,' he says, 'speaks of its savagery, and tends to scare one. The relics of *toldas* (Indian huts) seen everywhere; the troops of wild horses; the frequent flitting by of ostriches; the screams of the parrot and caranecha; the twittering at night of millions of chattering insects; the desolate appearance of large whitish plains of salt or saltpetre, where once water has been; and the absence of anything like a purling stream, are its chief noticeable characteristics. In the profound stillness of the woods, where you take shelter from the almost tropical heat of a mid-day sun, you can find life under your feet in numerous ant colonies, in the burrows of biscachas (the Chaco rabbit), or the occasional presence of a beaver or armadillo. Now and then, you are conscious of an aguara, or American tapir, looking at you through the branches with an inquisitive though listless gaze, as if he wanted to know what business you had to come uninvited to his dominions.' Then there are the palm-trees, always beautiful, though less beautiful than in Africa, the rich scented orange-groves, and the clumps of grand forest trees, of immense height, and surrounded with the densest brushwood. The smaller forms of animal life abound; and in one instance, there is a remarkable contradiction to the ordinary experience of naturalists. The South American owls come out in the daylight: they are to be seen gravely watching by the biscacha holes under the blazing sun. Flocks of pheasants, woodcocks, and green parrots are constantly seen; and the insect world is numerously represented by some of its most beautiful and most aggravating varieties. One pleasant little creature, on whose pretty green body and shining black head Mr Hutchinson dwells quite fondly, 'sticks itself into any exposed part of our flesh, and, if allowed to do so, sucks our blood. The head is bent down to the work with the earnestness of a devoted student or mechanic, whilst the body is elevated, giving to the little beast the semblance of a ship on her beam-ends.'

The province of Corrientes is full of interest, from its past history and its natural features, though at present it is a scene of desolation, in consequence of the war. Its greatest natural curiosity is the lake of Ybera. According to Funes, several Indian tribes inhabited the islands in this lake, the greater part of whose immense extent of seven hundred square leagues is covered with wood and aquatic plants, as well as alive with boa-constrictors and crocodiles. Its waters rise and fall with the increase and ebb of the river Paraná, although there is no visible communication between them. The vast extent of this great lake is composed of clear water, pools, marshes, *terra firma*, bramble-beds, and quagmires. In parts of it there are large sheets of water, on which are floating-islands, that become changed in their position by a strong wind. The beautiful colossal water-lily, the *Victoria regia*, is found growing on all the lakes of Corrientes, in which province it is called by the native Guaranis the *irupe*, a pretty word, but which simply means 'a large plate.'

Mr Hutchinson gives as lucid an account of the political condition of the Republic, and of the war between Paraguay and Brazil, as any man can give of things which are inextricably confusing to foreigners, and must be extremely bewildering to persons on the spot. The only thing quite clear to one's perception is, that we must wait until it is all over, if it ever is, to understand the war, and wait until things are settled, if they ever are, to comprehend the politics of the Argentine Republic. Such a state of affairs is hardly realisable by us; but surely we may take anything for granted concerning a country, in which a tombstone, erected to the memory of a certain well-known individual, records that he was buried beneath it at a certain date, 'after being assassinated by his friends.'

POLLY'S LIFE.

I RISE in the morning early, and get the breakfast spread;
I wash and dress the little ones, and make their milk and bread;
I walk with them to school, and then come back to mother,
To help her in the kitchen, or to sew a shirt for brother.

I sweep the floors, and dust the rooms; I get the dinner ready;
And all the neighbours wish their girls were as neat, and clean, and steady;
The lads look after me, and say: 'Her eyes and teeth are jolly;
Her voice how sweet, how small her feet; no lady's like our Polly.'

So I bow and smile to Dick, and I laugh and nod to Harry;
But they're much mistaken if they think I e'er intend to marry;
They only see half of my life, the part that they think real;
Ah, when my working-day is o'er, I live in a world ideal.

And when at night 'tis time to go to my chamber next the skies,
They would be surprised if they could see how it looks in Polly's eyes;
The bare white walls are hung with pink (it suits my complexion best),
And velvet curtains fall to the floor; and how grandly I am drest.

With ribbons rare my raven hair is decked by my waiting-maid,
Or bound with pearls, or flashing gems, and wreathed in many a braid;
Rich lustrous silks are softened by folds of beautiful lace;
Bracelets of gold clasp my rounded arms, and earrings hang by my face.

And then with my fan, and flowers so sweet, I start for brilliant balls;
And lords and ladies are glad to greet the beauty that graces their halls;
Lord Walter claims my hand for a waltz, and we're soon among the dancers;
And then Sir Frederick calls me false, though I promised him the Lancers!

Too soon my chaperon, Lady Maud, says she really can wait no longer;
I whisper Lord Walter, I'll ride with him next week if I feel stronger;
We had walked in the winter-garden, he had plucked a rose for my hair;
I placed it myself in a china vase: I wake—it is not there.

But the six o'clock bell is ringing for the men to go to work;
The children are having a game of play (that Bobby *is* such a Turk);
And I make my father's coffee, and I wash the steps of the door.—
What shall I say to Lord Walter when we meet in the blue boudoir?

CHAMBERS'S JOURNAL

OF

POPULAR

LITERATURE, SCIENCE, AND ART

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 269. SATURDAY, FEBRUARY 20, 1869. PRICE 1½d.

SIX INCHES OF STEEL.

YEARS ago—how long I need not tell—I wished to learn the two prominent accomplishments of a gentleman of that day, fencing and dancing. A friend gave me the address of a tenant of his in Russell Square, a French refugee, who taught these arts. One afternoon I called and asked was M. Jacques at home. A stout, hearty-looking English girl opened the door, and replied that the old gentleman was in, would I 'come in here?' 'Here' was a small room on the right of the passage.

The heavy slipshod feet toiled up the stone staircase; I heard a door half opened, and the murmuring of voices, and then the slipshod feet toiled slowly up another flight, and a firm yet light tread descending told me that M. Jacques was coming.

The door opened, and a tall, white-haired, soldier-like figure entered the room, and the keen eyes swallowed me and my belongings at a glance.

'Good-day, sir. You are English; but, do you speak French?'

'*Un peu.*'

'Ah! I see, a very, very little; let us then talk in your tongue till by and by.'

Clearly, I did not speak French well, in M. Jacques' opinion.

'You desire me for what?'

'My friend, Mr Wilson'——

'Ah! your friend—he is a very good man—a gracious man; yes.'

'He stated that you could teach fencing and dancing.'

'Yes, that is true; I can teach fencing and dancing. Is it for that you want me?'

'It is. I desire to learn both accomplishments as speedily as possible.'

'Good; that is well: I like your energy. When will you begin?'

'Now, if it suits you.'

'Quite so. I am at your service.'

'But you have not mentioned the terms.

'Terms?'

'Yes. How much shall I have to pay?'

'Yes, to pay. I had forgotten. You shall pay me for four lessons, one guinea. Is it well? Are you satisfac—satisfacted?'

'Satisfied.'

'Yes, that is it. Are you satisfied?'

'Quite. I will take twelve lessons in each art.'

'Twelve lessons! Bah! you shall need little when you shall reach the ending of your course, if you have descent, as you call it here—blood—not bourgeois—you understand.'

'My father, sir, was a surgeon, the son of a poor county gentleman. I am'——

'*N'importe.* I can see what you are. I shall make you a good swordsman in a little time, if you will keep your eye on your adversary as you kept it on me when I made that speech to you. You have what you call "pluck." Is it right—"pluck?"'

'Quite right.'

'Then come, and we shall try your eye and wrist up-stairs.'

He went up-stairs, and I followed the old soldier. We entered a large well-lighted room on the first floor, bare of all furniture but a piano, then a rarer instrument than now, and a few chairs. On the piers between the windows hung some foils and masks, while some half-dozen single-sticks stood in the corner.

'Now, monsieur, will you place yourself there, as thus: with your body upright, and your arms hanging loosely to your sides, *comme ça.*'

The old gentleman put himself in position; as he did so, I noticed the slightest limp, the slightest possible, but still a limp—that I saw, as I watched him during the lesson, was from a stiffening of the knee-joint. I thought it was a curious thing to be taking lessons in the most active of exercises of an old gentleman who was lame, but I could see at once that he was a most perfect master of the weapon.

'That will do for to-day for the sword, monsieur; now for the dance, if monsieur is not too much fatigued.'

'Not at all—not the least.'

'Well, then, to begin. You know a little of the dance?'

Digitized by Google

'A very, very little—as little as of French, monsieur.'

'Ah! you shall know all better in a little.'

He took from off the piano a small violin and bow, and ran a rapid scale on the strings.

'Good. Now, place yourself *comme ça*. One, two, three. You see it is simple—first position, second position, third position—you see. No, no, monsieur, that second position is wrong, all wrong; *comme ça*. *Un, deux*, now—— *Peste!* my limb is troublesome to-day; I cannot dance.'

'Another day'—— I began.

'No, no; remain; we shall manage.'

He moved to the door, and half-opening it, called impatiently in French: 'Julie, Julie, descend quickly in your shoes.' In a few seconds entered Julie.

Julie! It is a long time now since I first saw Julie. Can I picture her? A tall dark girl, with black—intensely black—large eyes, child's eyes; a small mouth, full lips, and a form thin, bony, and lithe as a grayhound's; dressed in a low child's dress, much too small and short for her. She was like a child of ten, seen through a glass that made her the size of a girl of eighteen. 'Mademoiselle de Bonheur—Monsieur Arthur Forrester.'

She courtesied low, in the style then in fashion; I made my best bow. 'Julie, my limb is to-day weak; I cannot teach; you shall teach this gentleman his dance.'

'Oui, mon père.'

'Now, begin. Un, deux, trois. Regard mademoiselle's feet, monsieur; it is her feet that dance. Un, deux, trois.' And so on for nearly half an hour, during which the eternal 'Un, deux, trois' was occasionally interrupted by little snatches of the strings with the fingers, and sudden sweepings of the bow over the instrument. 'Good, monsieur: you have life, you have soul; you shall yet dance—you feel the music. It shall be creditable to me to have taught you.—Julie, you shall wish monsieur good-day.'

'Bonjour, monsieur,' said Julie; and with a low courtesy she left us.

'And when will you come again?'

'The day after to-morrow I can come.'

'Bien; come then. I shall hope my limp will then be well. Bonjour, monsieur;' and the old gentleman rang the bell and bowed me out.

The day came, and I went again, and was directly shewn up-stairs into the room.

'Ah, monsieur, we are unfortunate; my limb is no use. This climate of yours is bad for old soldiers; my wounded limb aches for want of the sun.'

'I shall be glad to call another day, if more convenient.'

'No, no; it is of no consequence; Julie will teach you. Will you be so kind as to open the door for me?—I am crippled.'

'Certainly.'

'Julie, Julie!' thundered the old man; 'descend quickly, with your shoes and your *corsage*.'

Julie came in speedily, and with a small leather breast-guard in her hand. 'Bonjour, monsieur.'

'Bonjour, Mademoiselle Ju—— de Bonheur.'

'See, now, you shall take your lesson from mademoiselle,' said monsieur, as he buckled on her leather armour and fitted her mask. 'Now, salute. Julie, salute.' Julie went through the motions with an ease and grace that excelled her father's. 'Now, you must regard the hand of mademoiselle; the time has not come to you to watch her eyes. Now, *en guard*. Good. Carte—thrust.'

I thrust as gently as possible, while Julie, with the foil in her left hand, slipped the fingers of the right along my blade to aid the bend—in true fencing style.

'Bah! Monsieur, do not fear; it has not arrived to you yet to be dangerous to mademoiselle. Again, that. You must lunge with your body, and of mademoiselle have no fear; she can guard herself. Your nails up a little more. Now, the carte—thrust. That is better. Again.'

The situation was horrible; to be compelled to thrust full in the chest of this child; but there was no help for it, and I did it; and so we went on through the whole of the motions—prime, second, quint, parade, low carte, and the rest of it—Julie placing herself in the proper positions, and thrusting and guarding with a vigour and grace that more than equalled her teacher's.

After the fencing came the dancing, with its 'Un, deux, trois,' and a repetition of the caution that mademoiselle's feet should be regarded, as it was with those she was teaching.

The limb continued weak for some time, and the lessons continued to be given by Julie, and as my eyes began to get accustomed to look on hers through the haze of the wires of the mask—for I had become practised enough to be permitted to cross foils with her in real attack and defence—I saw a change had come over them; the child was growing a woman: there was no longer the stare of childish curiosity, or the simple glance of the practised fencer; there was more, the woman's soul waking in them. Her form altered; the angles were becoming rounded, the grace was more graceful, but the thin tightly stretched skin on the face and shoulders, that altered but little.

One day I bought a box of chocolates for the old gentleman, who was at last well enough to take the foils; he ate some, and gave the box to Julie, and we went on with our lesson, she remaining in the room for the dancing. When the lesson was over, he said: 'Ah! how I will enjoy one of your little chocolates.'

Julie started as if from a dream—the box was empty. He laughed, and said: 'Ah, my child, you are so fond of chocolates, you have not left your father one. *Ah, coquine*'—and he pinched her ear—'ah, greedy one!'

She blushed, the tears started in her eyes, she said nothing.

'Bah! Now, monsieur, I have broken my string.—Julie, go get me—— No; you don't know where; I'll myself go.—Mademoiselle shall play you some music while I am gone, monsieur; in a few minutes I shall return.'

The old man left the room with his instrument, and Julie turned to the piano and sat down. As I opened it, she said, with her voice full of tears: 'Monsieur, you must not think me a greedy child.'

'But,' said I laughingly, 'you ate the whole box.'

'True, monsieur; but since last Sunday I have eaten nothing but some bread—since yesterday, nothing. I am not greedy; I was only hungry and forgetful.'

'My God, mademoiselle! what can you mean?

Digitized by Google

You are destroying yourself. Why did you not eat —at your age?'

'At my age! There was nothing to eat; after Mary had eaten, there was nothing to eat.'

'Heavens! Poor child! is this possible? I, wretch that I am, have never once offered to pay your father what I owe him; why, I have had one course of lessons after another, and paid for none. Why did not your father speak—remind me?'

'Monsieur de Bonheur would die first.'

'I will pay this moment. Fool that I was, not to see it in your face!'

'Am I then *so* thin?'

'Thin! poor child!'

'Child! I am seventeen, monsieur.'

'Seventeen, mademoiselle!'

'Oui, monsieur; j'ai dix-sept ans.'

'I am very sorry; I will at once see your father.'

'Do not disturb yourself so much, monsieur; it is nothing. If it had not been for the chocolates, you would not have known about it at all, but I could not let you think me a greedy child. You will not speak to my father, as if I had told you? Promise me. He would never forgive me.'

'Mademoiselle, I promise.'

The old gentleman now entered with the new string properly adjusted, and once more we began the one, two, three, four.

'*Machinalement*, Julie, *machinalement;* monsieur is to *learn* to dance, not to dance for his pleasure. Again that. Un, deux, trois, comme ça.'

And so we went through the minuet and the new waltz, to the scraping of the violin; and whenever we moved a little too much, as though we were dancing for pleasure instead of practice, the old gentleman's 'Machinalement, Julie, un, deux, trois,' speedily brought us to task level.

At the close of the lesson, I stated that I was uncertain about being able to come again for some time, and should be glad to discharge, as far as money could, my obligations to him.

'N'importe, monsieur; when you have completed, will be good.'

'I must beg you to allow me to settle the matter now.'

'Bien,' said monsieur, with a shrug, 'if you wish it;' and he dropped the guineas without counting them into his waistcoat pocket, with an air of indifference that would have been laughable but for the story I had just heard from poor Julie. I left the house, and waited at the street-corner to see what would happen; and in a few minutes I saw the English girl come out with her basket, and presently return with something in the basket, and on the top a little bottle of foreign make; and then I left, determined that while my ignorance of fencing and dancing could prevent it, Julie should never eat another box of chocolates from sheer hunger.

It was more than a week before I again went to the house. The change was complete; Julie was a woman, a beautiful brilliant woman. Food had acted on her as by magic. Her dress too was altered, higher in the throat, lower in the skirt, but still short enough to shew the most delicate foot and ankle I ever saw.

The old man saw no difference. When the limb was well, I fenced with him while Julie played; when the limb was bad, I fenced and danced with Julie, with only an occasional 'Plus machinalement, Julie; un, deux, trois.' And so it went on for months, till the old gentleman said to me: 'Monsieur, it is time for you to leave us. You are a good swordsman: it is only practice that you need to be one of the best. I can no longer take your money for teaching you, as I can teach you nothing.'

I pleaded for just one more course of lessons: I could not yet disarm.

'True, monsieur, you cannot; you shall have one more course of lessons. My wrist is now getting stiff, as well as my limb; but Julie's is of steel. She shall teach you. When you can disarm Julie, there is no more we can teach you.'

I don't know how it happened, but just at this time, when my admiration—I don't say love, but admiration—for Julie was at its highest point, I fell in love, literally headlong; not a moment's warning was given me. I went to my mother's one evening, and on entering the room, saw my destiny.

I went to take my lessons as usual, but I took no interest in them. I was changed; and never did I get fiercer thrusts in the fencing lessons. Six or eight times, my foil sprang out of my hand, as if I had been a novice. I was nettled. What had made Julie so angry? There was a flash in her eye. What had I done or said to cause it? I gave up guessing, and attended to the lesson once more. Her foil, like a lithe serpent, seized mine, and threw it with a loud clang against the wall.

'Doucement, Julie; doucement, ma fille; doucement. Monsieur is fatigued. You had better cease.'

And never once during the dancing lesson that followed was uttered the usual 'Machinalement, Julie;' all the life and energy seemed to have left her.

The next lesson presented the same features, a little more subdued.

Between the third and last lesson, I happened to meet Julie and her father in the street; I bowed; and my companion asked who they were.

'My fencing-master and his child.'

'Child! Arthur.'

'Daughter, I should have said. I'm going there to-morrow for my last lesson.'

'Oh!' And my destiny was more silent than usual during our walk home.

On the morrow, I went to Russel Square; and before we had been engaged ten minutes, the old gentleman was called away to see some visitor. He left the room with an apology to me, and I turned to renew my contest with Julie. She had thrown aside her mask, and was standing with the point of the foil in her left hand.

'Now, Julie,' said I—for insensibly we had dropped into the way of calling each other Julie and Arthur—'now, Julie, once more.'

'My name is Bonheur, monsieur; Mademoiselle de Bonheur. Who was that blonde Englishwoman I met you with yesterday?'

'Who was it? That lady, Julie, will be my wife in less than a month.—What 's the matter, Julie? Are you ill?'

'It is nothing. Take off your mask: we need not always play like children, monsieur.'

I threw it off into the corner of the room, and we began. I was quite cool; she, evidently under the influence of some strong passion, with amazing energy. Therefore she lunged at me with all her force and skill, and I felt once, as the point of her foil glided down mine, that though the leather was there, *the button at the end was gone.*

Digitized by Google

'The button of your foil is off, mademoiselle.'

'I know it, monsieur; I have taken it off. Now, monsieur, you shall be married in a month, but not as you are. It is your fair, false face she loves; but it shall not be fair: she shall find marks on it that will change it! It *shall* not be the face that *I* know so well that shall be hers to caress! No, no.'

'But, Julie'——

'Be guarded, monsieur; the foil has no button. I doubt if you shall live a month.'

And she attacked me with a fury that made me need every artifice she had taught me to ward off her thrusts. At last, it came carte over the arm; I parried badly, and the pointed blade ripped up my arm from wrist to shoulder.

The moment she saw the blood, she threw away the foil, and rushed towards me. I sank on to the couch fainting from loss of blood, with just strength enough left to say: 'Break off the point, Julie, dear,' and then swooned.

When I came to, my arm was bound up, and I heard her sob as I lay with my mind awake but my body motionless: 'Oh, my Arthur! my love! I have killed you! I have killed you, for whom I would have died! Oh, wretch that I am, he will die—he will die!'

She laid her face on my breast, and shook me with her sobs. 'Don't cry, Julie, don't cry; it was an accident, I know, and'——

'No—you will live—you must live to forgive me. It was not an accident—I meant to kill you, wretch that I am!'

I could only say: 'Don't cry, Julie, dear. What do they say? Where is the point? Give it me.'

She gave me the broken-off part of the foil. I saw it had been rubbed on some stone till it was as sharp as a needle.

When M. de Bonheur returned, he brought with him his visitor, who by good fortune happened to be an old comrade of his.

'Well, are you better now? How did it happen?'

'The point of the foil broke off, and the edge took me on the wrist as I lunged.'

'Bah!—Julie, you must have guarded very badly to do that. Where is the foil?—Yes; I see the point is broken off. Where is the point?'

'It must be about the room.'

The visitor looked at Julie, and said: 'It does not matter; it can be found by and by, when this gentleman has gone. He will be strong enough in an hour to go—meanwhile, let him rest a little; Julie can take care of him.'

'Ah, Julie, but it was an awkward guard of yours, and the foil too must have been bad; I shall have to complain to the maker.'

Poor Julie sat by me, quite penitent and quite forgiven, for an hour or more, and when we heard them coming, I turned to her and said: 'I quite forgive you, Julie, dear; you must love me still like a brother, as I shall love you like a sister.' And then—well, there's no harm in these things between brothers and sisters—and then I went home, rather faint and weak, to explain matters, and meet my destiny.

As for Julie, the family property of the De Bonheurs was restored to the old gentleman some months afterwards, and they quitted England; soon after which I received from the Marquise de Charenton a letter which I at once burned, beginning, 'My dear Brother,' and ending, 'Your most affectionate sister, Julie.'

Among the treasures of the past which I, like others, keep so carefully and so secretly, there is a packet that contains six inches of steel, and on it is engraved but one word—'Julie.'

ST PAUL'S.

IN TWO CHAPTERS.—CHAPTER I.

THE late Dean Milman has left to his fellow-countrymen a most fitting bequest—the annals of his own cathedral. If it is not so interesting as the records of Westminster Abbey, so lately compiled by Dean Stanley, the fault is in the subject, not in the writer. St Paul's has not the general interest belonging to it which surrounds its sister structure. Its history is essentially sacerdotal; and, except in late years, the bones of our mightiest men were not interred within its vaults. The struggles of which it was the scene were for the most part what at this distance of time appear almost party conflicts; although the events that resulted were often of enormous consequence—at all events to those immediately concerned. A great many good folks were burned to death, for instance, upon doctrinal points, which do not, now-a-days, seem very important, but which the state, by the mouths of the preachers at Paul's Cross, pronounced to be indispensable, at all events to the salvation of the body. Dry, and comparatively dull, as is the early part of this instructive volume,* one almost prefers it to the terrible details of religious cruelty which light up the central portion of the narrative as with the glare of the Smithfield fires.

It is not known with any exactness at what period St Paul's first became a spot devoted to religious worship, although, from the report of Camden and others concerning the excavations which took place there in the reign of Edward III., when 'stags' horns, boars' tusks, and instruments and vessels thought to be sacrificial' were found, it has been supposed that a temple of Diana once occupied the site. That there was a catacomb beneath, or on the declivity of the hill, seems, however, certain, which doubtless contained the remains of successive masters and inhabitants of London. 'Upon digging the foundation for the fabric of St Paul's, Sir Christopher Wren found under the graves of the latter ages, in a row below, the burial-places of the Saxon times. The Saxons, as it appeared, were accustomed to line their graves with chalk-stones, though some more eminent were entombed in coffins of whole stone. Below these were British graves, wherein were found ivory and wooden pins of a hard wood, seemingly box, in abundance, of about six inches long. It seems the bodies were only wrapt up and buried in woollen shrouds, which, being consumed, the pins remained entire. In the same row, and deeper, were Roman urns intermixed. This was eighteen feet or more, and belonged to the colony when Romans and Britons lived and died together.'

It is probable that Mellitus, the companion of Augustine, who fixed his episcopal see in London, first used the spot on which St Paul's now stands as a place of Christian worship; and in obedience to the wise counsel of Pope Gregory the Great—that places hallowed by the religious feeling of

* *Annals of St Paul's Cathedral.* By Henry Hart Milman, D.D. London: Murray.

Digitized by Google

the heathen were to be thus utilised—he perhaps turned what was a heathen temple into an orthodox fane. His fourth successor was Erkenwald, whose munificence towards the fabric was such, that his memory was long held in higher honour within the cathedral than its patron saint himself. The Saxon kings that followed him abetted his efforts, and Canute the Dane (we have authentic proof) ratified their splendid donations. But of this first edifice (in which Lanfranc certainly sat in convocation at the head of his clergy) we have no detailed record, except that we know it was destroyed by that enemy which was destined to overcome it again and again—fire—in 1087. One of the last acts of William the Norman was to contribute stone towards the rebuilding of this structure. In Henry I.'s reign a great portion of it seems to have been burned down once more. In Henry II.'s time it was sufficiently restored to admit of a solemn scene before its high altar, namely, the excommunication of its own bishop. 'It was, as it seems, during the solemn service at St Paul's that an emissary of Becket had the boldness to enter the cathedral, to advance to the altar, and thrust the roll bearing the sentence into the hands of the officiating priest, and to proclaim with a loud voice: "Know all men, that Gilbert, Bishop of London, is excommunicated by Thomas, Archbishop of Canterbury." He escaped, with some difficulty, from the ill-usage of the people.'

The next striking incident within the walls of St Paul's was the arraignment of William de Longchamp, the chancellor, for many atrocious and tyrannous crimes, including ill-usage of the Archbishop of York. Prince John (his brother Richard being in the Holy Land) presided, and all the bishops met in the nave. In the same reign, Paul's Cross first became remarkable as the place from which William Fitz Osbert poured forth his inflammatory harangues against the crown. He seized and held the tower of St Mary-le-Bow, and being hard pressed, set fire to that sacred edifice, dedicated to the Virgin; they dragged him out of the flames only to carry him naked through the streets, and burn him alive in chains, as a caution against democratic principles. Paul's Cross thereupon, we read, without much wonder, 'was silent for many years.'

This spot was more historic than even the cathedral itself, outside whose walls—at the north-east corner—it stood. It was originally, perhaps, like other crosses, set up at the entrance of the churchyard, to remind the passers-by to pray for the dead interred within. But at an early period a pulpit was erected of wood, on a stone base, with a canopy of lead. These were supplanted by a more splendid stone cross with a pulpit, of whose grace and beauty London was justly proud. The discourses from Paul's Cross ruled the public mind more than ought that was preached elsewhere. 'Except the king and his retinue, who had a covered gallery, the congregation, even the mayor and aldermen, stood in the open air.' Here papal bulls were promulgated; here excommunications were thundered out; here sinners of high position did penance; here heretics knelt and read their recantations, or, if obstinate, were marched off to Smithfield.' Nor was it only with church matters that it was connected; royal edicts were published here; kings proclaimed and traitors denounced. What strange scenes must that north-eastern corner of St Paul's have witnessed! The Reformed religion was in fact proclaimed here, and afterwards recanted. On the latter occasion, when the preacher began to inveigh against Ridley, a dagger was thrown at him, and a riot raised. Ridley himself had preached there a few years before in a manner little to his credit. On the accession of Lady Jane Grey, he had denounced both the sisters, Mary and Elizabeth, as bastards. Then, when Jane's cause was lost, he had stolen away in a dastardly manner to Cambridge, in order to make his peace—but in vain—with Mary. Many of our so-called martyrs appear here in indifferent colours; though, indeed, their persecutors were more base, more mean, more cruel. From the reign of Henry VIII. to the end of that of Elizabeth, these Annals are stained with blood, and smirched with fire. Scarcely a bishop on either side but exhibited a slavish awe when his party were depressed, and a tyrannous brutality when it became uppermost. It is a sad page of human nature.

Perhaps the most terrible scene of which St Paul's was witness, was the reading of the Interdict pronounced against the whole realm in the reign of King John; 'when London heard the fearful office which shut all the churches of the land to the devout worshippers, and deprived them of the prayers, the masses, all the spiritual blessings and privileges of the church. Infants lay unbaptised, except with some hasty and imperfect ceremony! Joyless marriages were hurriedly performed in the church porch: the dying yearned in vain for anointment with the blessed oil and for the holy Eucharist; the dead were buried in unconsecrated ground; when day after day the bells ceased to toll, and the few citizens passed by or pressed in vain against the inexorably closed doors of the silent church.' Characteristically enough in those days of respecting of persons, 'the Bishop of London, who, without resistance, had pronounced the fatal ban against his whole diocese, had fears or conscientious scruples about the sentence against the king. The godless John alone remained unsmitten, untouched.' The greatest humiliation that this realm ever suffered took place before the altar of St Paul's, when the interdict was removed, and the legate of the pope received the cession of the kingdom as a fief of the holy see. The English clergy, with the exception of the Archbishop of Canterbury, who 'could not suppress his deep groans during the ceremony,' submitted patiently to this outrage; but when another legate, in the succeeding reign, preached the first sermon of which we have any report, at the cathedral, his insolent words went not unanswered. The Holy Father had been so indiscreet as to meddle with vested interests, and when his ambassador came to the new canon, which required a dispensation from the pope to hold pluralities, there arose from the dignified ecclesiastics who surrounded him 'a low and ominous murmur.' Cantelupe, Bishop of Worcester, took off his mitre, and, in the name of the clergy of England, made his solemn protest. 'Many of the prelates of England were men of high birth. They had been wont, by holding many benefices, to maintain their dignity, to shew generous hospitality, and to be prodigal in alms-deeds. Some were old; they would not consent to be robbed of their income, and reduced to ignominious poverty. Some were young and bold, and would endure a hard struggle before they would surrender their rights. For myself,

Digitized by Google

before I was a bishop, I made a firm resolution not to be so plundered.' And *that* matter was reconsidered by the Holy Father.

In 1250, Primate Boniface (the nominee of the pope, and a foreigner), having obtained from Rome a grant of first-fruits from all the benefices in his province, and spent them, set forth on a visitation, 'not, as it was said, for the glory of God, but, as too plainly appeared, in quest of ungodly gain. He appeared in London, and treated the bishop and his jurisdiction with contempt. The Dean of St Paul's stood by his bishop. 'The primate appeared with his cuirass gleaming under his pontifical robes. The dean closed the doors of his cathedral against him. Boniface solemnly excommunicated Henry, Dean of St Paul's, and his chapter, in the name of St Thomas the martyr of Canterbury. The sub-prior of St Bartholomew's (the prior was dead) fared still worse. He calmly pleaded the rights of the bishop; the wrathful primate rushed on the old man, struck him down with his own hand, tore his splendid vestment, and trampled it under foot.' A strange scene in the sacred edifice, truly.

In 1458 occurred on the same spot an imposing spectacle, though fated to bear no fruit. It was the solemn reconciliation of the claims of York and Lancaster. 'There was some dread of a collision between the hostile and ill-accordant factions. King Henry and Queen Margaret slept at the Bishop's Palace in the precincts. The great lords assembled in the chapel of that palace. The king, holding his full court, surrounded by Yorkists and Lancastrians, sat on a throne. The Archbishop Bourchier set the crown on his head. The procession to the church, preceded by the archbishop, his cross borne before him by the Bishop of Rochester, was met by the dean and chapter. Two and two came those terrible nobles, so soon to meet again in deadly battle—the Duke of Somerset and the Earl of Salisbury, the Duke of Exeter and the Earl of Warwick. Then came the poor king, crowned, with the sceptre in his hand. The queen followed smiling (oh! the bitterness of that smile), and "conversing familiarly" with the Duke of York. They knelt in prayer—one at least, the king, on his faldstool—in devout, earnest, Christian prayer. The nobles were on their knees behind. High mass was sung; the archbishop pronounced the benediction—"Go in peace!"—a benediction which had but a brief effect indeed. 'Thirteen years later, the body of the hapless Henry—not without strong suspicion of foul play—was displayed in the cathedral. Blood gushed from the king's nose—which was held a corroboration of this dark belief. Twelve years afterwards, Jane Shore did penance in St Paul's.' Her beauty appeared extraordinary as she walked in very scanty attire with a cross before her, and a paper in her hand, 'the gaze of the people flushing her fair cheeks with exquisite colour. They thought less of her shame than of the cruelty of the Protector.'

Perhaps they did, and certainly well they might. But nothing is so striking and so sad as the blindness of these days to the sense of justice, if only it was outraged by persons high enough in power. Even in the very few who exercised liberty of conscience, there seems to have been little of what we are now accustomed to call 'principle' of any sort. Dean Colet—whose intellectual qualities were for that time a perfect marvel—thought it no harm to hold, while yet only in subdeacon's orders, a living in Suffolk, and prebends in York, Salisbury, and St Martin's-le-Grand. Yet our author truly says, 'the more the veil is withdrawn from the mind and character of Colet, the more does he stand out as beyond his age.' Besides his striking lectures on St Paul, certain treatises of his upon the Book of Genesis have been unearthed in the Cambridge Library. 'If on St Paul, Colet rigidly adhered, not to the letter (he was far beyond the notion of plenary verbal inspiration) but to the sense of the apostle, we find him in a far more free spirit treating the first chapter of Genesis as a noble poem, designed by its author, Moses, to impress upon a rude and barbarous people the great truths of the creation of the world by one Omnific God. The description of the successive acts of creation is followed out with singular ingenuity; and these and the periods of time have in his view a profound religious scope, but in themselves are only pious fictions to commend the great internal truths.' Here follow some extracts, which might have been published yesterday by some 'Broad Church' Divine, and of which our author may well remark: 'Strange that the Dean of St Paul's in the nineteenth century should find the views which he has so long held, so nearly anticipated by the dean of the sixteenth.' Colet, indeed, was by far the most remarkable person immediately connected with the subject of this volume. Had he lived a few years later, he would undoubtedly have been burned alive by Papists or Protestants, and been considered a martyr by neither party. He even ventured to declare in his own cathedral—and after a convocation therein had that day condemned three-and-twenty Lollards to abjure or be burned in Smithfield—that the lives of wicked priests were the worst heresy. Again, when wilful, passionate Henry VIII. was wild for war, Dean Colet preached before him on the victory of Christ, and against wars waged from hate or ambition. Before Wolsey, he preached against pride. The great Erasmus describes Colet as one of the two most perfect Christians whom the world, in his time, had seen.

It must be remembered that throughout this same dean's time there was nothing like simplicity (far less rationalism) in religious matters: the cathedral in which he preached was still adorned with its ancient shrines, and lit with its ever-burning tapers. St Erkenwald still held his splendid state, as in the old times when Richard Preston left the saint his best sapphire to remain for curing infirmities of the eyes; the body had been translated from the crypt with infinite pomp by Stephen, and was deposited immediately behind the high altar; a grate of ironwork of exquisite workmanship protected it (and its treasures) from the too familiar devotion of the faithful; and 'no wonder, for the very dust, mingled with water and drank, wrought instantaneous cures.' Before these shrines 'the greatest paid their devotions and made their oblations. King John of France, the captive of Poitiers, made his orisons in the cathedral of the metropolis of England; his offerings were those of a king, not of a prisoner. Twelve nobles at the Annunciation, twenty-six at the crucifix near the north door; as he approached to the high altar, he presented four basins of gold. He gave to the dean five florin nobles, of which the petty canon officiating (John Lillington) had his share.' He gave St Erkenwald twenty-two nobles. Near each crucifix and altar was a strong iron box, or pyx,

Digitized by Google

in which the oblations were deposited: those on the high altar were assigned to the dean and chapter. According to archives now in existence, the box under the great northern cross yielded fifty pounds a month, or, according to the present value of money, nine thousand pounds a year. What a profitable investment must popular St Erkenwald have proved! But St Paul's was not wanting in other objects of 'devout worship. Dugdale has preserved from older days two lists of the inestimable treasures of reliques, one drawn up by Dean Radulph de Diceto, as belonging in his time to the church. The other is of a later period. Of the first list, the most remarkable are a knife of our Lord, hair of St Mary Magdalene, with bones and part of the dresses of saints and martyrs, and the dust of other reliques. But they advanced in wonder. In the second list is some of the blood of St Paul, hair of the Blessed Virgin, the hand of St John the Evangelist. Another reliquary contained the milk, the vest, and more hair of the Holy Virgin. Another had pieces of the skull, and part of the dress, of St Thomas of Canterbury. Another the head of St Ethelbert, king and martyr. The whole body of St Mellitus, of which the cathedral once boasted, seems to have dwindled down to his two arms, one large and one small.

'These reliques were encased in reliquaries of crystal, adorned with gold and silver work and precious stones, some of them, no doubt, of exquisite workmanship. The crystal vase which contained the milk of the Virgin was supported by two images of St Peter and St Paul, incensing the vase, and a certain angel. The base was of silver gilt, having on its three corners three lions, on the fourth, a dragon supporting the vase. The jaw of St Ethelbert, the Confessor and founder of the church of St Paul's, was in a case, silver gilt, adorned with three great precious stones, four of a moderate size, ten smaller, and above two round crystals; but there were not more than four teeth in the jaw.'

But the time was coming when all these geese with the golden eggs should cease to lay.

A PERFECT TREASURE.

CHAPTER XV.—ON HERSHELL REEF.

Was it well for me to leave to others, not his kin, the task of following my beloved benefactor to the grave? Or was it well to neglect his last commands during that precious time in which alone I might be able to obey them? The delay of even a single day might offer to the Hindu an opportunity for flight, which would place him beyond the reach of my outstretched arms for ever. On the other hand, to quit that roof, which had been my happy home so long, while its late master yet lay beneath it, was most abhorrent to my feelings. Mr Glendell, as I expected, took the practical view of the matter.

'If your poor uncle were dying, Marmy, your presence, even if you could do him no good, would be a comfort to him; and I would not have had you deprive him of it, for any amount of material profit; but since he is dead, it seems to me you can do no better service to him than that of carrying out his express injunctions.'

On the whole, my own judgment tallied with this verdict; but the thought that it was no longer my uncle who was interested in the recovery of the Hindu, but myself alone—that the pursuit on which I was about to enter had my own advantage for its end, held me still irresolute. I turned inquiringly where I knew worldly prudence would have no grain of weight if loving duty were indeed in the opposite scale—to Rosa.

'It is a question for yourself alone to answer, Marmy,' said she quietly, 'and not for us. If you are secretly aware that the idea of personal profit chiefly actuates you to leave him yonder'—and she pointed to the chamber of death—'rather than his own mandate, then I should bid you stay, for the sense of such a misdeed might be a ghost to haunt you, such as no worldly prosperity could ever lay.'

'I am quite conscience clear,' said I earnestly, 'in that matter, Rosa. But to leave him thus'——

'He is not here, Marmy—he is in heaven,' answered the young girl softly. 'The empty house of clay which he has quitted will, you may trust my father, have due reverence, even though you do not watch beside it; and when it is borne to the grave, it shall not lack at least two true mourners.'

I took her hand, and pressed it fondly. 'I will go, Rosa: that is the best and wisest course. I know not how long I may be away'—I was going to say 'from home,' but the word stuck in my throat; 'the Point' seemed home no longer, now that it had lost its master. 'I know not whither this search of mine may carry me—perhaps across the seas. But I will find this man, if he is above ground; so help me Heaven!'

'Amen!' said the little doctor cheerily. 'Folks may say that colour is but a matter of fancy, but I, for my part, would never knuckle under to a black man, nor yet to a whity-brown. Trust to me and Rosa for having all things as you would wish them to be at Hershell; and be off at once. There is every reason for haste. I have found out from Martha, who is outrageous against the Hindu for taking himself off at such a time, that he has spoken to her of late about returning to India. There is a ship, I know, about to start from Daisyport for Calcutta, and I should not wonder if he tried to get a passage in her. You must catch him where the warrant can run, which, for all I know, it cannot do upon the high seas.'

'If I catch Sangaree Tannajee,' said I between my teeth, 'I'll answer for it I'll bring him back, warrant or no warrant. I shall take one of those persuaders with me which I have already found so influential with this scoundrel.'

'That 's not right,' interposed Rosa firmly. 'You must only do what the law empowers you to do. Suppose this man is obstinate, and you are equally determined? Oh, pray, pray, Marmy, for my sake, do not take your pistols.'

'Rosa is right,' said the doctor reflectively: 'you might get in a passion with the scoundrel.'

'I shall not do that,' said I savagely; 'I am past passion.'

'Dear Marmy,' urged Rosa solemnly, 'is it possible you can persuade yourself you are obeying your dead uncle's wishes in acting as you propose? Would *he*, who has borne with this poor wretch so patiently for years, and who, we almost may say, in preserving his life, has just lost his own, approve of such a course of conduct as you are now contemplating? Come; give up this mere longing for revenge, which belies your nature, Marmy, and keep within the pale of right. Who are you, even

Digitized by Google

if you could do so with impunity, that you should thus play the part of a despot, of a tyrant, and towards so despicable an object?'

'I was wrong, dear Rosa,' said I ruefully; 'and you shall keep my pistols for me—although I did but intend to frighten the rascal with an empty barrel.'

But in reality I knew not what I had intended to do, and even now, under the influence of my darling's gentle sway, I was scarcely master of myself. The awful event of the last night had of course unhinged me. It was the first time in my life I had ever been thrown upon my own resources. The simple commonplaces of home-life, and the quiet pursuits of literature, were about to be suddenly exchanged for—I knew not what poverty, toil, and failure; or perhaps for sudden affluence, the very source of which, at present hidden from me, I was as eager to discover as any lad in the Arabian tales, thwarted by some malignant Jin. And I was not afraid of my Jin; I longed to meet with him, that I might clutch him by the throat, and bid him disgorge that secret, the mystery of which seemed to possess me wholly, now that it had come by inheritance mine. Perhaps I should not soon have disentangled myself from this web of thought, had not Mr Glendell swept it away from me with: 'The gig and mare are at the door, Marmy; and my man shall drive you first to the nearest magistrate, to get the warrant; and then on to Daisyport.'

'Thanks, thanks,' cried I, grasping the doctor's hand.—'Good-bye, dear Rosa.'

Then I had one more 'good-bye' to say to one who could not return it. I took my last look at that dear face, which had always worn a smile for me (and wore it yet), and kissed its cold white lips; then hurried into the little hall.

'Here is money, Marmy,' said Mr Glendell, putting in my hand a well-filled purse, 'without which the mare cannot be made to go: we will square accounts at another time.'

I had actually been about to start without a single sixpence.

'Master Marmy, Master Marmy, you've forgotten your luggage,' cried Martha, running out with a carpet-bag, into which, by Rosa's orders, she had put a few things, as I climbed into the gig. 'And here's some of your poor uncle's wraps, as he'll never want more; for you'll find it main cold upon the downs.'

And it *was* bitter cold. The north-east wind blew upon the high and open down-land with a force that the game little mare could scarcely make head against, and the view to seaward shewed a mass of tumbling foam. But the sharp coolness was pleasant to my fevered brow, and lightened my laden brain. For the first time since the previous night, I began to think clearly. The visit to the magistrate also did me good. His cut-and-dried phrases of condolence, his matter-of-fact questions, and even his superfluous advice, all helped to bring me to myself; and long before we had reached our destination, I had formed a definite plan. We inquired of all whom we met respecting the runaway, but could glean nothing; indeed, he had had so many hours' start of us that this was hardly to be expected. But my first question at the inn where we put up—the same at which I had dined with the fascinating Mr Swete—was concerning the ship of which I had heard as about to leave the port for India. The people of the hotel exhibited the usual ignorance of their class respecting anything not immediately connected with their own calling; they 'really could not say;' but there was a local paper in the coffee-room, which would doubtless contain the shipping intelligence of the place. This periodical was, however, mislaid. I hurried to the docks, and made my inquiries at head-quarters. The *Star of the West* had sailed that morning for Calcutta. It was to have started the day before, but the weather had been too tempestuous. True, it was stormy enough to-day; but the wind had changed, which before had been directly adverse to the ship's course.

'Had a passenger—a Hindu—joined the vessel?' inquired I, 'at the very last moment?' My limbs trembled as I asked this question, and I could hear the beating of my own heart. I should have thought it would have been easy for the most unobservant to perceive that my business was of the last importance; but the clerk only settled down to his work with a surly: 'How should I know? This is not the passenger department.'

I could have leaped across the counter and strangled him; but I managed to ask with civility where the passenger department was. 'Next dock,' answered the man with irritation. This jack in office could, as I subsequently learned, have answered my question readily enough, but he would not compromise his dignity. The passenger department was an inferior branch of the Company's offices. What unnecessary suspense and pain does man in his brutal egotism inflict upon his fellow-creatures! The booking-clerk was, on the other hand, a communicative young fellow enough. —"Yes indeed: a fat Hindu had gone on board the ship not an hour before she set sail. A pretty voyage he was likely to make of it. He looked sea-sick before he started.—When would another vessel sail for the same destination?—Oh, immediately. The consort of the *Star of the West* would start that day fortnight.—Couldn't say which was the fastest: all the Company's ships were fast ones —clippers.—Didn't know as to the state of sailing of other Company's vessels; but he knew one thing—that none of them would catch the *Star*. She had a great treasure—as doubtless I had heard —on board: fifty thousand pounds in gold, consigned to ——.'

Very wretched and sick at heart, I left the man, still dilating upon the wealth and importance of the mercantile firm with which he was officially connected, and went back to the inn. It was almost my first acquaintance with the world outside Hershell Point, and how selfish all folks seemed! I sat down at a table in the huge coffee-room, and rested my head on my hands, thinking how vastly I had underrated the difficulties of the pursuit in which I was engaged. So long as the Hindu had remained in England, I should have felt certain, sooner or later, of laying hands upon him. His colour and speech would have isolated him from others, and left an easy trace. But thus to have placed the seas between us at the outset, was to have escaped me at once. I had not really faced the possibility of such a thing, and the stroke of good-fortune which had befallen him in this unexpected manner fairly paralysed me. It had been all very well to vow to follow him to the ends of the earth, but how was I to find him in the wide waste of India?

'You seem sad, Mr Marmaduke Drake,' said a quiet voice close to my ear. It was a bantering

Digitized by Google

voice, and I was not in the humour for banter. I looked up angrily, and perceived that a stranger had seated himself at the next table—a stout hale man, who had apparently taken a great deal of port wine in his time, and was taking some now with his luncheon. He was dressed neatly in black, with a white tie, and yet he did not look like a clergyman.

'Sir,' said I coldly, 'I have not the pleasure of your acquaintance.'

'Yes, you have,' replied he carelessly. 'You have had more—I have done business for you, and never charged you for it—a most unprofessional proceeding. My name's Geoffrey Moulden.'

I rose up at once and warmly shook his hand. 'Excuse my ill manners, sir,' said I. 'I know no one to whom it more behoves me to be courteous. But of course I did not know you. How came you to know me?'

'The landlady told me who you were. I am going down to spend a day or two with Mrs Blunt at Sandiford; and when I was ordering my trap, she said there was a young gentleman here from those parts. You seem in trouble again, my friend. You have had no more business transactions with Mr Percival Swete, I trust?'

'No, indeed, sir. I am amateur thief-catching just now, and my man has just escaped;' and I told him how the Hindu had carried off the money the previous night, and was now safe on board the *Star of the West*.'

'Well, fifty pounds are not worth taking a voyage to India for,' observed Mr Moulden. 'There is nothing for it but to go home again. Can I not take you some miles in my conveyance?'

I hesitated, unwilling to return home so soon with nothing accomplished. Yet, what could I do? The gig had already gone back, and Mr Moulden's offer was not reasonably to be refused.

'Come, Mr Drake,' urged he cheerfully; 'it would really be a kindness to me, for besides the advantage of your company, the more ballast we have the better, for this wind seems strong enough to put anything on four wheels topsy-turvy.'

The wind had indeed risen, till it was well-nigh a hurricane. Even where we were, in comparative shelter, its effects were visible enough: the leafless trees swayed and bent; and the snow, which had fallen lightly days ago, but, thanks to the frost, still lay about here and there, was carried up into the keen blue air, and once more cast upon the clean-swept earth. But as we left the low-lying land, and climbed the downs, the blasts were terrific. Fortunately, they came from behind, for otherwise we could not possibly have held on our way. Conversation, although we were in a closed fly, was rendered impossible, and I was not sorry for it, for I had not heart for the blithe old lawyer's cheery talk, but was plunged in my own sad reflections.

Suddenly, however, an ejaculation from my companion made itself heard, and he hastily pushed down the window. 'Look, look!' cried he excitedly. 'Great Heavens, what a sight!'

We had by this time reached the summit of the downs, only a mile or two above the Point, and the vast stretch of ocean lay in view for the first time. To a landsman's eyes, the spectacle must in truth have been majestic; and even to mine, well accustomed to the ocean in her fits of fury, it was wondrous grand. The whole sea was sheeted with foam, while Hershell Bay, generally smooth, except in very rough weather, boiled like a caldron. On the north-eastern side, where the reef lay, the spray spouted up in floods, and the short winter day was fast closing in.

'What a night awaits folks at sea,' exclaimed the kindly lawyer. 'It seems as though no ship could live in such a whirlpool.'

The fly-man had stopped, either thinking that my companion's ejaculation had been addressed to himself, or arrested by the spectacle before him, which was indeed unparallelled even on that coast.

'There *is* a ship, gentlemen,' cried he, for an instant leaving hold of his hat to point seaward with his whip. 'Poor souls!'

'I see no sail, Mr Drake,' exclaimed the lawyer impatiently. 'You have younger eyes, can you see any?'

'No sail could stand for a second in this tempest, Mr Moulden,' answered I; 'it would be blown to ribbons: the vessel will be scudding under bare poles. Yes, there she is; and—God help them—she is going straight on the reef.'

'Can we not warn them—can we make no signal?' inquired my companion, who had now got out of the conveyance, and was standing with myself and the driver under the lee of it, as it were. 'Can *nothing* be done?'

'Nothing,' said I solemnly, for had I not seen a dozen noble ships in a similar strait, although never perhaps in one so desperate. 'They know their danger better than we do. Look! she drifts no longer; they have thrown their anchors out.'

'Then she is saved,' exclaimed the lawyer. 'I would give a thousand pounds to see her saved.'

'If her anchors hold,' observed I gloomily; 'but they will not hold; I know that ground so well.'

'They are dragging already, sir,' said the fly-man, who was making a telescope of his hands. And, indeed, we could see her sensibly drawing nearer and nearer to her doom.

'Let us get on towards the sea,' cried Mr Moulden. 'I cannot go to Sandiford while this is taking place. I will go with you, Mr Drake.'

'Alas, sir,' said I, 'my house cannot now receive a guest, or I should say welcome. But we can get down to the beach, of course, if that is your wish.'

So the fly-man drove to the first zigzag, where we left him and the horses in comparative shelter from the fury of the wind, and hurried down to the shore. This was already lined with Hershell men, and among them Mr Glendell, who had a telescope. He was too humane a man to think of anything save the peril of the poor souls before his eyes, and he only grasped my hand without questioning me.

'Is there no hope?' said I.

'No, none,' answered he, 'as you may see;' and he handed me his glass.

The vessel, which was a very large one, was now within a few feet only of the reef. Upon its decks, the few sailors who had not been swept off by the huge seas were engaged in cutting away the masts, of which there were three, and the rigging. The ship soon tumbled about a mere hull in the trough or on the summit of the waves.

I offered the telescope to the lawyer, but his hands trembled so excessively that he could see nothing through it. 'I am glad I don't live here,' said he with agitation, 'to see such sights as this!'

The men about us were looking on gravely enough, but without any passionate excitement.

Digitized by Google

'I never knew a storm like this,' answered Mr Glendell; 'nor the wreck of so great a vessel. She must have a great many souls on board. I fear we only see a few; the rest are below.'

'Where is Rosa?' inquired I.

'Getting all things ready, in case we can be of any help; but they will not be needed. Nothing with life could come ashore in such a sea as this.'

'There she goes, stern foremost,' cried a man beside us.

'What! gone down?' exclaimed the lawyer. 'Surely I see her yet.'

'No, sir; gone on the reef.'

'I'll give a hundred pounds,' cried Mr Moulden, 'to the man who takes a rope out to that ship.'

'No man without wings could do it, sir,' returned the fisherman quietly. We were standing under the cliff in comparative shelter, and could converse easily enough, because the wind was blowing from off the land. 'It is now only a question of a few minutes. When her cable parted, her last hope was gone. See, she is coming broadside on! And now she is gone!' And yonder, true enough, there was now no object to be seen save the wild waves, leaping and roaring, as though exulting over their captured prey.

'It is all over,' said Mr Glendell reverently. 'God help them!'

'What! must they all drown?'

'Ay, all, sir,' said the fisherman. 'By to-morrow morn, there will be plenty come ashore, most like; but they will be Dead Men.'

'It was a fine ship, too.'

'Do you know what ship it was?' asked I, with a selfish heart-throb.

'Yes; I know her well; she was an Indiaman—the *Star of the West*. She came round from Daisyport only this very morning.'

CHAPTER XVI.—LEFT ALONE.

What a day had I just passed! What an eight-and-forty hours of sleepless anxiety, and bitter loss, and then of loss again, though of another sort, and again of vain pursuit, ending in that tragedy of shipwreck. And now that Mr Moulden had gone on his way to Sandiford, and I was to return to my desolate home with what it held, the thing that was no more my dear, kind, noble Uncle Theo, a cold shudder crossed over me. Mr Glendell said: 'You must come with me to-night, Marmy, else you will want nursing.' I knew that he spoke the truth. This sudden change from the quiet uneventful life in which every day repeated itself, had been too much for me. Until I had taken some food, the doctor would not allow me to enter upon the subject of my late expedition, and even then he was against it; only Rosa, who was a wiser physician than himself where the mind was concerned, contended, as I afterwards found out, that it was better for me to say my say.

'Well,' said the doctor, musing, when I had finished my story, 'it is so far satisfactory that the matter is over: there is no more suspense to be endured. The Hindu, poor devil, has escaped us, and there's an end. So now, early as it is, go to bed, Marmy; and if you can sleep four-and-twenty hours, so much the better.'

I did as I was bid—it seemed so pleasant to me to be directed—to be no longer dependent on myself alone; and, although my rest was troubled with hideous dreams, I did sleep until after daybreak. Then I arose, and finding that my host had already gone down to the beach, I followed him. The shore was strewn with spars and timbers; but the sea, after its day of fury, had sunk to almost a dead calm; in the still blue air, one could hear the voices of the men who thronged the shore, in almost as great numbers as the previous night, for a great distance: some were in boats at the end of the reef, above the very place where the great ship had gone down; but most of them were looking for what had been cast ashore, as usual.

'He would be a good haul,' said one to another; 'and a deal more worth having, if we could find him, than ever he was when alive.'

'You may say that,' answered the other. 'His Master was a very different sort—God bless him. But how strange it was that they two should have gone and died within twelve hours of one another, eh!'

'Ay, strange indeed.'

Of whom could they be talking, unless of my uncle and his servant? I listened eagerly, but they said no more until I came up with them.

'Have many bodies come on shore?' inquired I.

'No, Mr Marmaduke; half-a-dozen poor sailors; and that's all. The passengers, you see, were under hatches; and they say out yonder that the ship has settled down quite upright, and did not break amidships, as we thought certain. I doubt whether we shall find him as you're looking for, at all.'

'Him that I am looking for?'

'Yes, sir; the poor black fellow as was Mr Braydon's man. Mr Glendell told us as you wished to have him buried right and proper, and has offered ten pounds to whoever finds him.'

I nodded, but did not speak.

It was clear that Mr Glendell did not consider the matter wholly ended, as he had endeavoured to convince me. There was still a chance of finding the Hindu's body, and with it the secret. At this idea I seemed to feel new life. Action, at all events for the nonce, lay now before me, not merely barren regret and choking grief. Had not my uncle enjoined on me to recover Sangaree Tannajee *dead or alive!*

Presently, I saw Mr Glendell searching with the rest, and began to thank him for his forethought in the matter. 'It would indeed be a comfort to me,' said I, 'if the corpse should be found; and besides, although you would not have known it, the packet was wrapped in sealskin, so that the salt water will not hurt what it contains.'

'That's well,' returned the doctor; but by no means with the satisfaction I had expected from him, since he had been of late so eager about the secret. 'We can but do our best; in a few hours the thing must be decided one way or the other.'

'Why in so short a time?' inquired I, for I knew that bodies would often come ashore for many days, and even weeks, after such shipwrecks.

'Well, this is a curious case, Marmy; the vessel has gone down at the very extremity of the reef, and almost outside it, so that when she breaks up, all she contains may go hither and thither, and not necessarily come into the bay.'

'And if what we look for did come,' said I, unable to repress a shudder, 'it would, I suppose, after a very few days, be totally unrecognisable, no matter how great was the diversity from its fellows while in life?'

'Why, yes; you know yourself what difficulties

Digitized by Google

there have been here in the matter of identification. Two mothers claiming the same body as that of their drowned son, and so forth,' observed the doctor coolly. 'The features of the dead, in this country at least, are not generally recognisable after eight-and-forty hours. I remember, in the hospital in which I learned my trade, there was a leather body which was sworn to once or twice by enthusiastic witnesses. There is nothing which more requires, and less often receives, a cool judgment than the identification of the dead. But I am speaking, of course, of bodies which have been exposed to atmospheric influences; the sea is a great antiseptic, and as long as the subject is kept under water'——

The doctor, diffuse only upon professional subjects, would doubtless have extended his lecture considerably, but that at this moment a number of fishermen began to run together towards one part of the beach, and we could see some huge object floating towards them.

'Good Heavens! it is some poor woman,' ejaculated the doctor.

Then a great shout of laughter broke from the men: it jarred discordantly enough, as may well be supposed, upon such a scene, and I felt hot with shame and anger.

'The brutal scoundrels!' said the little doctor fiercely; and off we both ran to the spot in question. We could scarcely believe our ears when we heard, as we drew near, the shouts of mirth repeated; for Hershell folks, although used enough to such spectacles, were never callous, and far less ruffianly. Their own perils in the deep made them pitiful for the victims of the sea.

'What is it, men? Are you mad?' cried I, who had outstripped my companion.

'Lor bless ye, Mr Marmaduke; only look at this. We thought it was some drowned fellow-creature, and it 's only the blessed figure-head.'

And indeed there was the huge female figure which had adorned the prow of the sunk ship, comparatively uninjured—for the Indiaman had struck, as I said, stern foremost—with *Star of the West* carved beneath it in large gold letters.

'How Tragedy and Comedy go hand in hand together through the world,' mused I.

'True,' said the doctor: 'the very observation, while speaking of Tannajee and your poor uncle, Mrs Blunt made last night.'

'What!' exclaimed I, surprised, 'did you see her last night?'

The doctor looked confused. 'Yes,' said he. 'I thought it right to ride over to Sandiford, when you had gone to bed, to tell her what had happened to Mr Braydon, and about the wreck.'

'That was very good of you,' said I; 'you think of everything for me; although, indeed, I suppose it was Rosa who thought of that?'

'No; it was entirely my own idea,' answered Mr Glendell carelessly.—'Well, we can do no good here that these fellows cannot do for us; let us go in to breakfast.'

My thoughts were too much occupied with weightier matters to dwell upon it at that time, but even then, it seemed to me a very strange thing that the doctor, who loved his ease, should, on such a stormy night, have gone to tell Mrs Blunt what she must needs already have heard hours before from the lips of Mr Moulden.

All that day, and the next, I watched the sea with keener expectation than any wrecker; but the dreadful gift for which I looked with such weird longing it refused to give, and we were told that now it would never come. On the third day, Mr Glendell had a long and serious talk with me. 'You are very far from well, Marmy,' said he; 'you do not eat, nor, as I fear, sleep. Is it not so?'

'I do not sleep much,' said I; 'but I am well and strong.'

'That is impossible, my friend: the state of excitement in which you at present subsist seems to you to be strength, but it is in reality wearing out your stamina, and when it leaves you, there will be danger.' He felt my pulse, looked graver still, and shook his head. 'When the wave of life flows as yours does, Marmy, it strands a man almost like those poor fellows on the beach yonder. I fear low fever for you at the best. You must have quiet; you must indeed.'

I felt he spoke the truth, for though I was not sensible of fatigue, I knew no rest, to be called such. I loathed my food, and every morsel went nigh to choke me; my veins seemed to flow not with blood, but fire; but I also felt that the remedy which he proposed was utterly beyond my reach. Quiet! My brain was filled with thoughts that pressed so close upon each other's heels, that there was not a moment's space between them; yet not with thoughts, but rather with visions, dreams, and ghastly chimeras. I could not think, in the ordinary sense, at all; I could not have written a sentence of my usual literary work, for instance, if it had been to save my own life, or recall that of my beloved Uncle Theo. Even Rosa had no power to soothe me.

'I cannot but reproach myself,' said Mr Glendell, 'for my own part in this matter; if I had not been so eager to help you to get back this wretched Hindu, you would have been less anxious to do so, and by this time have put up with the loss. But now you are consumed with a vain longing for a secret which is hidden for ever in the depths of the sea.'

I did not attempt to gainsay this. How could I, whom the first dawn of morning and the last faint flush of sunset had found watching by the calm and mocking deep, and to whom all night there appeared hideous shapes, all with some fantastic likeness to the form he spoke of, and each with a finger at its lips! If ever there was a haunted wretch, it was I.

'Now, look you, Marmy,' continued the doctor; 'if you do not wish myself and Rosa—for it was she who finally decided you upon undertaking this idle search, and she regrets it as bitterly as I do—to have your illness on our consciences, you will do your best to face this matter like a man. While there was hope, I clung to it as closely as did you. I confess that I was bitten with the mystery that hung about that wretched creature, and would have given much, especially of late, to solve it. But now that there is no hope, I bow to Fate's decree. It is foolish, it is wicked to oppose one's-self to that. From henceforth, I think no more of Sangaree Tannajee and the secret, which is buried with him for ever. I will not speak of him more, nor suffer others beneath my roof to do so; and to-morrow, when we have laid your dear good uncle in his grave, I leave this place, to spend a month in town, whither business calls me, and I shall take you with me.'

Then ensued the nearest approach to a quarrel

Digitized by Google

that ever took place between myself and good Mr Glendell. I felt the force of his reasoning, and I gave him every credit for his excellent intention, but I knew better than he did the disease that was in my own mind, and how powerless would be his remedy to cure it. Nay, I was well convinced that to tear myself away from Hershell just now would only be to aggravate my symptoms. It was at the doctor's house, which was inland, that, notwithstanding Rosa's presence there, I always felt worse; whereas by the shore, and with my eyes fixed on the deep, that had robbed me of my secret, and held it in its bosom, I was more tranquil. I cannot explain my condition; but I have heard that some folks whose hopes are centered in a Chancery suit, are, however frail their chance of gaining it, for ever haunting Lincoln's Inn, as though the very locality where the trial is pending soothes their anxiety, notwithstanding that they only hear bad news there; and so perhaps it was with myself—a baffled suitor of the unjust sea. At all events, I was firmly determined, while the timbers of the *Star of the West* yet held together beyond the reef yonder, beneath that treacherous dimple of the smiling deep—for both days and nights were now summer-like in their calm—to remain at Hershell, notwithstanding I was informed on all hands that when the ship did break up, it was certain, from her situation, that should any bodies be still in her, they would drift seaward, and never come to shore.

I was therefore adamant to all the doctor's appeals, though, when persuasion failed, he did not hesitate to use sharpness. To Rosa (as I afterwards learned) he even said: 'Unless we take him with us, when we come back we shall have to tend a madman;' whereby of course he secured her most earnest co-operation in his efforts. But all failed. At home I was resolved for the present to stay. And after we had reverently laid dear Uncle Theo in his last resting-place, Mr Glendell and Rosa started for town, leaving me alone at the Point, to which I had now returned. How little I guessed what a change was to take place in me, and in life's prospects, before I beheld them again!

EPITAPHS.

As numberless as stars in the heavens are graves on the face of the earth. Reader, do you care to wander through country churchyards, where sheep are nibbling the long grass and wild-flowers, and blithe birds singing in old trees, whose rough bark and branching splendour have been the growth of centuries—where peace, and quiet, and everlasting stillness seem fitting for the repose of the sons of Adam, when their spirits have journeyed from this troubled world for ever?

Do you care to wander through ancient burial-yards in the midst of noisy cities, where living, waking, busy man is constantly passing by the dust of his brother man—where life, in its very essence of activity, seems strangely at variance with the mound that covers him who is 'a dead man out of mind?' And again, do you care to wander through beautiful new cemeteries, where elegant monuments, carefully tended flowers, and fresh young trees may take away from the solemnity of the old churchyard, but give bright and pleasant feelings about the grave? Do you like to read the records of the dead, the lamentations of the living, and the curious ideas and verses that one finds inscribed on stone and engraven on granite?

If so, perhaps on some snowy or rainy day, when the 'ingle nook' is preferable to the regions outside, the following collection of epitaphs may while away some spare half-hour.

Epitaphs are what?—The thoughts of the living (and sometimes those of the dead) expressed in words, and engraved in memory of those who are gone before. Very often they are texts from the Holy Scriptures. Affection, mingled with Hope, speaks forth in these terms: 'I shall go to him, but he will not return to me;' or in praise of the good life and blessedness of the death of the departed, as, 'Blessed are the dead that die in the Lord,' and such-like texts. Resignation exclaims: 'Thy will be done;' and Faith: 'I know that my Redeemer liveth.' Again, we find quotations from the poetical version of the Psalms, and verses of poetry of different kinds, recording, generally, the brevity of life. In the cemetery at Tunbridge Wells, we see the following:

Our life hangs by a single thread;
Soon 'tis cut, and we are dead.
Then boast not, reader, of thy might;
Alive at noon, and dead at night.

Also, in the same cemetery, on a girl aged sixteen:

Behold this flower, so young and fair,
Called hence by early doom,
Come forth to shew how sweet a flower
In Paradise might bloom.

An epitaph of a much higher character claims our notice on an old stone in a desolate little kirk-yard at Roslin—the same is also to be found at Haddington:

Underneath this stone doth lie
As much beauty as could die,
Which, while it lived, did vigour give
To as much virtue as could live.

At Melrose Abbey is another of the same kind:

Earth walketh on the Earth,
Glistening like gold;
Earth goeth to the Earth
Sooner than it wold;
Earth buildeth on the Earth
Palaces and towers;
Earth sayeth to the Earth,
'All shall be ours.'

A beautiful inscription is this on the tombstone of Sir John Grahame, in Falkirk Churchyard:

Heir lyes Sir John the Grahame, baith wight and wise. Ane of the chief reskewit Scotland thrise. Ane Better Knight not to the world was lent—nor was guide Grahame of Truth and Hardiment. Sir John was slain by the Engl. 22d July, 1298.

In Glasgow Cathedral is an epitaph, which is engraved on the lid of a very old sarcophagus, discovered in the crypt:

Our Life 's a flying Shadow, God 's the Pole,
The Index pointing at him is our Soul,
Death 's the Horizon, when our Sun is set,
Which will through Chryst a Resurrection get.

On a stone in the churchyard at Langtown, in Cumberland, we read:

Life 's like an inn where travellers stay;
Some only breakfast and away;
Others to dinner stay, and are full fed;
The oldest only sup and go to bed;
Long is his bill who lingers out the day;
Who goes the soonest has the least to pay.

Digitized by Google

To go farther afield. Come to Russia, and amidst the thousands who fell in the roar of the battle, and found a grave in that far-distant country: the *Times* says: 'At the Malakhoff there is nothing but a large wooden cross at the head of a mound full of dead, with this inscription in white paint:

Unis pour la victoire,
Réuni par la mort,
Du soldat c'est la gloire,
Du brave c'est le sort.'

In a secluded ravine, among many other tombs, we find this quaint inscription:

I am anchored here below, with many of the fleet,
But once again we will set sail our Admiral Christ to meet.

Here and there, the melancholy yew-tree and fading rosebud speak for themselves of the weary and of the young who repose beneath the dust of the earth, without other record than the silent thought that occurs to the mind of the passer-by, that 'all flesh is grass, and the glory thereof is as the flower of the field;' but here and there also, rude country wit makes sad havoc with solemn thoughts, and causes a smile, however unwillingly, to rise. For instance, in the churchyard at Nettlebed, Oxfordshire, we have what follows:

Here lies father and mother, and sister and I;
We all died within the short space of one short year.
They all be buried at Wimble, except I,
And I be buried here.

Here is one which apparently included the living as well as the dead:

John Palfreman lies buried here,
Aged 4 and 20 year;
Near this place his mother lies;
Likewise his father when he dies.

Surely the following must be of Hibernian origin:

Here lies the body of Nicholas Round,
Who was lost in the sea, and never was found.

The next inscription which I have noted down is to the memory of a wife:

Here lies my wife, a sad slattern and shrew;
If I said I regretted her, I should lie too.

At Ocknam, Surrey:

The Lord saw good, I was lopping off wood,
And down fell from the tree;
I met with a check, and I broke my neck,
And so Death lopped off me.

At Cookham we find,

An honest man's the noblest work of God.
Here lies an honest woman.

A very impolite one exists in Sunbury Churchyard:

Here lies my beast of a first wife.

In striking contrast we find in Ross Churchyard:

Behold an angel dwelt among men.

At Lincoln:

My sledge and hammer lie reclined,
My bellows too have lost their wind,
My fire's extinguished, forge decayed,
And in the dust my vice is laid.
My coal is spent, my iron gone,
My last nail *driven*, my work is done.
Finis coronat opus.

Walking through the old churchyard at Carisbrooke, Isle of Wight, I came upon the following:

This world's a city full of streets,
And Death's the market-place where all men meet.
If Death were merchandise that gold could buy,
The rich would live, the poor alone would die.

Here is a great mistake! To make sense, it should be, 'If *life* were merchandise,' &c.

On the south wall of Streathem Church is this singular inscription:

Elizabeth, wife of Major-general Hamilton, who was married 47 years, and never did *one* thing to disoblige her husband.

The following is on a tombstone in San Viego, California:

This year is saked to the memory of William Henry Shraken, who cam to his deth being shot with Colt's revolvers—one of the old kind, brass mounted, and of such is the Kingdom of Heaven.

A curious play upon words is this epitaph on Barraud, the watchmaker, late of Cornhill, London:

My *main-spring broke*—no further use the *key*
That served to *set me going;* my *Hour* is come,
And I who made—to *measure Time*—full oft with glee,
Have fall'n beneath th' unerring *hand*—'tis done.

Encas'd within this marble Tomb—I wait
The *action* of th' Almighty *regulator*—my *works if good*
Will meet reward—and tho' 'tis now too late
To *mend*, I hope redemption thro' my Saviour's blood.

The next is perhaps more widely known, but so singularly unflattering, that I cannot refrain quoting it. It is an epitaph on Mr William Wright:

Here lies the body of W. W.,
Who never more will trouble you, trouble you.

The following epitaphs, many of them quaint and comical in the extreme, I believe to be authentic, but (with one exception) I know not in what quiet grass-grown nooks they have their habitation. Whilst in life, we often have a desire to choose the spot where our mortal remains shall rest; when death comes, our friends, guided by various reasons, choose that last home for us. In the following epitaph, we see a strange contentment with this choice, supposed to be the utterance of the dead himself:

Here lie I at the Chancel door;
Here lie I because I'm poor.
The further in, the more they pay;
But here I lie as warm as they.

The next is on a Miss Partridge, who died in the month of May:

What! shoot a partridge in the month of May!
Was that done like a sportsman—eh! Death, eh?

Our interest is now awakened by an extraordinary assertion:

Here lies
Elizabeth Wise,
She died of thunder sent from heaven,
In 1777.

I withhold all comment on the next:

Oh! do not weep, my husband dear;
I am not dead, but sleeping here;
Then mend your ways, prepare to die,
For you are soon to come to I.

Digitized by Google

Written under in pencil was this:

I do not weep, my dearest life,
For I have got another wife;
Therefore, I cannot come to thee,
For I must go to cheriah she.

In the following, also, the widower seems to rejoice in his loss:

This dear little spot is the joy of my life,
It raises my flowers, and covers my wife.

The annexed epitaph is on a young woman who gained her livelihood by selling eggs, and from the tenor of it, we judge her brother must have erected the stone to her memory:

Here lies the body of Mary M'Groyn,
Who was so very pure within,
She broke the outward shell of sin,
And hatched herself a cherubim.
N.B.—Her brother, made of sterner stuff,
Adds to her business that of snuff.

On a tombstone in a churchyard near Cheltenham, we find a strong and unvarnished opinion in the mineral-water line:

Here lies I, and my three daughters;
So much for drinking the Cheltenham waters.
If we had kept to the Epsom salts,
We never would have lain in these 'ere vaults.

The next calls forth our sympathies, there is such a ring of sorrow, such deep pathos in the few words so curtly spoken:

Poorly lived,
Poorly died,
Poorly buried,
And no one cried.

On a photographer, we read:

Here I lie taken from life.

He was hard up for a rhyme who penned this to the memory of a neighbour:

Here lies W. A.,
Lately removed from over the way.

The next is highly complimentary to a father's feelings:

Here lies the mother of children 5,
Three are dead and Two are alive;
Those who are dead preferring rather
To die with their mother, than live with Father.

I conclude with a sonnet (Does that mean an epitaph in this case?) on a youth who died from excess of fruit-pie, and also with a species of puzzle I copied from a tomb at Monmouth Churchyard. To begin with the sonnet:

Currants have check'd the *current* of my blood,
And *berries* brought me to be *buried* here;
Pears have *par'd* off my body's hardihood,
And *plums* and *plumbers spare* not one so *spare*.
Fain would I *feign* my fall; so *fair* a *fare*
Lessens not hate, yet 'tis a *lesson* good.
Gilt will not long hide *guilt*, such thin washed *ware*
Wears quickly, and its *rude* touch soon is *rued*.
Grave on my *grave* some sentence *grave* and terse,
That *lies* not as it *lies* upon my clay,
But in a gentle *strain* of *unstrained* verse,
Prays all to pity a poor patty's *prey*,
Rehearses I was fruitful to my *hearse*,
Tells that my days are *told*, and soon I'm *toll'd* away!

Last of all, this Monmouth one, made by the man himself when dying:

e	i	n	e	R	n	h	o	J	s	J	o	h	n	R	e	n	i	e
i	n	e	R	n	h	o	J	s	e	s	J	o	h	n	R	e	n	i
n	e	R	n	h	o	J	s	e	i	e	s	J	o	h	n	R	e	n
e	R	n	h	o	J	s	e	i	l	i	e	s	J	o	h	n	R	e
R	n	h	o	J	s	e	i	l	e	l	i	e	s	J	o	h	n	R
n	h	o	J	s	e	i	l	e	r	e	l	i	e	s	J	o	h	n
h	o	J	s	e	i	l	e	r	e	r	e	l	i	e	s	J	o	h
o	J	s	e	i	l	e	r	e	H	e	r	e	l	i	e	s	J	o
h	o	J	s	e	i	l	e	r	e	r	e	l	i	e	s	J	o	h
n	h	o	J	s	e	i	l	e	r	e	l	i	e	s	J	o	h	n
R	n	h	o	J	s	e	i	l	e	l	i	e	s	J	o	h	n	R
e	R	n	h	o	J	s	e	i	l	i	e	s	J	o	h	n	R	e
n	e	R	n	h	o	J	s	e	i	e	s	J	o	h	n	R	e	n
i	n	e	R	n	h	o	J	s	e	s	J	o	h	n	R	e	n	i
e	i	n	e	R	n	h	o	J	s	J	o	h	n	R	e	n	i	e

The capital H in the centre is the clue; in fact, it simply reads, in ups and downs, &c., 'Here lies John Renie.'

'FRIENDS' IN NEED.

In these days of religious freedom, wherein even Spain has announced toleration for all creeds, and when in our own country such mild measures as 'inhibition' from this or that practice is held to be Persecution, while those at whom it is aimed constitute themselves as Martyrs accordingly, it is quite refreshing to come across a genuine denominational grievance. One may think it hard that as a priest he may not dress in green and gold, and another may complain that all liberty of conscience is at an end since his incense-pot has been denounced by the Privy Council; but we have not come to the Inquisition yet, nor is it likely that we shall do so. Laymen, indeed, are permitted any theological eccentricity, so long as they do not obstruct the public thoroughfares, by missionary enterprise; and to hang up a Quaker gentleman by the thumbs (unless it was Mr Bright, which would undoubtedly give pleasure to some people), because he sticks to his own doctrinal views, would certainly be held in England a strong measure. And yet under the shadow of the wings of that much vaunted bird of freedom, the American eagle, this (and a great deal worse) has, it seems, of late been done.

The record of it now lies before us in *A Narrative of the Cruelties inflicted upon Friends during the Years* 1861 *to* 1865, *in consequence of their Faithfulness to the Christian View of the Unlawfulness of War;* and a very remarkable narrative it is. 'The statements,' says its preface, 'may be accepted as literally true, taken down in most instances from the lips of the sufferers themselves;' and the pamphlet itself is issued by direction and on behalf of the representatives of the North Carolina yearly meeting of Friends, in July 1868.

Digitized by Google

At the breaking out of the civil war in America, if the Quakers were unpopular with the North as being non-combatants, they were doubly odious in the South, on account of their hostility to slavery. Upon that subject, they were far in advance of their southern fellow-countrymen. In 1740, this same North Carolina Meeting contented itself with pronouncing an 'advice' that all slaves be 'well used;' but thirty years later, it declared the importation of negroes from Africa to be 'iniquitous;' and in 1776, the practice of slaveholding was formally condemned. For more than thirty years after, there were 'Friends' who were not fully convinced of this evil, or were so involved in it as to make their extrication difficult; but in 1818, slaveholding was abolished in the Society, and the brief record of the yearly meeting ran thus: 'None held as Slaves.'

To begin with, therefore, the Friends had placed themselves in antagonism with the people of the Southern States, and, when hostilities commenced, the ill-feeling towards them took a practical shape, and increased with the duration of the contest. By the passage of the Conscription Act in the Confederate Congress in 1862, every man between eighteen and thirty-five years of age was required to enter the army; in 1863, it was made to include all between eighteen and forty-five; and in 1864, all between seventeen and fifty. The Friends petitioned Congress for relief; and, in the first instance, obtained exemption on the payment of one hundred dollars each, which tax, however, was raised a few months later to five hundred dollars. As the war proceeded, and the necessities of the Southerners increased, the Quakers were more and more severely treated. Rude arrests, short but uncertain imprisonments, and violent menaces, were at first the lot of those who were drafted and refused to fight. Some escaped to the West; others 'felt at liberty' to engage in the state saltworks, 'though not a few of the latter, finding their work too closely connected with war' [probably the making of gunpowder], 'relinquished it.' Then the Southern gentry began to use sharpness, and to hang up Quakers by the thumbs. Here is one instance out of many. 'In the spring of 1865 about forty men, professing to be in search of conscripts, came to a mill belonging to J. D., of Cane Creek, Chatham Co. The miller was first hung up by a rope three times, to force him to betray his sons, who were hidden. Upon hearing the screams of the miller's wife and children, J. D. went out to the crowd. The same information was demanded of him, but he assured them of his entire ignorance as to their retreat. He was at once seized and carried into the barn. A rope was tied around his neck, and thrown over a beam, while he was mounted upon a box. Then, beginning to tighten the rope, they said: "You are a Quaker, and your people, by refusing to fight, and keeping so many out of the army, have caused the defeat of the South;" adding, that if he had any prayers to offer, he must be quick, as he had only five minutes to live. J. D. only replied that he was innocent, and could adopt the language, "Father, forgive them; they know not what they do." They then said they would not hang him just then, but proceeded to rob him; then ordered him under a horse-trough, threatening to shoot him if he looked up. While lying there he could hear them hanging up the miller three different times, till the sound of strangling began. After finally extorting a promise from him to find his sons, they left, charging J. D. to lie still till they came back with some others to hang. They did not return, however, but went on to one of his Methodist neighbours, whom they hung until unconscious, and then left him in that state; and the next night they found one of the missing conscripts, whom they hung until dead.'

This was not a mere ebullition of anger on the part of a pressgang. The officers of the Southern army were instructed to carry out these persecutions; at all events, they did so. On their refusal to take a gun, the unfortunate Friends were subjected by the military authorities to something very like torture. Not only were guns tied to the arms of these non-combatants, and straps round their necks, by which they were dragged about, but they were married to a sort of Scavenger's Daughter. 'S. F.,' for instance, 'was subjected for two hours to the brutal punishment known as Bucking, in which the person is placed in a stooping position, the wrists firmly tied and brought in front of the knees, with a pole thrust between the elbows and the knees, thus keeping the body in a painful and totally helpless position. After this, he was made to carry a pole for two or three hours, and then tied during the night. The next morning, he was tied up by the hands for two hours. The same afternoon, a gun was tied to his right arm, and a piece of timber to his neck. Unable longer to endure the weight of it, he sat down, in order to support the end of it upon the ground, when he was pierced by a bayonet. They then bucked him down again, and gagged him with a bayonet for the remainder of the day. Enraged at the meekness with which these cruelties and indignities were borne, the captain began to swear at him, telling him it was useless to contend further; he must now take a gun or die. As the captain proceeded to tie the gun upon his arm, S. F. answered quietly: "If it is thy duty to inflict this punishment upon me, do it cheerfully—don't get angry about it." The captain then left him, saying to his men: "If any of *you* can make him fight, do it—I cannot." Two young men now appeared with their guns, telling him they were going to take him off and shoot him. "It is the Sabbath," he replied, "and as good a day to die as any."' The next day, the Bucking was again resorted to.

There are, in fact, so many examples given of this practice, that Bucking a Quaker seems to have been an amusement as popular with the Southern army as the game called 'fighting-cocks' is with schoolboys. Friend H. M. H. suffered a still more severe punishment. 'At three different times, he was suspended by his thumbs, with his feet barely touching the ground upon the toes, and kept in this excruciating position for nearly two hours each time. They next tried the bayonet: their orders were, they said, to thrust them in four inches deep; but, though much scarred and pierced, it was not so severely done as they had threatened. One of the men, after thus wounding him, came back to entreat his forgiveness.'

If the 'four inches deep' strikes the reader as a little exaggerated in the martyr's recital, this mention of entreating his forgiveness must be set down *per contra*. It seems to us, indeed, that Friend H. M. H. was not only a martyr, but a fanatic, since he declined to make use of such means of relief as Providence placed within his reach, though with what precise object, unless, through

Digitized by Google

extra suffering, to increase the subsequent spiritual penalties of his persecutors, does not appear. His story runs as follows: 'In the spring of 1862, two brothers, H. M. H. and J. D. H., were drafted, arrested, and taken to Raleigh. Being allowed to return home for ten days, they faithfully reappeared. They were soon sent to Weldon, where they were required to drill, and were warned of their liability to be shot if they proved refractory. They were, however, only kept in close custody in the guardhouse, and the next month were discharged, and sent home. About a year after this, they were included in the conscription. They were assigned to an artillery company at Kinston, and after various threats, were sent to Gen. R——, who declared that his orders should be carried out at all hazards. They were now confined in an upper room without food or drink. Various persons were allowed to converse with them, and, as day after day passed on, so far from sinking under the suffering, they used their little remaining strength gladly in explaining their testimony, and telling of their inward consolation. They felt that, in this time of fiery trial, this did indeed turn to them for a testimony, and that they knew the promise fulfilled: "It shall be given you in that same hour what you shall speak." Their sufferings from thirst were the most acute. On the third night, the brothers were wakened from a peaceful sleep by the sound of rain. A little cup had been left in their room, and from the open window they could soon have refreshed themselves. The first thought of each was to do so. They were in nowise bound to concur in this inhuman punishment; *yet an impression was clearly made upon their minds, before consulting each other, that they must withhold*, and they scarcely felt the copious showers tempt them. The next morning, several officers entered the room and questioned them closely: they claimed it to be impossible for them to retain so much strength without any food, and charged them with having secretly obtained it. They then, in much simplicity, told them of their not feeling easy to take even the rain that fell. This evidently touched the hearts of the officers. Soon after the end of four and a half days' abstinence, a little water was allowed, and about the end of five days their rations were furnished again.'

We can easily imagine that the virtue and determination of this excellent pair of brothers must have put the warriors of the Southern army very much out of patience; but nothing can excuse such infamous persecution, and this pamphlet details many other similar cases. The Southern Confederacy was, according to its own account, fighting for Liberty, above all things; Liberty (for white men at least) to act and think as they chose; and nothing can shew more clearly how little they were really actuated by that principle than this treatment of an inoffensive sect. It is curious to see, how, under a stress of circumstances sufficiently strong, the worst practices of the worst ages are thus found to make their reappearance. To suspend a man for two hours by his thumbs, with his toes barely touching the ground, because he will not abjure the religious principles he has always professed, is an act which, to Englishmen at least, seems to put the world's clock back for three centuries. We have no doubt of the general truth of the statements above reported, but must differ altogether from the views of the North Carolina Friends on one point. We cannot think that the severe measures adopted with those who became Quakers after war was declared, is to be spoken of in the same breath with the persecutions inflicted on those who professed the non-combatant faith of their Fathers. The conversion of the former to 'the principles of peace,' was, to say the least of it, most suspicious and inopportune. In many cases, nay, in most, it could only have been another form of 'malingering.' Even if 'the pressure of the Spirit' had been ever so powerful, a man of honour would have hesitated to leave the ranks of his fellow-countrymen in that supreme hour of their peril, to shelter himself under the Exemption Act. The North Carolina Meeting seems to take it for granted that all such converts were sincere; this credulity, and a certain Methodistic twang in the style of its narrations, are the only drawbacks to this singular pamphlet, which certainly discloses cruel wrongs, and illustrates anew how human nature repeats itself, under pressure, in acts which one might have hoped no civilised country would witness more.

MY BABY'S LULLABY.

Oh, hush! little baby! Hush, hush! lullaby!
Thine eyes should be closing, and silent thy cry;
My babe, softly couched on thy mother's warm breast,
All past is thy toying—'tis time thou shouldst rest.
Cease, pretty fingers, to stray in my hair;
Peace, joyful murmur, enriching the air;
Droop, brightsome eyes—seek thy mother no more;
Smiles durst not come, though thy mother bends o'er:
At morn, to thy touch, 'tis her joy to reply;
She shuns thee but now, sweet! Hush, hush! lullaby!

Oh, hush! pretty baby! Hush, hush! lullaby!
Thine eye is not hidden; still lingers thy cry
My babe, though thy babble is life to my breast,
I sing thee to sleep, love, I lull thee to rest.
Part not thy lips; my glad kiss I must keep;
I may not caress till I see thee asleep.
Slumber, my babe; the gay sunlight is past;
Flow'rets so tender in sleep should be fast.
I heed not thy prattle, I turn from thy cry;
Sleep, sleep, baby darling! Hush, hush! lullaby!

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 270. SATURDAY, FEBRUARY 27, 1869. PRICE 1½d.

THE ROYAL MARINES.

SOLDIERS were habitually employed in ships long before the Marines, as we know them, were called into existence. At first, the Foot-guards supplied the required men. In 1664, in the time of the Merry Monarch, the first 'maritime regiment' was raised, and was numbered, it is supposed, third on the list, or just before the 'Buffs,' which were at first No. 4. The regiment was created 'upon Report of the Lords Commissioners for the Affayres of His Majestye's Navy Royall and Admiralty of this kingdom.' It was, moreover, twelve hundred strong, and 'under one collonell.' A regiment expressly designed for sea-service is mentioned in the Army List of 1684; and in the description of a review at Putney, in that year, the corps is alluded to thus: 'The Lord High Admiral of England, His Royal Highness the Duke of York and Albany's Maritime Regiment of Foot, commanded by Sir Charles Littleton, called also the "Admiral Regiment."' It consisted of twelve companies. It had yellow coats, lined with red; and amongst other appointments, Samuel Tatham and John Tatham were respectively 'chirugeon' and 'chirugeon's mate.' Between the years 1687 and 1698, several more 'maritime regiments' were added, and included in the navy estimates. About this time, too, the men of these corps were retained continuously in them, whereas, before that, they were drafted into the navy, as sailors, as soon as they had learned how to work a ship, their places being filled up by recruits. These troops are spoken of as 'Marines' for the first time on the occasion of the attack on St Christopher, where they were disembarked, and fought on land. On the peace of Ryswick, however, which terminated the hostilities between ourselves and France, Spain, and Holland, in 1697, the Marines were disbanded entirely.

One of the very first acts of Queen Anne, on her accession in 1702, was to establish a powerful force of Marines; twelve regiments were created—six for regular sea-service, and six to act on shore with disciplined land-forces. These troops were soon after employed for the absurd purpose of upholding the pretensions of an Archduke of Austria to the throne of Spain (of which he called himself Charles III.) against Philip V. One very important result, however, followed upon this struggle, for, in 1704, eighteen hundred marines, under the Prince of Hesse, landed at Gibraltar and captured that important fortress, which has never since been out of our possession. The attack was so sudden and dashing on this occasion, that the assailing force penetrated between, and separated the men of the garrison and their women, who were all at their devotions at a chapel some four miles off; and it is supposed that this circumstance had some influence on the governor and other authorities, when they decided to surrender to the summons of the Prince of Hesse. This same force held Gibraltar that year against an attacking force of seven thousand men, until relieved by Sir John Leake. The fortress was then maintained against the Spaniards, until it was ceded to us by the Treaty of Utrecht in 1713. During the wars of this period, the Marines also assisted, besides other services, at the capture of Sardinia, Minorca, and Nova Scotia; and at the Treaty of Utrecht, the two latter remained in our possession.

In the early part of the reign of George I., economy was the order of the day, and great jealousy was entertained towards the maintenance of a standing army. As one effect of these feelings, therefore, and of the Treaty of Utrecht, the Marines were for the second time disbanded, four invalid companies only being retained. This unusual state of affairs lasted, strange to say, for twenty-five years, when, getting pugnacious again, six regiments of Marines were enrolled in the year 1739, receiving their commanding officers and non-commissioned officers from the Foot-guards. Frequent expeditions were now sent out, and notably those for the capture of some of the West India Islands. Marine soldiers were at a premium, and strange as it may now seem, it was actually proposed to 'convert most of our marching regiments into marines.' In 1741, there were no less than ten regiments of marines; but in 1746, curiously enough, they were incorporated with the

Digitized by Google

line, and numbered from the 44th to the 53d regiments inclusive; at the same time, however, they were also called the 1st, 2d, 3d, &c. Marines.

It is well known that the 3d Buffs have the privilege, denied to the rest of the army, of marching through the City of London with colours flying and drums beating. It is not, however, so well known that the Marines have the same privilege. A curious case, proving this, is thus recorded by a Major Donkin. 'It happened in the year 1746 a detachment of Marines were beating along Cheapside, one of the magistrates came up to the officer, requesting him to cease the drum, as no soldiers were allowed to interrupt the civil repose. The captain commanding (an intimate friend of mine) immediately said: "Sir, we are Marines." "Oh, sir," replied the alderman, "I beg pardon; I did not know it. Pray, continue your route as you please."'

In 1747, the Marines were first placed under the Lords of the Admiralty; but in 1748, after nine years of continuous fighting, the peace of Aix-la-Chapelle was concluded, and for the third and last time this celebrated corps was entirely disbanded. On this occasion, many of the disbanded men were sent out to Nova Scotia, as military colonists, by Lord Halifax, and they founded the town called by his name.

It is curious to observe what a kind of war-barometer the corps of Marines has been. In peaceable times, they were either greatly reduced or altogether disbanded; but on the first pressure of war, up they went in numerical strength, as certainly as the column of mercury in fine weather. Thus, in 1755, when a serious struggle with France seemed inevitable, the Marines, from zero, were speedily made up to fifty companies strong. They were divided into three divisions, one of which was stationed at Portsmouth, one at Plymouth, and one at Chatham. They were not again disbanded, although their strength has been subjected to great fluctuations. In 1756–7 commenced the protracted war with France, during which Mr Pitt so nobly upheld the honour of the country, and added so largely to our dependencies at the expense of our enemy. In this year we were threatened with an invasion by France, and in consequence thirty more companies were added to the strength of the Marines. They were then gradually augmented, until, in 1758, they numbered about fifteen thousand men. This, by the way, was the celebrated year when our great constitutional force, the militia, was first raised. War with France or Spain continuing up to 1763, the Marines had been increased up to nineteen thousand men, they had materially assisted in driving the French out of their East Indian settlements, and had helped at the capture of St Lucia, St Vincent, and Grenada. In 1763, however, the war was concluded, and the corps was reduced to seventy companies.

During the war between England and her American provinces from 1775 to 1783, they were gradually augmented in strength until they reached twenty-one thousand; but on the conclusion of peace in the latter year, again they were suddenly reduced to between four thousand and five thousand men. Not very long, however, were they allowed to remain at this strength, for on the outbreak of the great war with France in 1791, their numbers were again raised; and in 1807 they attained their maximum strength of thirty-one thousand. Up to 1802, this body had been called simply 'Marines,' but in this year they were honoured by the appellation 'Royal,' a title which they had fully earned by their brilliant services in the four quarters of the globe. After the peace of 1815, they were reduced to six thousand men; but they have been gradually augmented, until they now number 14,700.

The marines have always been noted for their stanch, steady, and reliable conduct. On shipboard they have often strengthened the hands of naval captains in maintaining discipline amongst the sailors, who, on account of their uncertain service and free-and-easy ways, were often very insubordinate in times gone by. The celebrated case of the mutiny at the Nore developed this characteristic of the Marines in a remarkable manner. For a long time the sailors had felt aggrieved concerning their pay and allowances, but no overt act was committed until Easter Sunday of the year 1797, when the men of the ship *Queen Charlotte*, on being ordered to weigh, positively refused to stir 'unless the enemy's fleet put to sea.' All the measures for repressing the mutinous feeling having failed, and the men having tried to hold a convention on board the *London*, Admiral Colpoys had the marines under arms, and ordered them to fire on the mutineers; but these latter were too strong for them, and the whole of the marines and naval officers were taken prisoners. In fact, neither on this occasion nor on any other during all this trying time, did a man of the Marines join the mutiny. At Yarmouth Roads, too, where there was an outbreak of mutiny in the fleet under Admiral Duncan, the marines, by seizing the ringleaders on board the *Venerable*, quelled the disturbance. On this occasion, it is recorded of Captain David Wilson of this corps, that on the mutineers demanding from him the keys of the arm-chest, he threw them overboard, and told the sailors to go and fetch them. In 1798, there were serious popular disturbances in the kingdom, and again the marines were prominent in quelling the insurrection.

From the description given of the Marines from their first establishment down to the present day, it will be seen that they have always proved most useful soldiers, and admirably adapted for the service of an insular and maritime nation like ours. At first, they were required not only to fight on shore and on board ship, and to assist the sailors to work their ships, but to keep the latter in check. In the present day, however, Jack is procured, disciplined, and treated in a very different fashion from that of the olden time, so that the marine is no longer required as a check on the sailor. Moreover, since

Digitized by Google

the introduction of steam, and of a small number of powerful guns, in place of a large number of small guns, the crews of vessels of war have not been required to be so large. Hence it is that the recent idea of reducing the Marines was started. But the Marines are great favourites of the public. It is felt that they are just the reverse of the flunky who was 'for hornament,' not 'for work.' It is felt that on shore they are quite equal to our best troops, and on shipboard, of course, greatly their superiors. It is felt, moreover, that they are snubbed by the Admiralty and the navy, and treated coldly by the army. Therefore, the British public are, and naturally so, partial to the Marines, and by no means eager for their reduction.

There is one mode of employing the Marines, which assuredly any other nation in our position but our curious selves would have put in action: namely by garrisoning many of our isolated maritime dependencies all over the world with these troops. If this plan were adopted, the men might be taken out and brought back in our ships-of-war, and shifted from ship to shore and from shore to ship, as their health and the convenience of the service required; and a great portion of the expensive system of transports and the relief of invalids be rendered unnecessary. The great Nelson *is supposed* to have said, on the subject of employing Marines: 'When I become First Lord of the Admiralty, every fleet shall have perfect battalions of Marines, with their artillery, and commanded by experienced field-officers, to be prepared to make a serious impression on an enemy's coast.' Now, although we entertain no intention of making impressions on enemies' coasts in the present day, still we do require to possess the means of supporting and reinforcing our outlying dependencies. If we have too many soldiers, let us by all means curtail the number, but think twice before reducing one of the most useful and serviceable corps we have, our *per mare, per terram* sailor-soldiers.

LOST AT THE GOLD-FIELDS.

'D' ye mind the big snaw-storm o' saxty-three? Eh, but yon was an awfu' sair time. I was oot in 't mysel, and got near smoored, forbye losin' ane o' my taes, nippit wi' the frost. Mony and mony a wild storm hae I seen at hame afore I left bonny Scotland; but I never saw onythin' sae fearfu' bad as yon.'

A tall, well-built man was Sandy Macfarlane, the speaker. As he stood in the sunlight, leaning on a long-handled shovel, his muscular arms stripped to the shoulders, his well-developed throat bared to the breeze, and his bronzed features set in a shaggy framework of bright-coloured hair, he looked a very model of human strength. It must have been a fearful storm indeed to which a frame so powerful had been compelled to succumb.

I will tell the story nearly in his own words, only slightly toning down the rich Doric—reminiscent of far-away heathery braes—in which it was told to me.

'Ye see,' he continued, 'I had been workin' for a spell in Conroy's, on a bit claim there, when tidins cam' fleein' aboot o' a grand "rush" to a fine new gully somewhere oot ower the "Auld Man" Ranges. I had done gey weel in Conroy's, though I wadna hae tell 't ye sae if ye had forgathered wi' me at the time; but there 's no sae muckle harm in speakin' o 't the noo. Five punds and nine ounces—that 's saxty-nine ounces in a', ye ken—was each man's share; and a' braw, nuggety gowd—none o' your pouthery stuff, sic as the lads wash oot o' the sands o' the Molyneux, though I 'm no denyin' it 's vera gude gowd to get, when there 's plenty o 't.

'We had wrought oot our claim, and had just done "washin'-up,"* when the news got aboot. At first, I gave sma' heed till 't; but when Saturday cam' round, I thought I 'd just gae down to the township, to pit my gowd into the bank, and maybe hae a crack wi' a few cronies. As I was wantin' a few claes, I steppit intil a store—ye mind it weel: it was keepit by an auld Israelite that ca'd himsel the "Wonder o' the Warld;" and wha should be there buyin' bran-new blankets and rugs, and a hantle mair things, but Willie Cranston! I kent Willie fine, for we cam' oot thegither in the *Cheviot*. Sae I speered at him, was he bringin' hame his lassie, that he wanted sic a heap o' furnishins. And he up and tauld me that he had been ower to Campbell's (as they ca'd the new rush), and was mates wi' three ither lads in a claim; and how it was as cauld as the tap o' Benvoirlich there. Willie had been in a warehouse at hame, sae he was sent down to the township to buy blankets and sic-like, as he kent mair aboot these matters than ony o' the ithers.

'You may be sure we didna pairt without payin' our respects to the Kirkliston, though it 's but sma' bree that comes oot in bottles frae that still, and no to be compared to the grand auld Glenlivet. And Willie gied me sic an account o' the place he was workin' in, that I went back to my mates, e'en red-wud to be aff at ance; but they wadna hear tell o 't, for, as they said (and it was nae mair than truth), there was plenty o' grun' left in Conroy's yet, and maybe as gude as ony in Campbell's; and they thought me daft to leave it, as we had done sae weel. But "first at a feast, and last at a fray," was aye my way; sae we just pairted, no in anger, but gude friends, and I joined a party wha were settin' oot for the rush. Twa o' them were fine buirdly fallows; but the tither ane was a wee bit English laddie—a kind o' hafflins callant—ca'd Tam Page. He was a sonsie lad, wi' a trifle o' book-lear, and made the way lightsome wi' his queer stories and cheerfu' havers. I mind his tellin' that when he was at school he was ca'd the page that never turned ower a fresh leaf. I took a great likin' to the chiel, for he wasna strong; and aften when we were speelin' up the sides o' the ranges, I used to lighten him o' a pairt o' his "swag."† Not that he ever complained; for he aye set a stout heart to a steep brae, and tried to keep up wi' the lave; but I could see it was ower muckle for him. And eh, the weary work we had afore we gat to the tap o' the Auld Man! Puir Tam was right-down dunted; but for a' that, his een fairly glinted wi' pleasure, as he loot his

* The process of gold-washing is so termed.

† Any burden is usually spoken of as a swag.

Digitized by Google

swag fa' to the grun', and lookit round at the prospect. Weel, it was a bonny sight, nae doubt, wi' the Dunstan Plains and the Teviot far below us, and the tents shewin' like wee specks in the distance, and the Molyneux wimplin' alang like a siller thread in the bottom; and the Leanin' Rock, and the Knobbys, and the Lammerlaws, and mony ither mountains that I dinna ken the name o', standin' boldly oot in the wanin' sunlight. But I think I cared mair just then for a gude scone, or a cog o' parritch, wi' a pannikin o' tea, and maybe a drap whisky to end wi', than for ony prospect in the warld.

'We campit oot the first night in a neuk o' the mountain, and mony a fire forbye ours glimmered on the face o' the brae; for by this time the tidins had spread through the diggins, and folk were makin' their way to the rush frae a' pairts. Next day we gat up early, and were the first to reach Campbell's. Sae, as we had the pick o' the grun', wi' Willie Cranston's advice, we sune markit a claim; and a gude claim it turned oot. Ane o' my mates, wha had been in Victoria, said it minded him o' the claims he had worked in at auld Gowden Point and Eaglehawk. Nae doubt, as ye are sae weel acquent wi' Victoria, ye 'll ken what that may mean, so I needna say ony mair. But I tell ye the wash-dirt * was a braw sight for sair een. We wrought there easy for a time; but as the winter creepit on, the water would whiles get frozen up, sae that we could only work for a few hours in the day, and aften no at a'. And when August cam', the burn wad stop rinnin' for days thegither. Then a little snaw began to fa'. At first, it wad melt awa'; but after a while the grun' got that hard that ye couldna pit a pick † intil 't. And the snaw didna melt then; but it got deeper and deeper, till it covered up a' the claims, and lay upon the grun' sae hard and firm that ye could step on't without breakin' the crust.

'Still, we didna care to leave the gully; for a'body said the snaw wad sune be gane, and the claim was far too gude to lose. Sae we stopt on, and amused oursels as weel's we could in our huts, whilin' awa' the time wi' cards and sic-like, or, as Tam said, leavin' our cards on our friends. Tam's cheery ways helpit us alang fine; for he had aye a blithe sang, or a jest, or a rantin' story to gie us at a pinch. But the cauld continued, and the snaw cam' down mair and mair. And the sma' store o' provisions in the gully began to dwindle, for nae packers cam' through till us, and folk began to think o' gettin' awa afore worse cam' o't. First they flitted, ane or twa at a time, then mair went, and at last they gaed aff by dizzens, and a' things got unco dreary wi' us then in Campbell's.

'There was plenty o' timmer in the gullies, and we had biggit a warm hut, but we couldna live on fire alane, and there seemed nae certain prospect o' a mair seasonable meal if we stopt ony langer. Sae one mornin' we got a padlock frae the store, and lockit up the hut (for we meant to go back when the weather broke), and shouthered our swags, wi' a number o' ithers a' bound for the Dunstan. There were twenty-seven o' us a' tauld; and it seemed as if naethin' could hinder us, for if ane fell, twa could help him on. But we had bided too lang for sic a journey, and we had a warnin', nae doubt, if we had but ta'en it. I mind weel as we took a pairtin' cup wi' our friend the storekeeper—auld Alick Burniewin', as we ca'd him, because he had a smiddy next the store—he said to Tam Page (and I hae often and often thought on't, for aiblins he was tauld what was to happen): "Tammy, my lad, ye 'd best stop in my auld smiddy, for it 's a cauld bed ye'se hae the nicht on yon range." Tam leugh, as his way was, and simply answered that he 'd rather lie in a cauld bed than a het ane, sae lang as he didna lie his lane. And wi' that we started for up the lang brae.

'The cauld white snaw covered the haill mountain wi' a braid white sheet, vera tryin' to the een, and sae thick ye couldna tell the gullies frae the hillocks, and no a glimpse o' the blue sky could we discern; but ower them a dour heavy cloud was hangin', and the air was snell and piercin'. Still there was no down-pour, and we a' expectit to mak' the low grun' on the tither side afore night-fa'. But it was no to be. Afore we were weel half-way to the tap o' the range, the snaw began to fa' in sma' feathery flakes, and as it did sae the day seemed to darken. Tam said it was the last kick; but I misdoubted that, for I hadna been herdin' nigh auchteen years at hame for naethin'. However, we gaed on and on, aye hopin' it would sune clear up. But the snaw fell thicker, and the wind rase and blew it in our faces till we were amaist blin' and fairly dazed wi't. Naethin' could we now see but snaw aboon and around. The government folk had pit up cairns and guide-posts a' the way, for some wha kent the kintra foreboded what was comin'; but the deil a cairn or onythin' else but the snaw could we see. Some o' the lads had travelled the track ower and ower again, and as they seemed to ken the road sae weel, we gave them the lead. But they sune gat bewildered like the lave, and by the time we won the crown o' the range, they kent nae mair where we were than the rest o' us.

'We had brought some sticks wi' us, to mak' a fire and boil our "billies" * wi'; and aboot mid-day we cried a halt, and got ahint ane o' thae big rocks, like broken-down pyramids, that are scattered all over the mountain. But a' we could do, the wind and the snaw pit oot the lowe, and it wadna bleeze mair than eneugh to light our pipes wi'. Sae we were fain to be content wi' a drap whisky and a smoke, forbye a trifle o' cauld provender; and then we had a kind o' consultation. Some were for gaein' back to Campbell's, and ithers were for gaein' on to the Dunstan. Tam and mysel took different sides. I had reckoned the time and counted the cost; and we had been frae seven till almost one strugglin' sae far, and it was still a lang way down to the river; and the storm was aye growin' fiercer; and abune a', we didna rightly ken our whereaboots, for we had fairly lost the track. But for a' that could be made oot against it, some o' the lads were downright headstrong to gae on in the vera teeth o' the tempest, for they said it was a' down-hill either way, and how could they gae wrang if they keepit gaein' down, and it was as far to Campbell's as to the river-side, wi' mony ither arguments, sic as wilfu' men use to their ain destruction. The upshot o 't was, that we pairted. Fourteen o' us turned to gae back to Campbell's, and Tam and twal ithers pu'd their bonnets o'er their brows, and pushed on for the Dunstan; for Tam, the silly chap, wadna be guided

by me. There were thirteen o' them—a maist unchancy number—and I did my best to keep the laddie by my side; but he just snapt his thumb in my face; sae I e'en let him gang his ain gate.

'I a'maist think I wad hae gane wi' Tam when I found him sae firm set to push on, for I was laith to leave him; but he angered me. It's o' nae special consequence the noo how it cam' aboot; but someway Tam cast it up till me that I was a coward for turnin' back.—"Tam," said I, "there ne'er was a Macfarlane a coward yet, and I'm sair vexed ye should hae used the word. I'll no harm ye, Tam; and I dinna wish to quarrel wi' onybody," said I, for I saw the lads girnin' a' round; "but if ony ither man here wad like just to say the same, I'll gie him twa-three powerful reasons for no ca'ing Sandy *Macfarlane* a coward."

'Weel, they up swag and awa' wi' that misguided bairn—wha but he—at their heid, and a' skirlin' out an uncanny sang aboot "John Brown's body moulderin' in the grave." And sae, ane by ane, God help them! they vanished oot o' sight into the mist and the drivin' snaw; and the clatter o' the sang deed awa' till the sound cam' faintly to us mingled with the sough o' the wind, like a maist gruesome and unearthly wailin'. And I turned back sick at heart, for somethin' tell't me I'd never see them again.

'But indeed, we werena in muckle better plight oursels, for it was a far road to the gully, and the snaw-drift had smoored our tracks, forbye fa'ing sae thick that we couldna see frae the tae end o' the line to the tither, as we trampit alang in Indian file. The first man had aye to tramp the snaw down, ye ken, which was vera tiresome wark; sae, when he was tired oot he wad stan' by, fa' behint, and anither wad tak lead in turn. There was nae rantin' or daffin amang us—we were in ower muckle trouble for that; and we trudged on in solemn silence, only broken by the crunchin' o' the snaw under oor feet, or whiles by a cry o' "Spell—oh!" when we were fain to rest oursels. As near's I can tell we had gane on like this aboot three hours, or maybe less, when a great cry cam' frae the rear, and I ran back to speer what was't was wrang; and I found that ane o' the lads was missin'; naebody kent how lang for he was the hindmost ane and it seems he must just hae drappit down in the snaw without a word. Weel, I got them to stop, while twa o' us travelled back a quarter o' a mile or mair to look for him. But we couldna find ony trace o' him; and though we "*coo-eed*"* wi' a' our strength there was nae answer but just the moanin' o' the wind as it sweepit by. We went back wi' the black tidins to our mates and a great fear fell upon us. Naebody spak', for a' were feared to say onythin'; but we lookit in ane anither's faces, and the shadow o' death seemed hoverin' ower us a'. Then without a word we cast off our swags and hurried on, like as if we were fleein' for life, as indeed we were.

'Sune after it cam' to my turn to step oot and take my place ahint. I counted the lads as they slippit by; and oh! my heart sank within me when I saw there were but eleven o' us left oot o' the fourteen that started frae the hill-tap. Gude forgie me if I did wrang, but I judged it best to say naethin' for as the gloamin' was comin' on we couldna bide to search for the puir lost fallows, and I didna wish to fright the lave. It was bad eneugh without that, sae I just keepit it to mysel. But presently ane staggert and fell down in a kind o' dwam in our midst, and a' we could dae, we werena able to rouse him; and to carry him was no to be thought o'. Then the lads got clean wud-mad. Willie Cranston wha was wi' us, and mysel did what we could to keep them a' thegither; but we couldna. They gaed aff, helter-skelter, ony way, and sae got scattert ower the brae-side like scared sheep. Willie and I and twa ithers keepit company for a time, but somehow in the dark and the drift we missed them baith, and there was Willie and mysel alane on the dreary mountain.

'It was an awfu' moment when we found it oot. There was nae sign o' the gully, and we werena quite sure that we were on the down-track. Willie gied a kind o' sab, and "Sandie," he said, "there's Ane abune a'; and if it's His will that we leave our banes in the wreath, let us dee like Christian men, and no like brute beasts."

'It was lang since either o' us had prayed to Him—the mair shame to us, for no mindin' the gude teachin' o' our forbears. But we knelt down there in the snawy wilderness wi' the cauld wind ragin' and howlin' round us and swirlin' the half-frosted flakes in our een; and we prayed for help and forgiveness in the hour o' our extremity, as few men ever pray mair than ance in the space o' a lifetime.

'Then we thought o' our mithers, wha little kent their bairns were sae sair pit till't that night; and I gave Willie a bit o' my hair and made him gie me some o' his; and we made a solemn compact and grippit hand upon't, that if ane o' us got back safe to the livin' warld he was to send it hame as a memento o' the ither. "And now Willie," said I, "there's just a wee drap whisky left, sae we'll mak' an end o't at ance; for if we dinna sune find the gully we'll never want whisky mair."

'It was unco dark noo sae that when we lifted a foot we werena vera sure where we should pit it down again. But I think we baith felt mair comfortable, and gaed on wi' a new courage. I'm no just sayin' that our prayers were directly answered; but God was gude to us. We hadna gane abune a few hundred yards, when a light flickered oot far down below us just as we turned the breist o' the hill; and we kent fu' weel that where that bleeze was there was life o' some sort. And sae it proved; for atween rollin' and lettin' oursels slip down we sune got till't; and eh! the feelin' o' thankfulness that cam' ower us when we found we were at the vera door o' auld Burniewin's smiddy.

'We were the first that cam' in, and when we tellt what had happened the folk fired aff guns to guide ony o' the ithers that might be wanderin' aboot in the snaw. And syne ane cam' and then anither; and a pairty that gaed oot in search wi' lights brought in three mair. But that was a'. Seven o' us were saved, and seven were lost in the drift that night.

'The storm had spent its fury afore morn; and three days after some folk cam' ower frae the Dunstan, for news had gotten abroad that five hundred men were snawed in and starvin' at Campbell's. A number o' the diggers volunteered for a relief pairty, and the storekeepers gied provisions and medicines and a' things needfu'; and they got horses and cam' right through till us.

* Coo-ee, the Australian call; can be heard afar off.

Digitized by Google

When they found the condition we were in they bided a while till the track was clear, and then took us in till the hospital for we were a' mair or less sufferin' frae frost-bites, whereby, as I mentioned afore, I lost ane o' my taes. But some were far worse than mysel and ane o' the seven deed on the way, and anither in the hospital; sae that only five were spared oot o' the lot that tried to find their way back to Campbell's.

'But no ane o' the thirteen that we pairted wi' on the range had reached the plains alive. A few bodies were found leein' alang the wayside and some no far frae the shanty they ca' Chamouni. It was thought that they had tried to mak' to the shanty for shelter; but the people that keepit it had flitted the week afore when the snaw first began to fa'; and there bein' nae light to guide them they werena able to find it. When the snaw was clean gane mair bodies were pickit up; and they were a' buried decently. I was aye speerin' for Tam Page, but I couldna hear onythin' aboot him, till ane day they brought me Tam's coat, that they tellt me had been ta'en aff his body. His "Miner's Right," * and some ither things that I kent weel were Tam's were in the pouches; and then I was sair troubled in my min' that I had ta'en a huff at his silly words and hadna forced him to come back wi' me that day.

'I got ower to Campbell's again as sune as I was weel eneugh to walk; and our claim and our bit hut were aye as I left them. Willie had lost twa o' his mates in the storm and I had lost a' mine; sae we pit the claims thegither and wrought them as ane. I had the hut a' to mysel, and whiles I felt unco lonesome, and then I wad gae down to auld Burniewin's for a crouse crack wi' folk. Weel, one night when I was there, Geordie Tamson, wha wrought higher up the gully, cam' birslin' in wi' a face like a dishcloot; and—"Sandie, man," said he, "div ye no believe in ghaists?"

'I didna weel ken what to mak' o' the question; sae I speered: "What for aye, and what for no?"

"Weel," he says, "I 'm no thinkin' ye hae done onythin' wrang by Tam Page; but I 'm feared he canna rest, for he 's been walkin' in the gully. And I saw his ghaist, as I was comin' down this vera night, as sure 's ye 're sittin' there."

'We a' leugh at Geordie, and tauld him he had been scared at his ain shadow; but he wadna hae 't. A' we could say, he stickit till 't he had seen the ghaist o' Tam Page beside the auld claim, and keekin' down in till 't. But the lads sae sair daffed him that he said nae mair, but sat silent and grumpy in a corner. Sae, when I got up to gae hame, I said till him: "Come awa' wi' me, Geordie, and we 'll hae a *deoch-an-doruis* † at the hut."

'Geordie cam' awa', and sae did Willie and ane or twa mair, and up we a' gaed till the auld hut. I was a bit dumbfoundered to see a light shinin' through the chinks o' the door; but I thought maybe the logs had bleezed up. But Geordie stopped us as we cam' near: "Wisht! wisht!" says he. "Whatna 's yon?" And, as true as death, I heard a faint croonin' o' the sang aboot "John Brown's body," just as I heard it when I last saw Tam on the big range!

'It dirled through me like a stang, and my heart louped to my mouth. Biddin' the lads stan' fast, I creepit up saftly, and keek't through a chink, and there was the figure o' a man sittin' by the lum and seemin' to warm its han's ower the lowe. At first its back was to the door, sae that I didna see its face; but after a while it half looked round, and I saw it was the vera likeness o' Tam Page; but sae pale and waesome was 't that I was fair dumb wi' fright.

'I signed to Willie and the lave to come up, and they a' saw 't. Some o' them were minded to flee awa'; but Willie said: "It 's no a ghaist ava'; but just Tam himsel." And wi' that he opened the door and the ghaist jumpit up and pit his loof in my ain; and then I kent that Tam Page after a' wasna dead but actually livin' in the fleah.

'It turned out that sune after thae unlucky thirteen got awa' frae us, they began to misdoubt they were on the right track, and some gaed this way and some anither, and Tam got pairted frae them a'. When he found himsel gaein' his lane, he thought on what he had aften heard aboot keepin' to a gully or a burn and aye followin' it down, when no sure o' the track. It 's the only safe course in sic matters and Tam owed his vera life till 't, under Providence. He wandered about a' that night, but his senses never deserted him, and his steps were guided—nae doubt on 't—to a spot where, by riggin' up a blanket he was able to get shelter under the lee of an ower-hangin' rock. I hae seen the place since, and there 's no anither the like o 't on the haill mountain-side. But he daured na gae to sleep for he was feart he might never wauken mair; and when he felt drowsy, he walked aboot, to rouse himsel. Neist morn he was awa' wi' the daylight; but though he could see the river before him he was sae weary for want o' rest that he couldna gae far, and at last was fain to lie down in despair. But afore the sleep o' death itsel' cam' ower him twa men passed by on their way in frae the Pomahawk, and Tam had just eneugh strength to "coo-ee" to them. Weel, they heard his cry and went back, and ane o' them took him up on his back, and sae they carried him by turns to their tent on the Molyneux. And as sune 's the weather cleared up they sent him on, wi' some friendly packers to the hospital at Tuapeka; but we kent naethin' o 't at the Dunstan. Tam had been sair bitten wi' the frost, but he aye had a gude sound constitution which helpit him to hirple ower the danger without ony loss o' his limbs; and when he was set up ance mair, his first thought was to gae back to Campbell's and seek for his mates in the auld place.

'I forgot to mention that afore he was fair pairted frae his company, he changed coats wi' ane o' them (as is aften done amang mates), which accounted for his claes bein' found on the puir creature wha deed in the wreath.

"O Tam, Tam," said I, when he had tauld us a', "I 'm wae for ye and for a' ye hae gane through; but what for did ye ca' me a coward yon time?" For, ye see, I couldna get it oot o' my min'. And he leugh in his auld wild way, and said it was just some trash that cam' intil his heid, oot o' ane o' thae rantin' ploys that a loon ca'd John Falstaff, ance said to bonny Prince Hal. And wi' that he grippit my han' wi' his puir wasted fingers, and said he didna intend to vex me. "And, Sandie," says he, "dinna bear malice for a thoughtless word, for I hae paid dearly for 't."

Sae, I e'en took the laddie to my heart again, and we haena pairted since syne.

'It's a' by and gane noo, but aften I gae through it a' ower again in my dreams; and then I start up in a cauld sweat thinkin' I'm sinkin' down—down in the snaw-drift. And when I wauken I seem to hear that wearisome sang o' "John Brown's body" in ilka blast that whistles round our hut.'

ST PAUL'S.

IN TWO CHAPTERS.—CHAPTER II.

The first vital blow was struck at the Church when Henry VIII. bade the bishop tell his clergy in the cathedral of St Paul's that they would have to pay his royal master one hundred thousand pounds, as penalty for having submitted to the legatine authority. The king himself had acquiesced in it for years; but there was no instrument to shew the royal licence, and his majesty wanted the money. The whole church, he contended, had incurred the penalty of Præmunire. Six hundred of the clergy attended the bishop's discourse: there was an attempt to keep the affair private, or at least only to admit a few. With difficulty, the officers succeeded in closing the doors. 'This only exasperated the tumult without. "We will not be left without, our fellows being within. We know not what the bishop will do with them." The unclerical multitude goaded them on; there was a rush at the door, which gave way with a crash, and in they all poured, lay and clergy, with a great rending of gowns and cassocks, crushing of caps, and all the wild affray of a London mob. One, it is to be hoped not of the clergy, struck the bishop's officer on the face. The chapter-house was filled to its utmost corner; it was long before silence could be obtained. At length, the smooth bland voice of the bishop, who maintained his calm self-possession, was heard above the tumult. "I marvel, my brethren, that ye be so heady, and will not hear what may be said unto you. I pray you keep silence, and listen to me with patience." He went on: "Friends! we are men, not angels. We have miscarried ourselves towards the king. All our promotions, goods, lands, and chattels are forfeit to him, and our bodies liable to imprisonment. The king, on the humble petition of us, the fathers of the clergy, has inclined, as he ever does, to mercy. He will release us from the præmunire on the payment of one hundred thousand pounds in five years. Therefore, I charitably expect you, brethren, to bear your parts in the payment from your livelihoods and salaries." The reply was prompt, brief, resolute, not easily answerable. "My lord, thirty nobles a year is but bad living for a priest, now that victuals and everything else is so dear; our poverty enforceth us to say: 'Nay.' My lord, we never offended in the præmunire, and never meddled in the cardinal's business. Let the bishops and abbots who have offended pay." High words were uttered, not by the bishop, but by his officers, no doubt offended at the insolence of these low priests to their lord and master. Blows were struck: the "temporals" backed the priests, so that the bishop himself began to quail with apprehension for his sacred person. With his silkiest tones, he pardoned their rude demeanour, gave them a hasty blessing, and entreated them to depart in charity. The bishop withdrew, and the priests too, thinking all was over, withdrew. But the bishop's pardon was only from his lips: he hastened to the Chancellor, Sir Thomas More. Fifteen priests and four laymen were arrested by the Chancellor's order, some committed to the Fleet, some to the Tower; they paid the penalty of their resistance by a long imprisonment.'

Once that the taxing of the clergy was begun, it went on apace; and as long as they paid, they were permitted every indulgence in the way of persecution. In 1535, they condemned in the cathedral nineteen wretched Anabaptists, men and women, and sent them to be burned alive, two in Smithfield, the rest in various provincial towns, as an edifying spectacle. James Bainham, terrified by the stern Stokesley, Bishop of London, recanted his opinions. 'The next day he recanted his recantation. He was taken to the Bishop of London's coal-cellar at Fulham, the favourite episcopal prison-chamber. There he was ironed, put in the stocks, and left for many days in the chill March weather. Bainham, after repeated whippings, was burned in Smithfield. Stokesley flew at higher game. He had a strong desire to burn Latimer.' This is not at all to be wondered at in Bishop Stokesley. Except Dean Colet, there was no such outspoken preacher in the church as Hugh Latimer, then Bishop of Worcester. He dared to say in St Paul's—it was just after Anne Boleyn's execution—before all the prelates there assembled, these pregnant words, addressed to the clergy: '"While they thus preached to the people that dead images, which at the first, I think, were set up to represent things absent, not only ought to be covered with gold"—(Did he glance at St Erkenwald, still in all his splendour?)—"but who ought, of all faithful, and church or people, yea in this scarceness and penury of all things, to be clad with silk garments, and those all laden with precious gems and jewels; and that, besides all this, images are to be lighted with wax candles both within the church and without the church, yea, and at noon-day, as who should say no cost can be too great; whereas, in the meantime, we see Christ's faithful and lively images, bought with no less price than his most precious blood (alas! alas!), to be an hungered, a-thirst, a-cold, and to be in darkness, wrapped in all wretchedness, yea to be there till death take away their miseries; while they preach those will-works that come of even our devotion, although they see not the necessity of works of mercy and the precepts of God; yet they said, and in the pulpit, that will-works were more principal and excellent, and, plainly to utter what they mean, more acceptable to God than works of mercy..... The cries of your convocation," Latimer goes on to say, "shall shew what ye have done, the fruit of your consultation shall shew what generation ye be of. For what have ye done hitherto, I pray you, these seven years and more? What have ye engendered? what have ye brought forth? What fruit is come of your long and great assembly? What one thing that the people of England hath been better of a hair? or you yourselves more accepted before God, or better discharged towards the people committed to your care? For that the people be better learned and taught now than they were in time past, to whether of these ought we to attribute it—to your industry, or the foreseeing of the king's Grace? .... What went ye about?

Digitized by Google

What would ye have brought to pass? Two things taken away?—the one that ye, I heard, burned a dead man" (this was William Tracy, dug from his grave and burned); "the other, that ye, which I felt, went about to burn one being alive" (Latimer himself—was Stokesley on his throne and Latimer's eyes on Stokesley?) "Ye have oft sate in consultation, but what have ye done? Ye have had many things in deliberation, but what one is put forth whereby Christ is more glorified, or else Christ's people made more holy?"'

Never did the cathedral ring with more noble words; if they who heard them had but acted on them, it is possible that it and its contents might have escaped the hands of the spoiler that were already menacing the sacred pile. But the audience were blinded to the church's peril; Stokesley, and Gardiner, and Bonner, and their likes were there, and leavened the whole mass. Even Ridley, present on this occasion, proved capable (in after-years) of helping to burn a poor crazy old woman. These things must be taken into account in order to estimate Latimer, to whose charge no cruelty or baseness has been laid, at his true value. It is terrible to track the footsteps of some of his contemporaries. When Rogers, the 'protomartyr of the English Church—and of the English Bible, which first came whole and complete from his hands'—was tried in St Mary Overy, upon the question of the pope's supremacy, he answered Gardiner thus: '"My lord, I do not believe that ye yourselves do think in your hearts that he (the pope) is the supreme head. . . . . For ye, and all ye be of the realm, have now twenty years long preached, and some of you also (Gardiner, Bonner, Tunstall) writ to the contrary, and the parliament had so long ago condescended unto it." Here Gardiner interrupted him, alleging that they were compelled to it by cruelty. "Cruelty!" answered Rogers, "if 'twas hard that your eminences were persuaded by cruelty, would you have us persuaded by cruelty?"' By Gardiner first, and Bonner afterwards, this man, upon his way to be burned alive, was refused a parting interview with his wife and children.

When Bonner was deprived of his see, his mother and sister still resided at Fulham, and were constant and welcome guests at Ridley's hospitable board. 'The place of honour was always reserved for our Mother Bonner.' Under such circumstances, it is scarcely to be credited that, when Bonner became bishop again, he should have assisted in Ridley's burning; but he did so. At the execution, the preacher, one Dr Smith of Whittington College, took for his comfortable text, 'Though I give my body to be burned, and have not *charity*, it profiteth me nothing.' Certainly it requires something more (or less) than charity to excuse such men and such deeds.

Bonner was never burned, but only suffered one imprisonment, which 'turned to his safety, being so hated by the people, that it would not have been safe to him to have walked in public, lest he should have been stoned or knocked on the head by the enraged friends and acquaintance of those whom he had but a little before so barbarously beaten and butchered. He grew old in prison, and died a natural death in the year 1569, not suffering any want, or hunger, or cold. For he lived daintily, had the use of his garden and orchards, when he was minded to walk abroad and take the air.' He had some coarse humour about him, which seems to be the only good thing he did have. As he went and returned from the Marshalsea prison to his trial, he had some passages of wit with the rabble. 'One said to him: "The Lord confound thee, or else turn thy heart." "The Lord," he replied, "send thee to keep thy breath to cool thy porridge." To another, saying: "The Lord overthrow thee," he said: "The Lord make thee wise as a woodcock." A woman kneeled down and said: "The Lord save thy life. I trust to see thee Bishop of London again." To which he said: "God a mercy, good wife," and so passed on to his lodging.'

He was never to be Bishop of London more, and with him disappeared much else that was more valuable. Ten years before his death, St Paul's had become the prey of the spoiler. Mr Froude's description of the wholesale robbery is but too true. 'In the autumn and winter of 1552—1553, no less than four commissions were appointed with this one object; four of whom were to go over the often-trodden ground, and glean the last spoils which could be gathered from the churches. In the business of plunder, the rapacity of the crown officials had been far distanced hitherto by private peculation. The halls of country-houses were hung with altar-cloths; tables and beds were quilted with copes; the knights and squires drank their claret out of chalices, and watered their horses in marble coffins. Pious clergy, gentlemen, or churchwardens, had in many places secreted plate, images, or candlesticks, which force might bring to light. Bells, rich in silver, still hung silent in remote church towers, or were buried in the vaults. Organs still pealed through the aisles in notes unsuited to a regenerate worship; and damask napkins, rich robes, consecrated banners, pious offerings of men of another faith, remained in the chests of the vestries.' 'Who seized, who appropriated, who profaned the splendid banners which had waved over the processions in St Paul's and from St Paul's? To what baser uses were the countless gorgeous vestments—the copes, the albes, the chasubles, degraded? What became of the plate, the jewelled and enamelled vessels—the flagons, the chalices, the patens concealed? Whither went some of the splendid altar-cloths, singularly enough, we can shew. Spanish cathedrals still boastfully deck themselves in the spoils of St Paul's.'

A few years more, and profanation was added to spoliation. In Cromwell's time—of whom a strange story is told, that he meditated selling the cathedral to the Jews—'the portico was let out for mean shops, to sempstresses and hucksters, with chambers above, and staircases leading to them. The body of the church, the sacred building, Dugdale, who saw it, declares with sorrow and bitterness of heart, became a cavalry barrack, a cavalry stable. The pavement was trampled by horses, the tombs left to the idle amusement of the rude soldiers, if religious, not much disposed to reverence the remains of a popish edifice. Sir H. Ellis has quoted a curious notice from a printed paper in the British Museum, dated May 27, 1651: "Forasmuch as the inhabitants of St Paul's Churchyard are much disturbed by the souldiers and others, calling out to passengers and examining them, though they go peaceably and civilly along, and by playing at nine-pins at unreasonable hours. They are therefore to command all souldiers and others that hereafter there shall be no examining and calling out to persons that go

Digitized by Google

peaceably on their way, unless they do approach the guards, and likewise to forbeare playing at *nine*-pins and other sports from the hours of nine o'clock in the evening till six in the morning, that so persons as are weak and indisposed to rest may not be disturbed."' But it is not to be imagined that even at a much earlier date the cathedral was always treated with reverence. Upon the whole, we have now-a-days much more respect for sacred places than was entertained by our more superstitious forefathers. An act of the Common Council so early as 1563, complains that many of the inhabitants of London were accustomed 'to make their common carriage of great vessels of ale or beer, great baskets full of bread, fish, flesh, and fruit, fardels of stuff, and other gross wares, thorow the cathedral church of St Paul's, and some in leading mules, horses, and other beasts irreverently to the great dishonour and displeasure of Almighty God.' Again, 'the Elizabethan literature teems with passages which shew to what base uses the nave and aisles of the cathedral were abandoned, as lounging-places for the idle and hungry, for knaves, thieves, ruffians, or women; a mart for business of all kinds, even the lowest and most coarse. The walls were covered with advertisements, not always the most decent; it was the unrebuked trysting-place of both sexes, the place where villainies and robberies were plotted; where everything was bought, sold, hired. Shakspeare makes Falstaff buy Bardolph in Paul's; servants bought and hired there were proverbially no better than Bardolph. Parasites who wanted a dinner haunted what popular fame had transmuted into the tomb of the good Duke Humphrey. There was a noble monument of the Beauchamps at the foot of the second column, at the north-east end of the nave. This was changed into the tomb of the old duke (who was buried at St Albans), and hence the common proverb, "to dine with Duke Humphrey!"' From 1378 down to Bonner's time, the cathedral was used as a theatre, in which plays—quite other than sacred ones, and, indeed, some of most indecent character—were acted by the choristers.

The first Lotteries in England were drawn at the west door of the church in 1569; 4000 lots, at tenpence a lot—the prizes being plate, and the profits to be applied to repairing the havens of the kingdom. Seventeen years later (on the verge of the Armada invasion), another lottery was held, wherein the prizes were armour.

Until very recent times, we had only two accounts of that great fire in which old St Paul's shared the fate of a hundred other London churches—that of Pepys and that of Evelyn. On the 7th day of September 1666, and on the seventh after the conflagration began, the former walked into the city, and 'saw all the Town burned, and a miserable sight of St Paul's Church, with all the roof fallen, and the body of the quire fallen into St Faith's.' On September 4, writes Evelyn: 'All Fleet Street, the Old Bailey, Ludgate Hill, Warwick Lane, Newgate, Paul's Chain, Watling Street, now flaming, and most of it reduced to ashes; the stones of St Paul's flew like grenades, the melting lead running down the streets in a stream, and the very pavements glowing with a fiery redness, so as no horse nor man was able to tread on them, and the demolition had stopped all the passages, so that no help could be applied, the eastern wind still more impetuously driving the flames forward. Nothing but the almighty power of God was able to stop them, for vain was the help of man.' But of late years, there has been disinterred a fuller and more interesting account of this awful event by a third eye-witness, one Dr Taswell, who was at the time on the point of admission as a king's scholar at Westminster, and seems to have had the spectacle deeply graven upon his boyish mind. His testimony is peculiar, inasmuch as it contradicts the generally received opinion that no lives were lost in the fire that consumed so many human habitations. On the second day of the catastrophe (Monday), the Dean of Westminster, with all the Westminster boys, including the narrator, set gallantly forth into the city to do what they could in aid. The people who lived near the cathedral, says Taswell, placed the greatest confidence in its absolute security, by reason of the immense thickness of its walls; they placed all sorts of goods in it, and in the Church of St Faith (which was *under* that of St Paul) they deposited libraries of books, and with great caution and prudence, even the least avenue by which a spark could enter was stopped up. 'But this precaution availed them little. As I stood upon the bridge' (a small one over a creek at the foot of what is now Westminster Bridge), 'among many others, I could not but observe the progress of the fire towards that venerable fabric. About eight o'clock it broke out on the top of St Paul's Church, almost scorched up by the violent heat of the air and lightning too, and before nine, blazed so conspicuous as to enable me to read very clearly a 16mo edition of Terence, which I carried in my pocket.' On Thursday, Taswell made an expedition eastward upon his own account. 'The ground was so hot as almost to scorch my shoes, and the air so intensely warm, that unless I had stopped some time upon Fleet Bridge to rest myself, I must have fainted under the extreme languor of my spirits. After giving myself a little time to breathe, I made the best of my way to St Paul's.

'And now let any person judge of the extreme emotion I was in, when I perceived the metal belonging to the bells melting; the ruinous condition of the walls, with heaps of stones, of a large circumference, tumbling down with a great noise just upon my feet, ready to crush me to death. I prepared myself for retiring back again, having first loaded my pockets with several pieces of bell-metal.

'I forgot to mention that near the east end of St Paul's' (he must have got quite round the church), 'a human body presented itself to me, parched up as it were with the flames, white as to skin, meagre as to flesh, yellow as to colour. This was an old decrepit woman who fled here for safety, imagining the flames would not have reached her there; her clothes were burned, and every limb reduced to a coal. In my way home I saw several engines which were bringing up to its assistance, all on fire, and those engaged with them escaping with all eagerness from the flames, which spread instantaneous almost like a wildfire, and at last, *accoutred with my sword and helmet*, I traversed the torrid zone back again.'

Taswell states that the papers from the books at St Faith's were carried by the wind as far as Eton; and that even at Oxford the rays of the sun seemed to be tinged with an unusual kind of redness, while a black darkness seemed to cover the whole hemisphere. On the seventh (that is, the sixth of

Digitized by Google

the fire), Taswell got as far as London Bridge. 'I was infinitely concerned to find that stately church, St Paul's, now a sad ruin, and that beautiful portico (for structure comparable to any in Europe, as not long before repaired by the late king) now rent in pieces, flakes of vast stones split asunder, and nothing remaining entire but the inscription on the architrave, shewing by whom it was built, which had not one letter of it defaced. It was astonishing to see what immense stones the heat had in a measure calcined, so that all the monuments, columns, friezes, capitals, and projections of massy Portland stone, flew off even to the very roof, where a sheet of lead (covering a great space no less than six acres by measure) was totally melted. The ruins of the vaulted roof falling in, broke into St Faith's, which being filled with the magazines of books belonging to the stationers, and carried thither for safety, they were all consumed, burning for a week following. It was also observable that the lead over the altar at the east end was untouched, and among the monuments the body of one bishop remained entire. Thus lay in ashes that most venerable church, one of the most ancient pieces of early piety in the Christian world, besides near one hundred more.' And thus perished the cathedral that had stood 'brooding over London, a silent witness of all the civil and religious revolutions of England,' since the time of William the Norman.

The present edifice, as every one knows, built by Sir Christopher Wren, narrowly escaped being erected by a Frenchman, one Perrault, who had been invited by Charles from Paris; but he fortunately declined the undertaking. Wren, son of the Dean of Windsor, was one of those few precocious geniuses who fulfil the promise of their youth. At thirteen he presented his father with an astronomical instrument of his own invention; at Oxford, Evelyn tells us, the lad was considered 'a miracle' of learning; 'a rare and early prodigy of universal science.' His range was 'boundless, all-comprehensive. Nothing was too profound for his restless mind. In astronomy, Wren became Savilian Professor of Astronomy at Oxford, Gresham Professor of Astronomy in London. In the higher mathematics he gave a solution of Pascal's celebrated problem; in aërostatics, he claimed to be the inventor, at least the first who, with his friend Boyle, ascertained the use and value of the barometer; he studied chemistry, mechanics—for him nothing was too profound, nothing too minute. Orders are sent to him from the king (Charles dabbled in scientific pursuits) to send up his lunar globe, and at the same time to continue his microscopic investigations about insects. There is extant a catalogue of no less than fifty-two inventions or discoveries, some of high importance, claimed by or attributed to Wren.' It is most curious that Wren had had no special cultivation as an architect; he had not even seen St Peter's, which his own creation was in some sort destined to rival. The great Roman temple, it must be remembered, 'has some insuperable advantages. Let us imagine what would be the effect of St Paul's, rising in its grace and majesty, and basking in the cloudless sunlight of the Italian heavens, instead of brooding under a dense and murky canopy of vapour, up to a pale and lifeless sky. See, too, the vast open area in which St Peter's stands.' Yet even as it is, St Paul's is undoubtedly one of the grandest and most beautiful churches in Europe—*outside*. 'Wren's designs for the interior were not only not carried out, but he was in every way thwarted, controlled, baffled in his old age, to the eternal disgrace of all concerned, the victim of the pitiful jealousy of some, the ignorance of others—the ingratitude of all.' The history of the great architect's woes in connection with this great work, as told by our author, is indeed quite painful to dwell upon. The first stone was laid on June 21, 1675, and a curious incident took place at its commencement. 'When the surveyor in person had set out upon the place the dimensions of the great dome, a common labourer was ordered to bring a flat stone from the heaps of rubbish (such as should first come to hand), to be laid for a mark and direction to the masons; the stone which he immediately brought and laid down for the purpose happened to be a piece of a gravestone, with nothing remaining of the inscription but this single word in large capitals, RESURGAM.'

What remains of interest to be told of the great cathedral is within living memory, although, perhaps, few recollect that robbery, half a century ago, by which all the sacramental plate—nearly two thousand ounces—was carried off, none of which has ever been recovered.

Dean Milman himself was present, as a mere lad, at the burial of Nelson, and performed the funeral service over Wellington. Those two great captains, one—

> The greatest sailor since our world began,

the other—

> Great by Land as he by Sea,

lie side by side together in St Paul's; and it is in its possession of their honoured dust—a National Treasure—that the vast cathedral looms grandest, and will ever loom in the eyes of Englishmen.

A PERFECT TREASURE.

CHAPTER XVII.—MY AMPHIBIOUS FRIEND.

I AM now coming to an event, with the narration of which, since the experience happens only to very few persons, and those of an illiterate sort, I might hope, from its very rarity, to interest my readers; but, unfortunately, circumstances unqualified me for the task of description. Had the event occurred to me a few days earlier in my little life-story, I venture to think I might have related it to an audience that would not have refused me their attention; or, had it happened later—supposing that nature had exerted her healing forces, and made me myself again—then also I might have succeeded. But if, at the period of which I speak, my mind was not absolutely off its balance, it was worn and weak, disturbed by vague desires, and altogether unfitted for receiving or retaining impressions however striking.

On the afternoon which first found me alone at Hershell Point, and within an hour or two of the burial of its late master, I was sitting in his deserted chamber, looking as usual out to sea, when, among the well-known objects in the bay, I suddenly perceived a new one. A small sloop had rounded the extremity of the reef, and cast anchor immediately over the spot where the Indiaman lay sunk. I had myself visited the place in a small boat, and gazed down with a beating heart through the still blue deep upon what the sailors

Digitized by Google

had assured me was the veritable wreck itself, wedged upright between the rocks almost in the same position as when she had sailed upon the surface; but, to my comparatively unaccustomed eyes, the water seemed a little darker in the spot thus indicated, and that was all. Why the sloop had stationed itself there, I could not imagine; but it was evident, from the number of small boats that were making for it from the shore, that a great significance was attached to its presence. I was out of the house in a moment, and ran down to the shore. Let it not be imagined that I was actuated with any mere object of curiosity, or that I seized with avidity on any opportunity of forgetting the loss which had so recently befallen me. It was because I remembered it so well, because I lamented my dear protector so truly, that I was thus moved. That wreck, as I believed, still held the secret which he had enjoined upon me to become possessed of; and anything that seemed to connect itself with that, had an attraction for me which it is impossible to describe. An old fisherman of my acquaintance and his son were putting off just as I reached the beach, and I jumped into their boat.

'You are going to that sloop yonder, are you not?' inquired I.

'Ay, ay, sir. Everybody seems to take his look at her, and so why not we? Not that she's much of a craft to look at neither, except for what she carries.'

'And what is it she carries?'

'Why, bless my soul, sir, don't 'ee know? Why, they was talking of nothing else this morning up at the *Rainbow*. But I forgot you were otherwise engaged, Mr Marmaduke;' and the man pointed respectfully to my black clothes and the deep band round my sailor's cap. 'He was a kind soul, was your good uncle, and we shall all miss him, old and young, in this place.'

'But the sloop,' said I, 'why is she anchored out there, where nothing has anchored before?'

'Well, sir, Lloyd's has sent her down to pick up the pieces. When a ship went down in my time, she was gone, and there was an end of her; but now, if she has not sunk in very deep water, and what is known to have been in her makes it worth while, they send down a craft like that with divers in her.'

'Divers!' cried I joyfully; and in a moment I forgot restless nights and foodless days, and snatching up the spare oars by my side, began to aid the boatman. How fortunate it seemed that I had remained at Hershell now! There was surely a hope, and a good hope, of wresting from the sullen sea its secret yet.

'You see, sir,' went on the old man, 'the Indiaman had treasure on board; they do say fifty thousand pounds in gold; and luckily the weather has been calm, just as if wind and wave had wore themselves out with that last gale; so that, though they have wasted precious time, there is a chance of getting something worth having out of Davy's Locker. They 're setting to work already, you see.'

But although, with my head turned half-round, I was watching the sloop earnestly with every oar-stroke, I could see nothing save a bright gleam of the winter sun suddenly strike, as it seemed, the vessel's side, and then become quenched in the waves.

'That was the diver's helmet, Mr Marmaduke. He has just gone under.'

In a few minutes or two, then, that man, whom I had just seen disappear beneath the sea, would visit the wreck, would doubtless go on board of it—if one might so speak of what was under the water—would perhaps even see the very Thing of which I was in search, and which I would have given ten years of my life to stand face to face with! I could hear my heart beat between the pulses of the oars.

We were received, though not very willingly, on board the sloop; the number of visitors had somewhat interfered with the operations: half the inhabitants of the little hamlet were standing on her deck, looking on with wonder at the mechanical contrivances, or watching at the ship's side for the return of the diver, with scarcely less of awe than those who, by the Pool of Bethesda, awaited the angel's advent. On the platform beside the air-pumps stood the men whose mission it was to minister to the wants of their comrade beneath, to attend to his slightest signal, to give their undivided care of eye and hand to him, and to him only. They were forbidden to interchange a word even with one another, lest their attention should be diverted for that instant, which might perchance be a fatal one to the adventurer below. For my part, I could not keep my eyes off the rounds of the little ladder, which, fixed to the ship's side, led down it to the depth below, and had its foot resting on the very bottom of the sea. I could count, through the clear blue water, no less than eight of these rounds, after which nothing was to be seen; yet the man who had just left his fellows in air and sunlight, to explore the unknown floor of ocean, had to descend fifty feet lower than our sight could reach. The *Star of the West* had gone down in ten-fathom water.

We had in reality scarce a quarter of an hour to wait, though to me it seemed a weary time ere bubbles of air began to make their appearance on the surface, and then a bright, round, luminous mass pushed through it, which was the helmet of the diver. It was a frightful sight, that exaggerated likeness of a human head, with its huge goggle-eyes of glass, coming up from the depths of the sea; while the metal collar round his neck, and the leads about his shoulders, and the gray dripping garments that clothed his lower limbs, were almost equally striking. A dagger was stuck in the belt about his loins, and his great shoes were soled with lead. It took several minutes, and more than one *valet de chambre*—each a grinning seaman—to disencumber this marine monster of his upper clothing, and transform him into a creature of the land. Then his face shewed an honest fellow enough, with nothing of peculiarity about it except a certain air of gravity and determination, that redeemed the commonplaceness of the features. He went down the cabin-stairs to make his report to some official, and then we Hershell folks were informed that we had had our treat, and must now depart, for that our presence interfered with business. There were coils of gutta-percha looking tubes, and things more delicate than are usually found on shipboard, strewed all about the deck, and perhaps it was feared some damage might be done. But while the rest of the visitors obeyed, and took to their boats, I spoke a few words with one in authority, and added thereto a golden reason for my remaining where I was; and the old fisherman, having also explained that I was a young

Digitized by Google

gentleman of distinction, and the proprietor of the mansion in the foreground, I was presently made welcome enough by the skipper himself.

It seemed, by the report of the diver, that the Indiaman stood really almost upright and fast between certain rocks, but had been so beaten about by the fury of the storm, that it would be difficult to effect an entrance; and for this purpose, when he took his second trip, he carried an axe with him, which rendered his appearance still more formidable. I had made this man also my friend, by adding another metallic substance to the various weights with which he was furnished, and had given him to understand that a true narration of all that he found on board the sunk ship would be well remunerated. On this occasion, he remained under water for a considerable time, and when his helmet was removed, appeared greatly exhausted. He had entered the Indiaman, but had been unable to make his way to the strong room, the reasons for which he gave at length to his superior. When I pressed him for details upon other points, he said that was not the time for spinning yarns; and when the others asked him how he had fared, he replied surlily that it was altogether an Ugly Job. It seemed that he was a good deal put out by having to undertake the adventure alone—a mate who had promised to work with him having broken faith at the last moment. Having made a third trip, as fruitless as the other two, he resisted all solicitation to make another that day, and the weather still holding calm, it was arranged that the next descent was to be made at sunrise.

'I am going ashore, young sir, for the night,' said he, 'for I am a landsman when I am not under water; and if you choose to come and stand a pot and a pipe at the inn, I can then tell you my story.'

'Nay,' said I, 'you shall lodge at my house yonder, and be welcome to all that it affords.' For, indeed, there was no other human being whom I was just then so inclined to greet as guest as the man who had explored that sunken ship, and doubtless come face to face with its drowned company.

So, within an hour or two, John Dewsnap, this new amphibious acquaintance of mine, was sitting with me after dinner in the study at the Point, with one of those cheroots between his lips which master and man had been wont to prize so highly, but which neither was to smoke again. Curiously enough, now that I was free to ask any questions I pleased regarding that matter which was so near to my heart that for the present it almost ousted loving regret itself, I felt averse to the subject; or perhaps rather, I feared to put the inquiry direct, an answer to which in the negative would have crushed all my hopes at once. I preferred to encourage my companion to talk of his experiences elsewhere than on Hershell Reef; and certainly they were strange enough, and would, under ordinary circumstances, have interested me deeply. My eyes were fixed earnestly upon the speaker; I scanned with the deepest concern those bluff and honest features, upon which perhaps the filmy eyes of the dead Hindu had so late been fixed, and he doubtless imagined me a wrapt listener. But in truth I scarcely heard him. I remember dimly what he did say, but I mix his various weird adventures up one with the other, so that the whole resembles the recollection of a nightmare. There was one touching story, however, which survives the rest—how on the south coast somewhere, when engaged upon a sunken emigrant ship, which had struck a rock at night in smooth water, and gone down when all the passengers were sleeping, he had found a young woman lying peacefully in her berth with her long dishevelled hair floating like seaweed; and how he had told of this until the rumour reached her betrothed, a young officer of the line, who had come down and put her photograph into his hand, and said: 'Is that the girl you saw?' And when he answered 'Yes,' the young man besought him to cut off a lock, and bring it up to him, as the last token of his dead love, and to take from her finger the ring which he had given her as the sign of their betrothal.

'And did you do it?' inquired I.

'Well, sir, I cut the lock off; but to despoil the dead, even though it was no robbery, I dared not. You don't know what it is to see folks lying beneath the sea, not motionless, as on a death-bed—ah, sir;' and a shudder ended the sentence, and Mr Dewsnap took his whisky and water all at a gulp, and helped himself to more. 'No, Mr Drake, mine is an ugly trade enough as it is, having to look upon drowned folks, without meddling with them. I don't mind breaking into the strong rooms and getting out the gold for my employers; but for nobody on earth have I ever touched a drowned fellow-creature, except that once, to please that poor young fellow, and no money would have tempted me to do that.'

'But, surely,' urged I, 'if there be anything, such as important papers, for instance, which may be even more valuable than gold, and of vital consequence to the living, a diver would not hesitate to recover it, even though it were upon the person of a drowned man?'

'Some divers maybe would not,' answered my companion coldly; 'but Jack Dewsnap would, if I know him. No, sir, it's bad enough to go about one's work with axe and rope, while such company are looking on, without having anything to do with *them*.'

'Are there any—any poor drowned folks,' asked I with a hesitation that my companion took for fear, 'in the ship you went down into to-day?'

The diver nodded. 'Yes, plenty. It's an Ugly Job, as I told you. The poor souls were under hatches, you see. The passengers, both fore and aft, are down below.'

How terrible it seemed to know that less than half a mile away there were swaying beneath the waves, in the very places built for them to live in, dead men and women, more numerous, probably, than all the inhabitants of Hershell village. But it was not only awe that seized me: I was devoured with the thought, that probably within the reach of this man's hand lay the secret of my life. And, oh, if I could but persuade him to bring it back to me from the depth of the sea!

CHAPTER XVIII.—IN ARMOUR.

'Did you happen to notice, Mr Dewsnap, any drowned persons in particular in either of the cabins? Forgive me, if I give you annoyance in asking such a question; it is not mere curiosity which prompts me, but something very far from that.'

'Well, sir, I honestly tell you I don't like to

Digitized by Google

talk of such things. It seems to me like telling something I ought not to tell—the secret of the Sea—as can at any moment—by the giving way of a valve, or the bursting of a tube, or the inattention of them fellows above—*be my death*, you understand. It may be a superstition, but I suppose I have a right to my own views;' and my companion puffed away at his cheroot in a manner which I had known in Tannajee to mean high displeasure.

'I am very sorry,' said I, 'to press you to speak on such a distasteful matter. But you once, as you told me yourself, did a very kind action to oblige a fellow-creature, and I cannot but think you will do another. Just answer me this, then—I cannot say—for I do not know myself—how much depends on your reply: Is there, or is there not, among the rest of the drowned persons in that Indiaman, a Hindu?'

My companion smoked like a furnace; then, after a pause, during which my brain seemed on fire, and all the objects in the room became indistinct, he nodded, and answered surlily: 'Yes; in the fore-cabin.'

'Then, if I were to give you twenty-five pounds,' said I, taking out my purse with the money with which Mr Glendell had supplied me for this very purpose, though under circumstances of which he had little dreamed, 'would you not take out of that man's waist-belt, to morrow morning, a pocket-book of sealskin which you will find there, and bring it to me?'

'No, sir,' answered my companion resolutely; 'nor yet for twenty-five hundred pounds. And let me add, though I am a poor diver, and you are a young gentleman, that you are doing wrong to tempt me.'

'It cannot be wrong,' urged I, 'to ask you to recover what is my own property.'

'Well, I can't do it, sir. If my mate were here now, he would no more mind such a piece of work than eating his bread and cheese. Men are not all made alike, you see. But besides that, and even if I could bring myself to do what you ask, I took an oath, when I cut the lock of hair from that poor girl (I seem to see her now looking up at me, as though to ask who is this that robs the dead!), that I would never more touch a drowned creature; and I am not going to break my oath; so there 's an end.'

'Is there any chance of your mate joining you?'

'Well, yes, I daresay he 'll come when he 's had his big drink out, for that 's what 's keeping him, *I* know. But when he does come, it 's ten to one the weather will have broken up, and perhaps the ship with it. I 'm sorry that I can't oblige you, sir, and I thank you for your entertainment; and now, since my work begins at sunrise, I must get to bed.'

'One minute,' said I earnestly. 'I am not about to ask you to do violence to your feelings, and far less to break your oath. But I see one way still wherein it lies in your power to help me.'

'Well, then, sir, you may consider that your request is granted,' said my companion cheerfully, 'for I should greatly like to be of service to you.'

'I thank you warmly, Mr Dewsnap; but beside my gratitude, I will gladly give you this same sum of twenty-five pounds if you will only let me put on your mate's apparel, and go down with you to-morrow under the sea.'

'Go down with me!' ejaculated my companion. 'Why, you don't know what you ask! I do not speak of the danger, for I could look after you as to that, but of the fear of the danger. The first walk under the water is no light matter, I can tell you, even to rough fellows like myself; but a delicate young gentleman such as you—why, you might swoon with terror; and as for going aboard that ship, and seeing the sights as I saw yesterday, why, it would kill you outright.'

'It will kill me outright,' said I solemnly, 'if you refuse this request of mine, my good friend. If I look, as you say, delicate, I did not do so a week ago, but was as strong as you are. It is the loss of that little packet of which I speak that has done it all. I can neither sleep nor eat for thinking of it. It contains all I have in the world. And as for fear, I cannot possibly be so much afraid of anything as of losing what it contains. Come, Mr Dewsnap; you have passed your promise, and I think you are not the man to go back from your word.'

'No; you are right there, sir; although, if I had known what you were about to ask, I should not have been so ready with my "yes." But unfortunately—or rather fortunately for you—the matter does not lie in my hands at all. The skipper would not permit your attempting such an adventure, even if I consented to be your companion. Otherwise, since you wish it so much, and feel such confidence in your own pluck, and offer so handsome a sum, I would have done it to oblige you, I would indeed.'

'If I have any knowledge of a man by his looks,' said I, 'the skipper is not one to get up at sunrise to see you over the ship's side; and as you know, he sleeps ashore at the *Rainbow*. Let us reach the sloop a little before daylight; so that I shall not be recognised, and do you clap my helmet on for me in the cabin. Then who can tell I am not your expected mate, arrived last night?'

Mr John Dewsnap exhaled his tobacco-smoke very slowly, gave a wistful glance at the bank-notes and gold which I had placed upon the table, and scratched his head with uncommon violence.

'Well, that certainly *is* a knowing dodge!' exclaimed he with undisguised admiration. 'When once the helmet 's on, as you say, there is no knowing one of us magnified tadpoles from another. Yet, if anything was to happen to you—and it *might*, you know—I should be tried for manslaughter.'

'You would be tried for nothing of the kind, my good friend,' returned I smiling. 'I go by my own urgent wish; so that, if anything were to happen, it would be suicide. I take that risk on my own shoulders.—Just put that money in your pocket, and go off to bed.'

'No, no, sir; I never receive my pay beforehand; and besides, if you didn't come back safe and sound, it would be like taking blood-money. But there; Jack Dewsnap's word has been passed, and so I 'll risk it.'

I wrung my companion's hand, and wished him a cordial good-night. As for me, though I was not afraid of oversleeping myself, I did not go to bed at all. Without the least apprehension that I was not legally competent to do so, for I was as ignorant of such matters as a child, I made my will, leaving all I had in the world to Rosa—that is, the future proceeds from the sale of the Point—with the exception of a legacy to each of the two servants, and something to dear Mrs Blunt, to shew her I had not forgotten her kindness. This document

Digitized by Google

my guest was to witness before I started on my perilous errand. Then I wrote a long letter to my darling, telling her how irresistibly I was impelled to undertake the coming adventure, and exonerating the diver all I could. I entreated her not to fret for long, even though she should never see me again, and wished her, with all my heart, a worthier lover. All this took me a long time, and longer because the fever of my blood made me unfit for writing of any sort. My anxiety was such that it seemed to me now that I had really not exaggerated matters when I told the diver that it would kill me if I were to lose what I had so set my heart upon—the recovery of the lost secret. Thus the night crept away; and one hour and a half before dawn I went to my companion's room, and awoke him.

'What!' cried he with amazement; 'and are you really in the same mind this morning, sir, that you were in last night? I did not think that it would have been so, I assure you. Well, you're a good-plucked one, at all events, so that I have the less fear of you when you and I shall be among the fishes.'

Seeing that I was still bent upon the undertaking, Mr Dewsnap very wisely did his best to keep my spirits up, and while we sat at our early meal, began to speak of the affair before us in quite a jocular vein. He made me eat in spite of myself, and after the meal he recommended a glass of brandy, which seemed to do me good. Then, as I led the way through the darkness to the beach, he impressed upon me a few matters to be observed during the task before us; all which I listened to most attentively at the time, but whereof I can recall little now, except that four pulls at the air-pipe meant 'Haul up,' which he reiterated again and again. 'Whatever you forget when the sea is rolling fathoms over you, be sure you remember *that*.'

The idea thus presented so often to my notice was not a pleasant one, but I was still firm of purpose. Once only, as we pulled across the cold dark bay for the sloop's light, I had it on the tip of my tongue to ask: 'Is there any chance, Mr Dewsnap, of your mate's turning up this morning?' but I did not put the question. I felt that it would unhinge me to discuss that matter. I was wound up to the very last turn of my mental machinery; nor, indeed, need this be wondered at. What were all the most trying *débuts* of youth compared with my case! The first tooth out; the first going to school; the first fight! Or even, to speak of the ordeals of later life, the first competitive examination; the first dining with a lord—tremendous essay for English middle-class adolescence—or the popping the question to the first Angelina! How all these pulse-hastening experiences fade to nothing before that adventure that was awaiting *me*—a descent into the unknown Deep, to meet the company of the unsheeted Dead.

There was no watch kept on board the sloop, and we clambered up into her unobserved, and went directly to my companion's cabin, the door of which he made fast. 'For,' said he, 'the hat you are going to wear is a heavy one, and you must not put it on until you are obliged.' Then once more he gave me my instructions, which I repeated after him word for word. Over my ordinary clothes, I pulled on many woollen garments ere I stepped into the gray india-rubber dress, all in one piece, which is the diver's uniform: this was tightly fastened around my neck; and about my wrists, to keep my sleeves secure, were placed tight india-rubber rings. Already I seemed to feel by anticipation the oppression of the superincumbent water; yet this part of my apparel was light and easy as a boating-dress by comparison with what was to come. Further operations were, however, for the present suspended, all being ready now for assuming my disguise at a moment's notice. The gray streak of morning had been stealing into the little cabin for some time before we heard any one stirring aboard the sloop; and 'The longer we wait the better,' said my companion, 'for the more light we shall have for our work, and the warmer will be the water.' But all this suspense was terrible to me, and I was glad enough to swallow another dram, drunk, as Mr Dewsnap cheerily said, 'to the success of our expedition,' but of which he doubtless perceived I had need. And yet I had only to think of the Secret now almost within my clutch to feel as resolved as ever to do or die.

'Is not it time to be starting?' said I at last.

'I will go on deck and see,' returned my companion. 'But it's no use your making your appearance there until all is prepared.'

'Will not my voice be recognised?' inquired I doubtfully; not that I feared that any Hershell men would be on board at that early hour; but I was conscious that it was rather a thin and tremulous voice, not so much like that of a professional diver as of a landsman who goes under the sea for the first time, and hardly expects to come up again.

'Whatever there is to fear, you need not be afraid of *that*,' answered Mr Dewsnap smiling. 'All folks as work under water talk alike, bless you; and lest any one should look in while I am away, by-the-bye, here's your hat;' and first having placed over my head a sort of woollen night-cap, he put on my helmet.—'Now, how does that fit, young gentleman?'

'It seems very large,' returned I, in tones that not even my darling Rosa could possibly have known for mine. Indeed, like Fear in Collins's *Ode to the Passions*, I started at the sound myself had made.

'There, did I not tell you,' cried my companion, 'that all folks as work under water talk alike!'

'I understand now,' returned I in mumbling grumbling tones, which had a prolonged echo.

Then left alone, I went to the little looking-glass nailed to the cabin's side, and surveyed myself through my huge glass spectacles, each like the bull's-eye of a policeman's lantern.

Certainly, no man could have identified me in such a costume, even if I were taken for a human being at all. My limbs, swathed in surplus clothing, looked double their usual size, and of the most ungainly formation; on my shoulders was a sort of breastplate of shining tin edged with copper, into which was fitted by screws a leathern jerkin, enclosing both chest and back. So far, I was cased, as it were, in villein's armour, the trappings of a common foot-soldier of the middle ages, except for the india-rubber and the leaden soles to my shoes, which weighed ten pounds apiece. But the knightly part of my garb, the helmet, with its monstrous vizor, was the most striking; its goggle-eyes and huge dimensions were alarming even to the wearer. As to the stories of divers thus appareled being attacked by sharks, I did not believe one word of them. No fish that swims, thought I, would venture to tackle

Digitized by Google

such an apparition, or wag a fin at it, except in swift retreat. Could any sight that I was presently fated to behold be possibly more formidable than my own appearance? Yet a long knife hung in a copper sheath by my side, as though there were really enemies to be dreaded. My thoughts were cut short by a shudder. Even what I now saw before me was not so horrible as what my imagination had of late conceived and my present fears anticipated. How merely grotesque was that masquerade of mine, in comparison with the dread realities of horror that awaited me; and with that idea for my sole companion, had I been left for long, I do not know but that my determination might have given way at the last moment; but, fortunately, the cabin-door opened at this moment, and Mr Dewsnap brought me the welcome news that all was prepared. He had put on his own uniform when he had attired me, so that there was no need of delay. 'Only one word more,' said he, 'while we are yet above sea. No one yet, Mr Drake, has ever come to harm while clad in this dress under English waters, and it is not likely that you will be the first victim, with a man who knows his business like Jack Dewsnap to take care of you.'

I clasped my companion's hand, and thanked him warmly for the good intention which had prompted this remark; but it was not worth while to tell him that I did not fear the going beneath the sea at all in comparison with the sights that I might meet there.

Then we two went up on deck.

THE MONTH:

SCIENCE AND ARTS.

Professor Phillips's visit to Vesuvius, which we mentioned last spring, has just shewn a good result in an interesting book on Vesuvius in particular, and volcanoes in general. As a scientific work, it is instructive and suggestive, and we observe that Professor Phillips makes out a periodicity in volcanic outbursts, thus corroborating the conclusions of other geologists. But the Vesuvian region, he says, has recently been much more disturbed, than in many years previously, and he is of opinion that we are now passing through a period of very severe struggle with the imprisoned energy of fire. If this opinion be well founded, we shall perhaps hear during the present year of earthquakes and eruptions as alarming as those which happened in different parts of the world in 1868. Professor Phillips's book is well worth reading; but we cannot say the same of an argument, published in Australia by a speculative geologist, to prove that the time is not distant when Rome will be swallowed by an earthquake.

In a paper read at the Geographical Society, another example has been given that rainfall is diminished by the cutting down of forests. It occurred in the province of Coorg, Southern India, where for some years large clearings of the dense forest were made for coffee-plantations. Less rain fell in consequence, and it is recommended that large belts of jungle be preserved to retain the moisture.

Most readers are now aware that ether-spray is used to produce insensibility in any part of the body during surgical operations. Much ingenuity has been brought into exercise in the construction of instruments to administer the spray, and it is now blown from a tube in a shower so fine that it may be called liquid dust. It has the advantage over chloroform that it does not deaden the whole body, but only the part to be operated on. Another use has been lately found for the instrument—namely, in applying washes, lotions, and gargles to the eyes, nostrils, or throat. And in this there is great advantage, for the fine shower can be confined to the affected part exclusively, and can be made to reach parts not accessible by ordinary means. But the greatest benefit may perhaps be looked for in the application of gargles: the patient will no longer have to fill his mouth with a nauseous draught, and go through the disagreeable operation of gurgling it in his gullet, but the shower of gargle will be directed to the inflamed part of his throat only, and its strength may be increased if needful without risk to the other parts of his mouth.

Dr Budd of Bristol has published an account of his method for preventing the spread of scarlet fever, which ought to find a place in every school and dwelling-house throughout the country. For nearly twenty years, the doctor has practised the method, and with entire success: his experience may therefore be trusted; and we find that the Registrar-general has published his approval thereof. He sets forth clearly all the precautions that ought to be used to prevent the spread of infection, and shews that if these are attended to, the disease may be cured in a comparatively short time, and without harm to the other inmates of the house. To counteract the diffusion of the poison in the dry scurf from the skin, he anoints the whole body, including the scalp, with olive-oil twice a day, beginning when the white dry eruption appears, commonly about the fourth day.

In the last volume of *Transactions of the Royal Society of Victoria*, published at Melbourne, there was an account of Dr Halford's interesting researches into the nature of the change produced in the blood by the poison of snake-bites. The doctor worked with the microscope, satisfied himself that there was a change, and described it, and has since had an opportunity of testing his theory and his antidote. A man working on a railway was bitten by a snake: ere long, drowsiness came on; medical assistance was obtained, but by the time it arrived, the man was comatose, and his lower extremities were paralysed. Dr Halford was then summoned by telegraph: he made an incision in a vein, inserted the point of a syringe, injected ammonia diluted with water; and the effect produced is described as 'marvellous and immediate.' The man became conscious, steadily recovered, and became quite well. Henceforth, let all people who live in districts infested by poisonous snakes remember that *ammonia injected into a vein is the remedy for a bite.*

How to build houses for labourers and poor folk, without incurring loss, has been a question much debated of late years. Mr B. Nicoll, known as an inventor, has recently shewn how, in some cottages built at New Hampton, near Twickenham. He compresses straw into slabs, soaks them in a solution of flint, to render them fireproof, coats the two sides with a kind of cement or concrete; and of these slabs the cottages are built. By ingenious contrivances, the quantity of joiners' work is much reduced, and the chimney is so constructed as to secure warmth with the smallest consumption of

Digitized by Google

fuel, and at the same time to heat a drying-closet. The cost of a single cottage of this description, combining 'all the requirements of health, decency, and comfort,' is eighty-five pounds. The Commissioners on the Employment of Children, Young Persons, and Women in Agriculture, report favourably of these cottages. To us, however, the cost appears too high, for thirty years ago we saw cottages of four rooms built of brick, with slate roofs, comfortably fitted inside, and respectably finished outside, which cost not more than ninety pounds apiece.

The explorers at Jerusalem have made further discoveries of underground structures—part of the ancient city—which have for generations been hidden by accumulations of rubbish and modern buildings. They have opened a vaulted passage, one side of which is massive masonry, the other perpendicular rock, and this rock is supposed to be the platform on which the Temple was built. Should this supposition prove true, the long-debated question as to the dimensions of the Temple may perhaps be settled; and the archæologists who hold that the extent of the building was not greater than appears in Josephus, may find their views confirmed. From this it will be seen that the exploration becomes more and more interesting; but it is unfortunate that, in order to lay open old Jerusalem, a large part of modern Jerusalem must be endangered or destroyed. Nevertheless, if we can succeed in getting a definite notion of what Jerusalem was like in the days of Herod, all the money, labour, and enthusiasm expended in obtaining that result will have been well bestowed.

News has been received also from the Sinai surveying-party, who are prospering in their task, laborious though it be. They had almost finished the great mountain-range, Jebel Musa, and were in expectation of soon beginning upon Mount Serbal. To carry on such a task in a region so barren, rugged, and precipitous, requires no small amount of strength and perseverance; but the observers were all in excellent spirits, and considered themselves repaid at times by the wide prospects opened to them, and the glorious effects of colour presented by landscapes bare and arid almost beyond imagination. They take photographs of the scenery, make regular meteorological observations, collect facts in geology, natural history, and archæology; and Mr Palmer, the orientalist of the party, is copying all the ancient inscriptions he meets with. Out of all this we shall surely get something like a competent knowledge of a land rich in sacred and historical associations; and the thousands of readers who take interest in the discovery of Scriptural illustrations will no doubt be abundantly gratified.

The danger and inconvenience attending the use of gunpowder for blasting in coal-mines are so great, that repeated attempts have been made to construct a machine that should break out the coal by mechanical means only. This, as we learn from a paper read at the Institution of Civil Engineers, has now been accomplished, and tried with satisfactory results in a colliery at Harecastle. The machine comprises a hydraulic press of twelve tons power, with bars and wedges, which, being brought to bear on the coal, one wedge is forced in after another, until a huge mass of coal weighing three or four tons breaks off, and falls. The advantage of this machine is thus apparent: the coal is 'got' without the danger of a blast, and in unusually large pieces, and there is no time lost in waiting for the smoke to clear away.

[By a letter from the office of the Peninsular and Oriental Steam-navigation Company, we are informed that the lecturer on a daily mail route to India (mentioned in the December *Month*) should have stated *about one-half* instead of 'one-fifth of the time required at present;' and that the average duration of the voyage to Bombay is twenty-two days, and not fifty, as the statement referred to implied.]

NEVERMORE.

The artless plans of childhood—the rambles through the wild wood—
The stories told by muses, or gleaned from fairy lore—
Of chieftain or of rover—too soon for us are over;
They charmed us in that pleasant time, but charm us—nevermore.

The youth's fond aspiration—to rise above his station
By deeds of early daring, or a prize from learning's store;
Too oft the light has faded, or shines upon us jaded,
As we resign the struggle, to combat—nevermore.

Or, after painful trouble, we find fame but a bubble,
And worn by disappointment, would seek some peaceful shore,
Lost is the better feeling that might bring sound heart-healing—
Repulsed each loving spirit, to come back—nevermore.

And sinking into old age, the future seems a cold page,
That we avert our eyes from, as fruitless to explore;
The dreary acts are ended, all energy expended;
The lamp of life is failing, to brighten—nevermore.

Improved issue of

CHAMBERS'S MISCELLANY

OF

INSTRUCTIVE & ENTERTAINING TRACTS.

Just out, Volume I., at a Shilling,

Containing:

LIFE OF GEORGE STEPHENSON, &c.
PICCIOLA, OR THE PRISON-FLOWER.
ABYSSINIA AND THEODORE.
CASES OF CIRCUMSTANTIAL EVIDENCE.
THE LAST EARL OF DERWENTWATER.
HOME PLANTS, THE AQUARIUM, &c.
ANECDOTES OF DOGS.
THE HEROINE OF SIBERIA, &c.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

BABIES BY THE DAY.

VERY few persons visit *crèches* or public nurseries, and very few persons care to do so; for the thing that is most like one is the Parrot Room at the Zoological Gardens. There is just such a din in it; just such a chatter; just such a hurly-burly, whirligig, confusing, hazy, topsy-turvy noise and aspect; and just such a swift sensation imbibed, that the best thing is to make short work of our stay there, and rush out in a trice. Some of us may know that one baby can produce such noise as is distraction; let one baby be multiplied by twenty, and let a fervid imagination conjure up the squall and squabble, and even then it will fall far short of the result. For in a public nursery a baby's cries are not hushed by the warmth and solace of a mother's breast. How could they be? A nurse or matron, and her assistant, are the staff of an institution of the kind; and that gives but four arms and two laps to the whole of the little inmates. These are made use of, though, most ingeniously and economically. We went to several of these places a short time since, and one matron we saw—an upright, wide, silver-haired Lupa of sixty, born, seemingly, to fit her name and office—was holding one baby in her left arm, close up to her bosom; she had another, to kick out and stretch, spread on her copious knees; she was keeping a third soothingly swinging with her right hand in an iron cot; and she was rocking a fourth to sweet silence, if not to sleep, with a touch of her right foot on its basket bassinette. Her eyes, and her voice, and her smiles were busy on other little personages even then. She was 'ketcherkoo'-ing one white-faced little trot relapsing into a whine; she was crying 'U-up again, then! u-up again!' to a small soul who had tumbled exasperatingly down; she was leaving off her left hand's labour for a moment to toss a plaything, or shake a rattle; and she was drying the tears of some discontented little totterer, and encouraging it to run away and pick up another toy.

But the hubbub, and wail, and racket of a nursery are, in spite of all these efforts, impossible to be quelled. 'Waa!' is the melody from one corner; 'Wa-a-aa!' more passionately, and in a tone lower, is the melody from another; and 'Wa-a-a-aaa!' sounds from the middle, and the sides, and left and right, lowly, loudly, from a weak hoot to a shrill scream, till there is every variety of *forte* and *piano*, *largo* and *affettuoso*, and there is occupation of every note in the scale. Feeding-bottles are an incalculable boon. Before the invention of the india-rubber tubes to attach to these, must surely have been before the invention of babies' day-boarding too. It is impossible to suppose the one thing without the other. In each iron nursery cot, in each snug bassinette (laid, for better warmth and watching, on the ground, and close round the large wide fire), wherever there is a little round soft head, with eyes that look up gravely when their quiet is disturbed, there also is a wee, wet, mobile mouth, busy at the *embouchure* of a feeding-bottle, sucking in liquid satisfaction. Conceive if no pillow and coverlet could be substituted for a bosom, and if each poor babe had to lie and scream with hunger and discomfort till there was opportunity to administer its meal! What would be the difficulties, then, if the matrons of these institutions are not without difficulties now? Said one matron: 'When you're a-walking with one baby'—she was in a nursery where some of the babies are boarded monthly and quarterly, and she had five with her always all night—'when you're a-walking with one baby, suppose another screams. Well, then, it wakes all the rest; and suppose their bottles have got sucked empty, how are you to fill 'em?' How, indeed! And how can these hard-worked matrons bear the screams, when they are not from their *own* babies, and no maternity works its magic on them, to make them think the sounds rich melody, and the little beings who are uttering them the most precious armfuls in the world?

O dear! it must be hard work when a baby *will* be restless and peal out its cry, if its flesh and blood are alien to us, and its poor eyes bring back no

Digitized by Google

memory, and its little smile inspires no hope. And what if it is in our care only as a customer, and the price of it is but twopence daily, and the child's clothes are not too clean or too often changed, and the mother that leaves it with us is less cleanly and seductive still? Even this twopence, too, has to be struck for. Women will bring only three-halfpence of it; or a penny; or perhaps a promise that it shall all come at night, when they have done their work, and earned their money. The matrons are forced to be very strict. If they give a few pence' credit, the probability is that the mother will never bring her child again; for if she did, she would have to pay her debt! But all this has, honourably and mercifully, no effect upon the child. In all the nurseries from which this account is taken, all the little creatures were treated perfectly alike. It was a matter even of necessity, one matron's experience had taught her, that it should be so. If a mother, coming to take away her baby, saw a matron kissing and fondling one, and taking no heed of hers, she would be as hot-blooded and sore as a wounded tigress. *Her* child is as precious as any other's; as choice; as comely; why should *they* be nursed and crooned over, and hers be neglectedly laid by? And yet there are some babies one's heart goes right out to instantly, and others so blank and pictureless there is no wish to look upon them twice! But this 'selection' must not be made a 'principle' (although, as Lupa Secunda said, 'it comes hard at times, for some children I could *heat*, and others I couldn't kiss, if it was ever so!'), or the popularity of the nursery goes, and no amount of voluntary subscriptions, or efforts of ladies' committees, will make it any more hold up its head.

A public nursery is generally up-stairs, over a suite of rooms used for cheap schools or other works of charity; and it is always beautifully clean and airy, and as cheery and sun-lit as crowded streets in a crowded quarter will allow. It has always the row of iron cots—some of them to swing, some stiff and still—for short-coated babies, and the reserve of snug basket-bassinettes for those absolute 'infants' only yet just emancipated from their 'month.' For more spaciousness and air, the door of the room is not kept shut, but the entrance is guarded by a half-door or palisaded gate. Little mottled legs crawl or toddle sometimes much greater distances than a nurse can calculate; and lest there should be a bump, bump, bump down a steep stair, and then a dead hush, and a little heap of white and flaccid limbs, the tiny investigators are put on one plain level, and locked securely in. Round this safeguard some of the little creatures throng curiously. Blue eyes, that look like a piece of heaven, peep through it for a glimpse of men and manners that holds them tranced; black eyes, with a flash and sparkle harmonising thoroughly with the bright crow that is the other evidence of quick delight, dart there for a short moment of brilliant fun; and when the concealed lock is touched that lets the gate go, there is a laughing scatter of such of these wee folks as are agile enough to run, or a flat and sounding sit upon the ground of the others who are not so nimble, or not so brisk-brained as to discover instantly what is going on. Little hearts are rent then, with pain or indignation, and little lungs utter a lusty cry; but there are things about for speedy consolation. The floor of the nursery is strewn with treasure; and dimpled hands, or poor white wasting ones, are soon stretched out to pick portions of it up. There is a bald doll, for instance, battered out of all likeness save that to be recognised in a column topped by a dilapidated globe; and it is raised in a pair of little arms immediately, and lulled to a mimic rest. There are some soft fluff balls, rolled, and tossed, and nursed into tints that defy description; and these are snatched at, and cuddled and sung to with a determination that of itself brings forgetfulness, and smiles all grief away. Then there is a magnificent wool bow-wow, that squeaked once, though it will squeak no more, and that is nothing but a legless, faceless, tangled mass; but it gives its solace swiftly; as do the wicker rattles, and the tin-sealed boxes with lively stones in them, and the dinted tea-trays, and the other well-worn objects that do duty for better things, and that might be chosen, perhaps, through baby caprice or tried affection, even in presence of all the rich novelties of a gorgeous bazaar.

There is a little group of small children here now, in a contest loud and clear. The *casus belli* is a tiny basket-perambulator; and the combatants (three years old, perhaps; their united ages—there are three of them—amounting, as the *Times* is often comically calculating, to nine years)—the combatants clutch at the wheels, and the sides, and the handle, and the little hood, with a vehemence (and a running fugue of screams) that might settle the ownership of the whole by the passionate tearing of it into bits. They are as eager, these little folks, in their strife, as if they were real big people; but one saucy young mite, by sheer strength and pertinacity, makes herself at last victorious, and escaping from the others triumphantly, curvets and dashes her prized vehicle about—concentratedly, all for her individual amusement—in a distant and safe corner of the room. And, as a companion-picture to her, there is not wanting an illustration of the opposite side of human nature. She is War and Victory, but here is Peace; here in a broken-down disused bassinette (full-sized), that has been drawn up for tidiness and convenience under a table without a cloth on it, and with light thin legs. It is no grand environment, but a small Damon and Pythias have ensconced themselves therein, and to them it might be a gondola, a Cleopatra's barge, a golden galley, they are so content with it; and in it they are living a life of love, one amicably at each end, without a note of discord. They are very lazy—which is perhaps the only way to be very serene; they are doing absolutely nothing; unless much account be taken of the mental exertion of considering themselves the aristocracy of the little assembly, and in occupation of a position that is unapproachably grand. They have a slight ruffle on their suave surface; pretenders come to dispute their tranquil holding, and they are obliged to be perpetually on the watch; but they beat all their assailants vigorously off—whether they are plump young toddlers, strong enough to return them push for push, or little whining creatures, receiving their rebuff resignedly, and walking off mutely when it has been administered to them, in search of some other melancholy joy; and they remain, as they think themselves, the true *nous autres*, the properly inheriting *crème de la crème*.

Occupying a prominent place in a public nursery is a railed-off spot some six feet square, floored with a soft wool-mattress covered with a gay

Digitized by Google

patchwork quilt. This is called, in some places, comically, the 'pound;' and in others, prettily, and in tender memory, the 'fold.' Its use is described aptly by its double name. If a robust three or four year-older be too freakish or frayful, he can be plucked out bodily from the little skirmish he is creating, and the pound can be his prison, and his mischief limited to what can be accomplished within its closely trellised pales. His small antagonists, over whom he has been tyrannising, can see his clenched fists and little fiery cheeks, but they can brave his fury, since they have but to keep their distance, and, let his rage and indignation scream his loudest—they are beyond all fear. And if a wee chubby crawler be not in its cot or its little tabled-chair, but is proceeding from one side of the room to the other on a voyage of gay discovery, and the scamperings of the big Brobdingnags are bringing peril to its Liliputian limbs, it can be put in this place of safety, which is then a fold indeed, and gives peace and shelter to a little helpless lamb. It can crow there, and make the circuit of its comfortable enclosure; and it can coo at a red piece of patchwork; and when it has confessed its love to that, be quite as confidential to a streak of lemon colour or a star of blue; and it is all the time where no harm can come to it, and where the matron can have it entirely off her mind. It is true, a Brobdingnag might rush up with a toy, and aim it at the little tender head; it is true there was a Billy with a highly developed acrobatic tendency at one of the nurseries, whose delight was to clamber over the fold-fence, and let himself out again with his head on the mattress and his legs curiously in the air; and he *might* have deposited himself plump on the tiny thing, or have used its round fat body as a convenient stepping-stone to aid him in his feat; but then Billy was an exception as an inmate; he was five years old, perhaps, and of lanky growth; and, as a rule, children are very kind to babies, and are proud to shew they can give them their protection as a shield.

It is no bad thing to take in a bag of cakes to these little ones, or a handful of penny toys. Tiny fingers clutch at a cracknel eagerly, and it is not long before it is in a moist mouth. 'Savoys' are too savoury to be kept a moment in the hand; 'Readings,' 'wines,' and slim 'ladies' fingers' tempt only too vigorously to swift and sweet dispatch; while a Scotch scone hides little eyes, and nose, and mouth, and all, and does duty, in its size and satisfaction, for a whole and seldom-equalled meal. The toys are little less contentment. The sight of them is the signal for the old ones to be instantly discarded; and when a magnificent speckled duck that squeaks finds a delighted owner, it is carried off to a cot, and put to bed, and swung and sung to with all the powers of heart and brain. A baa-lamb is a treasure; a wooden monkey, who slides his impertinent head up to the top of his own pole, and then slides right over it, and down again, is more valuable than gold; a little white-ash woman, working at a churn, and spinning complacently round an elevated pigeon-house, at the pulling of a string, is ecstasy; and monstrous cock-a-doodle-does, that are unpainted everywhere except at a very coral comb, are choice possessions indeed. Of course, cakes and toys should abound in a nursery; and so, for another thing, should good juicy fruit. It is a capital *dictum* of Herbert Spencer's that every child's diet-list should contain one absolute *meal* of fruit a day. He judges, by the evidence of a child's delight at the sight of it, and the avidity with which, when any is offered, it will hold out its hand, that Nature is clearly proved to have sent fruit as a food—as the relief of a positive necessity—and not merely as a *bonne bouche*. But if ever so much faith is pinned to such a verdict in a public nursery, it will have to end in the pinning. The funds on which they exist are too slender (even after the most earnest and insinuating begging) to find anything beyond the accommodation and the nurses; and what can be done with the small twopence that is the price for each child a day? In the largest nursery visited, there were only twenty-five children; in the smallest, there were but three—the 'takings,' consequently, do nothing. As long as the numbers of the children are so small, the institutions must continue to be charities, and much that is known to be good by the managers of them can only be thought of longingly.

This twopence mentioned as the nursery payment does not, of course, include *any* food. Food can be provided by the institutions; but then the price is double—fourpence; and a further alteration is made in the charge where there are two or more children from the same family—twopence is then reduced to three-halfpence, and fourpence to threepence; a very liberal percentage, considering numbers by no means lessen inconvenience, and it has never yet been found that, because two boys happen to be brothers, they eat a spoonful less than two boys who are no kith or kin. For this fourpence, food is given that is suitable; but where the meals are brought by the mother, they are a very sorry supply. A baby's public nursery-day lasts from seven in the morning till seven, and sometimes eight, at night. Take such a day, in a well-managed home, of a child of, say, three years old. During its twelve hours there would be given, perhaps, a breakfast of bread and milk alternated with oatmeal porridge; a dinner of meat and bread, and light farinaceous pudding; a tea, in which there would be milk again, and the coveted sugar, besides good butter, and the best of fresh-cut bread; and then there would be, most likely, a little hand filled with fruit from mamma's own plate, when the time came for a kiss and a last bye-bye. Well; what does the public-nursery child eat, to support *its* wear and tear? What fuel goes into *its* little furnace, to keep the metal at proper glow? Bread and butter! Bread and butter cut at early morning, and getting drier and drier every hour of the day—no matter whether the little spirit it is to nourish is flagged and fainting, or whether excited appetite is yearning for rich and savoury food. Ah! is it *much* wonder there should be immense mortality among infants? Is it *much* wonder the tiny dead among them should number about as two to three? Surely, the wonder would be if little soul and body *could* be kept together on such repeated diet. Surely, the wonder would be if blood could be made, and muscle strengthen, and bones solidify, with nothing more than such material to do it. Of course, the little ones pine and whimper, and are fractious or submissive, and have red eyes and watery humours, and are so pale and puny, the sight of them brings an aching to the heart. This little brother and sister through whom the thoughts of this feeding came, are very fair specimens of their class. They may be taken as a type. They are pretty-featured,

Digitized by Google

poor souls! but they are under-sized and feeble; the little arms (of the younger especially) hang loose and aimless; he is pale-eyed, pale-haired, and he utters a low complaining cry, that makes his Lupa take him on her knee and pet him, though she knows it is beef-tea, and sago-pudding, and warm clothing he is wanting, and these are all out of her power to give.

It is price, too, for the most part, that prevents public nurseries being so much used as would be good. They are not used, of course, by the wives of prosperous working-men. These know that the seven or eight shillings a week their 'bit' of ironing, or washing, or charring would bring in, are just so many shillings wasted; for they could save as much in care and management (and double or treble the amount in comfort) by staying industriously at home. The women who send their children to public nurseries are mostly widows, on whose toil their *all* depends; or they are the wives of labourers who can, at the best, earn but little, or who are weak-brained, or 'unlucky,' or indolent, and so, very frequently, have nothing to do at all. Then women *must* work. Then women *must* leave the sphere that civilisation has assigned them; and must be the bread-winners, and must also let their homes and families sink out of the rank, a whole century behind. It would be a good thing, perhaps, if, for the sake of these, public nurseries could be opened free. A ticket shewn by them of a proper day's work done, should be the sole certificate required for title to the proper care and food of a baby for the whole of the following day. There would be little likelihood of abuse. Only hard-pressed, hard-worked women would come. It is found that thoroughly sluttish slattern women never approach a nursery, for the reason, that all children must be taken to them *clean*. And it is so much easier, when they *are* going out to work, to wrap their baby in an old shawl, and pop it into the bed of a neighbour who is going to stay at home. It is an accommodation any one will return to another, for it is an accommodation that all may require in turn. And there, in a foul cluster, may the women and babes be seen; the house-steps thick with them, the windows a lazy lounge; and then cries are quieted with something not so harmless as bread and butter, and then—somehow—the city festers, and the names heard loudest are disease and crime.

Are children ever taken to a public nursery, and left there, as an easy means of riddance, without much reasonable chance of parentage being known? No; never. One Lupa (Lupa Secunda, it was) was very much alarmed once. She had two children—one three, the other five years old—for whom the mother did not come at night. She waited and waited—all the night; the next day; its night; a third day; and the night of that; a fourth day; and then, at dusk—deep dusk—she heard a step that was slow and hesitating, and a voice she knew. She looked up, and saw a head bent shamefully; and going nearer, she saw the face that looked so shy, and that kept so resolutely in the shade, was all bruised and swollen; and with the help of evasive answers given to her inquiries, she made out the whole tale. The woman had let her ire and violence run over, and had had a fight, and had been locked up. Poor little children, to be claimed by such a mother! Lupa believed, however, in her general well-doing. She dealt with the class who are given to an outburst of savageness and dissipation; and a sharp backsliding did not destroy her faith in the power of picking up again, and proceeding in the right path once more. Her belief, though, was far too good for the facts. Before the year was out, the mother was missing again; and again, with a face bruised, she returned, and equivocated, and was mute, and shuffled, to hide as much as she could of the bareness of her shame. After which, of course, the children were not allowed entrance into the nursery. Their little history was over, as far as present record is concerned.

It is not for children of such a mother as this that public nurseries exist; and, beyond doubt, they should not. Abuse is intended to be avoided by them, not fostered; and, happily, this woman presents an extreme case. Another came to one of the nurseries to give her five-weeks' old baby its mid-day meal, and she shall be cited as a favourable specimen. She was bony and haggard, poor thing; worked into the aspect of having lived half a century, though ten years might be hewn out of this, and be nearer the proper computation; but she was clean, and brisk, and tidy; and she took her babe and suckled it, and set it on her knee, and patted its little arching back; and then she kissed it, and put it back into its bassinette, and with a nod and a smile, was down the stairs and gone. She was a laundress, and had left her tub to come; and she was off to it again, and would once more leave it, to reascend the stairs, and renurse her baby, with yet another return to finish off her scrubbing, before it would be time to come finally and carry her child away. And this is how the thing works; and it would be hard to tell of any more useful, or less harmful working.

A PERFECT TREASURE.

CHAPTER XIX.—THE SUNK SHIP.

'BETTER late than never,' was the observation addressed to me by the skipper, as I came on deck; and I grumbled through my vizor such an assent as any tardy diver who has no excuse for his delay might be supposed to give. 'If Dewsnap had chanced upon the Indiaman's strong room yesterday, you would have missed your wage, young man,' added he severely.

'There, don't fash him!' exclaimed my supposed mate. 'If he was late for yesterday, he 's in time for to-day.'

At this moment, I felt what were two enormous hands laid upon me on chest and back, and began to struggle against what I thought was some practical joke, imposed upon me by way of punishment.

'Be quiet, mate,' cried Dewsnap angrily; 'and don't play the fool, now you are come.'

Then I remembered that they were but hanging about my shoulders those huge weights of lead which I had seen placed upon the diver on the previous day, to make him sink, and I determined for the future to remain silent and sullen, like one who was offended, so as to run no further risk of self-betrayal. This resolve, however, was quite unnecessary, for at this moment somebody clapped a sort of glass box over the mouthpiece of my helmet, and screwed it tightly on, so that I could neither hear nor speak. Moreover, I was almost ceasing to breathe, when the air-pump began to work, and supply me with the vital fluid. These

Digitized by Google

practical details, although thus unpleasantly forcing themselves upon my notice, were not unwelcome, for they prevented my thoughts from dwelling on the ordeal before me. Otherwise, at this supreme moment, my courage, like that of Bob Acres, might have oozed out at my finger-ends, which was the only means of egress left for it. My hands alone were in contact with the atmosphere; the rest of my person was swathed and pent in like a mummy—weighted, too, as no mummy ever was, so that, when they signed to me to approach the ladder that led beneath the sea, I stood motionless for a second, and then could hardly move one leg before the other. However, my companion, similarly accoutred, was preceding me, so that I was not much noticed. He had luckily remembered to volunteer to carry the axe, or, I am sure, with all my natural activity, I could not have made the descent at all. Besides my air-pipe, I had a string, which was to guide me to the rope-ladder, in case I lost my way in the sea; but of course it was not my intention to part from my companion for an instant.

So long as I was in the air, although I only felt it on my hands, my descent was comparatively easy; but as soon as my limbs entered the water, they began, notwithstanding I was so heavily weighted, and the sea was calm, to sway about, and to be impelled upwards in a surprising manner.—I have of late read M. Esquiros' book on English Divers, and am bound to say that the narrative of his own experience in this matter is most accurate, and in no way exaggerated; but he did not descend by some fathoms so deep as I; and although we were both favoured with calm, my adventure was in winter-time, which has never such entirely smooth seas as summer. However, the experiment is sufficiently trying to the nerves under any circumstances, and how severely so, may be guessed from my laying any stress upon such matters, who had so far more terrible things in immediate expectation. Indeed, nervously apprehensive of the latter as I was, I thought not of them for the space of a full minute, when first I got beneath the surface, and saw the sunlit water weltering above my head. The impulse, at that juncture, to return to my own native atmosphere, and become, as it were, a man again, was stronger than I can describe. Nature herself seemed battling within me against my audacious and perhaps impious project. There was a whirlpool in my brain, that only did not deafen me because I was deaf already. I had voluntarily resigned my powers of speech and hearing, and had now cut my other senses off from communication with all my kind, save that one man, himself more like a monster, who awaited me at the foot of the ladder. I could still see, although, as I descended, the light became more and more obscure, till it was little better than twilight. All, too, seemed insecure and uncertain; the rope-ladder moved as I moved, and even when I at last set my feet upon the solid sea-bottom, they were pushed this way and that way by the movement of the water. But here, to my intense relief, I found my trusty companion: he nodded his vast head, as though he were some dreadful gnome, who had been commissioned by his marine lord to bid me welcome to that weird region, and patted me approvingly on the shoulders. He could not take my hand, because I was clutching hold of the rope-ladder with all my might with both; and there he suffered me to remain for a minute or two, until I got somewhat accustomed to the situation.

I peered around, and presently things grew a little more distinct. I saw fishes swimming slowly by, not at all alarmed, but seemingly a good deal interested in our appearance. I saw the sloop above my head, and the air-tubes hanging down from it to my companion and me. I beheld the long-leaved seaweeds swaying and curling like serpents beneath my feet. Presently, I again felt a tap on my shoulder, and knew that it was time—that all I had hitherto undergone was as nothing to the experience that was about to present itself. Then the present difficulties at once began to decrease. I let go the ladder, and took one of my companion's hands, by help of which I managed to shuffle along for a few paces, when a huge dark object began to loom before us through the solid mist. It seemed to approach us like some monstrous whale, but in reality we were approaching it. It had indeed once moved through the waters swiftly enough, but it would never do so more. It seemed but a shapeless mass, so terribly had it been dealt with by wind and wave; but I knew at once that it was the Wreck.

There was a breach almost in the centre, which we ascended into with the utmost caution. The great peril of the diver's trade was now imminent. In exploring sunken ships, there is always danger of the air-tube getting twisted round something, or broken by a sudden turn. Once on what had been the deck, but what was now a mere congeries of broken planks and splinters, one could make out the parts of the vessel; the head could be distinguished from the stern at least, and in the place where the mainmast had been, stood its fractured stump. Short as was the time since the catastrophe occurred, sand had intruded itself almost everywhere. I noticed all these things mechanically, but did not give them any real attention, and almost forgot that I was under the sea at all, so overwhelming was the idea that I was about to be in the presence of the unhappy man upon whom, in his perfidy, Death had fallen unawares—although, Heaven knows, my heart had forgiven him.

'Our way lies here to the right,' signed my companion, pointing to the fore-cabin stairs.

These were not broken to pieces, like the more exposed portions of the vessel, and besides, they were edged with some metal; but the hand-rails on both sides had been torn away, perhaps by human fingers in their last agony; the skylight above was also destroyed, both wood and glass, so that, as we descended, we could see almost as distinctly as on deck. The cabin, large as it was, seemed crowded with inmates, some on the sofas, sitting tranquilly enough, poor souls! others at full length. A few were lying on the floor; and one, a woman, with a child in her arms, knelt in front of us beseechingly, as though we had come to save them. So different was all around from what I had expected, so real and lifelike, that it was not terror which seized me so much as yearning pity. There was nothing absolutely terrible about the scene, because there was nothing to remind you that all these fellow-creatures were dead. Each figure had a slight but perceptible motion of its own, produced by the moving of the water, so that it was easy to imagine they breathed. In some cases, indeed, it was only by observing that they were maintained by the same element in a position that they could not have kept in the upper air, that the truth could be

Digitized by Google

discovered. It must be remembered, too, that the general obscurity, as well as the thickness of the glass through which we beheld them, forbade any very accurate inspection, even if we had wished to use it. But my companion was as solicitous as myself to see as little as he could. He made his way along the floor, still holding my hand in his, towards the upper end of this apartment, each shrinking mechanically from those who involuntarily touched us upon our way. Then I suddenly felt my guide's finger shift from my hand to my wrist, and I knew that we had reached the thing I sought.

The Hindu was standing almost upright—the only inmate of the cabin who so stood—clutching with his nails a beam of the ceiling, above which there was a great fissure right through to the deck. Perhaps the poor wretch had taken up that position to get air, for the cabin, before the diver had broken into it, had been fast closed; or, perhaps, with some despairing hope of escape. Heaven only knows. His face was turned towards me, with the eyes wide open, but with what expression I am thankful to say I cannot tell. All the terrors that had filled my dreams and troubled my waking thoughts were as nothing to the horrors of that moment, during which, even my companion, as he afterwards told me, shut fast his eyes. Still I kept repeating to myself: 'It will be over in a moment, and it was my dear Uncle Theo's wish.' If it had not been that he had left me his express injunction, I am sure that I should have left my task unfinished even at that last moment. But I set my teeth, and gathered myself together. I reached forth my hand to the folds of the linen, in which, by way of pocket, the Hindu had always placed his portable treasures — his box of opium; his money, when he had any; and a watch, which his master had given to him. They were all there, and besides them the Sealskin Packet, to recover which I had undergone so much. My expectations had been well founded. I had reflected that he would not destroy it, nor its contents, since he was ignorant of their exact nature, and only knew that they were of value from their being kept in my uncle's secret drawer. I was only taking back my own, yet, as I did so, there seemed, to my fevered brain, to come into the dead man's face a look of reproach; and whether by my touch, or stirred by the displacement of the water by our presence, I know not, but he lost his hold of the beam, and sank slowly down upon the floor, ere I could turn my horror-stricken but fascinated gaze away.

Indeed, I know not how long I might have stood, as if riveted to that fatal spot, had not my companion griped me like a vice, and dragged me to the cabin-stairs, and this time as fast as my apparel permitted me to move. He told me afterwards that he did not expect to get me to the upper air alive. Indeed, how, in my miserably weak condition from want of food and sleep, I ever went through with the adventure at all, surprises me even now, and especially how, when I had gained the object for which I had striven so vastly beyond my strength, I did not give in at once; but thanks to my faithful guide, I somehow or other arrived at the foot of the ladder. There, hands and feet refused their office altogether, and my senses so forsook me that I even forgot the so often enjoined signal for those above to 'Haul up.' The last thing I remember was the transferring of the precious packet from my hand, in which I had hitherto tightly clasped it, to my waist-belt, after which all was blank.

CHAPTER XX.—THE SECRET.

When I first opened my eyes again, or, at all events, remember doing so, it seemed to me that I was still beneath the sea; the light about me was not that of day, and there was still a murmur in my ears like the whisper of the moaning waves. But presently the objects about me grew distinct—I was lying in a bed-chamber, that I recognised as the same in which I had slept, or tried to sleep, at Mr Glendell's. The window-curtains were closely drawn, but they could not altogether exclude the noonday sunbeams, which danced upon the wall beside me. How bright and joyous they seemed to me after that dark journey!

At a table by the fireplace sat the surgeon, apparently engaged on some accounts. It appeared strange even to myself that I was not surprised to see him, nor at my being where I was, nor interested in whatsoever might have happened to me of late. It was sufficient for me, through my half-closed eyes, to watch the sunbeams. What was nearest to me, and gave me the least trouble to observe, alone drew my attention. On the coverlet in front of me lay a white and almost transparent human hand. Did this belong, thought I, to one of those poor drowned women whom I had seen in the cabin down yonder, and whose hands were like it? At this idea I shuddered in every limb, whereby I perceived that I was looking at my own hand. It was all bone and whiteness, and little more than the shadow of its former self, yet it felt very heavy as I lifted it to my face, and felt how pointed was my chin, and placed my fingers in the hollows about my eyes and in my sunken cheeks. Then a spoon was put to my mouth, and I swallowed, though with difficulty, something warm and grateful to my palate.

The little doctor was standing by my side with a kind smile, but his finger at his lips, and I tried to smile at him in return. 'You must not speak, Marmy,' said he softly; 'you must lie quite still and quiet until you grow stronger.'

I looked at my shrunken hand, and then at him inquiringly.

'Yes, you have been very ill, my dear lad; but you will get well now. It's a long story, and you must not hear it yet.'

My eyes still asked some question, and this time eagerly, passionately; the noises in my brain began to increase.

'Quiet, quiet!' said he soothingly. 'What you are thinking of is quite safe: it is under your pillow;' and he took out the sealskin packet from where it lay, and once more placed it beneath my head.

Then, with an indescribable feeling of security and release from all earthly trouble, I fell asleep.

On my second waking, all things about me were the same; but I no longer disregarded them; my eyes took in everything that was to be seen. My thoughts had become submissive to control, and when Mr Glendell came to my bedside, he did not this time say: 'Hush,' but whispered kindly: 'What is it, Marmy?' Then I murmured 'Rosa;' and my darling came.

She sat by me for an hour, talking of her late journey to town, of my own illness, and of Mrs Blunt's solicitude on my account; but not a word

Digitized by Google

upon the subject which had monopolised my mind so long. I quite understood that the topic was forbidden until my strength returned, and dutifully acquiesced in that arrangement, the more so, because, whenever my fingers stole towards the packet, and touched it, there came again that roaring in my ears.

At last my patience was rewarded, only there was this drawback, that when Rosa began to listen to the narration of my late adventure, Mr Glendell was always in the room with us; and when I felt the colour rise ever so little in my cheeks, or a light burn in my eyes, he would interfere with: 'That will do for to-day, Marmy.' For what they were afraid of was that the fever, which had wasted me to skin and bone, and fired my brain for many a day and night, should return, like some man-eating beast, and devour the miserable remains of me. Thanks, however, to the unremitting care of my host and his sweet daughter, it did not return; and after a weary time of languor and uselessness, I was got down-stairs, and pronounced convalescent.

Then it was that I asked leave—for my word was pledged not to touch it without the surgeon's permission—to open the sealskin packet, and read what it contained to Mr Glendell and Rosa.

'And so you shall,' said the surgeon good-humouredly, 'when you have heard what the Secret is, from us. Not that we have peeped into that sacred packet of yours, believe me, for while you were alive we felt that it would be wrong to do so; but logic and sagacity supply the place of mere foolhardiness, my friend.—Yes, Rosa, you may frown; but I really cannot compliment him on that marine adventure. Mrs Eleanor Blunt and myself—for I grant she helped me considerably in the matter—did not require to put on diving apparel, and explore the bottom of the sea for a secret which we had already guessed by the help of our own wits on dry land.'

'You had already guessed?' said I in astonishment.

'Yes, before I started for London; nay, upon the very night when the wreck took place, I was in possession of the main fact which that paper will disclose. However, I must say I had some premises to go upon, which you were not possessed of. Let me begin at the beginning. On the day you went to Daisyport, not knowing how long you might be absent, I commenced the task you had intrusted to me, of setting your poor uncle's house in order. In his study I found two books—the one that Table of Annuities which he had long given over consulting; and the other, this volume upon Precious Stones. As I carelessly turned this latter over, it opened, as if from frequent use, at a certain page, which seemed to me of great significance, since every printed word of it was underlined. I compared with what I read in it the various hints dropped by its late owner to yourself and others regarding the Hindu, and felt convinced that I held the clue of the secret in my hand. When you came home that afternoon with Mr Moulden, and told me that the man we sought was somewhere on board of that ill-fated ship, I felt that there was not a moment to be lost if what I suspected were indeed the case. But I wished to *fortify* my conclusion by the opinion of another. It was impossible for me to confide in you. Even at that time, I felt apprehensive for you. I was well persuaded that you were already too much wrapped up in the very subject in question to permit of my exciting you further, and I think the event has proved that I was right.'

'Not so, Mr Glendell,' sighed I: 'if you had but told me what you guessed, I might have spared myself, it seems, that visit to the sunken ship, which you tell me, and I may well believe, has been so nearly my death-warrant.'

'Well, no, not exactly,' returned the doctor, somewhat less confidently. 'I am bound to say that that diving affair of yours was well conceived enough. If I had taken you away, for instance, to town, as I intended, we should have obtained neither secret nor'——

'Nor what?' inquired I excitedly.

'Never you mind what, at present,' replied the little doctor with an affectation of surliness.—'And don't *you* tell him, Miss Rosa, neither. Let me narrate matters my own way. Interrupt me again, and I'll order him to bed and water-gruel.—Well, on that night of storm, when you lay at our house here, I rode over—as the next morning I by accident betrayed to you—to Seaview Cottage, where Mrs Blunt and the lawyer and I laid our three heads together. What we had got to go upon was my late discovery, supplemented by all those slighter indications of the matter, which had now a new significance. You remember how your poor uncle used to call that poor unhappy Hindu *A Perfect Treasure*—how he said he would rather lose ten thousand pounds than Sangaree Tannajee; and how his true value would only be discovered after his death. Those mysterious words now became intelligible. Again, do you remember that poor whity-brown fellow's habit of patting himself in a meaning manner when angry with his master, and that that absurd action always produced its effect upon your uncle?'

'I do.'

'Well, even this became of vital importance in our investigations; as likewise a circumstance which had come under my own notice, and was apparently wholly unimportant—namely, that the Hindu had suffered dreadfully from dyspepsia, worse, even, than his habits of opium-eating and laudanum-drinking and consumption of all sorts of spirituous liquors had deserved. He was more like a man who had some foreign body within him, to which his system could not assimilate itself.'

'Oh, I think I see it!' cried I suddenly.

'The devil you do!' said the little doctor, looking about him. 'Where?'

'I mean the secret.'

'So did Mr Moulden: he expressed his opinion that it was something on the liver; and he was wrong. "To judge by the poor fellow's behaviour then," said he, "it ought to have been the spleen that was affected;" but it was not that.—"Now, Mrs Eleanor Blunt," said I, "do *you* guess; and let me see whether you are the genius I have heard you described. What was the matter with the Hindu, do you imagine, and why should his value only be discovered after death?" "Perhaps," said she, "although ugly, he bears, like the toad, a precious jewel in his"—— "Yes, in his inside, ma'am," exclaimed I. "You're right;" and I felt as if I could have hugged that sagacious woman to my breast. Fancy, Marmy; without the clue that I held, she had actually guessed the secret!'

I was about to express my doubts of this, but Rosa signed to me to be silent. She saw that her father, who was by no means a great reader,

Digitized by Google

had not understood Mrs Blunt's remark to be a quotation, and was giving her credit for an almost preternatural sagacity. Of course I remained silent; indeed, for my part, I thought it just as well that my future father-in-law (as I hoped he would be) should entertain so high a respect for one who had a genuine regard for me.

'Well, this was what was printed on the page of your uncle's book, and underlined and finger-marked, as though some constant reference had been made to it by the owner, doubtless to reassure himself, by the consideration of a parallel case, that such a thing could be'——

'But I never saw that book in my life,' interrupted I, pointing to the volume from which Mr Glendell was about to read.

'I daresay not, though your uncle looked into it often enough, I'll answer for it. It was always kept in his desk.—Now, listen to this.—"The Sancy Diamond (53½ carats) was found on the body of the Duke of Burgundy after the battle in which he was slain, and bought in 1749 by the king of Portugal. In 1789, it was sold to the Baron de Sancy, from whom it derives its name. Sancy sent it as a present to the king of France, *by the hands of a servant, who, being attacked by robbers, swallowed the stone, which, after death, was found many years afterwards in his body.*"—The light breaks in upon us now, I think,' observed the doctor exultingly. 'Even Mr Moulden guessed what had happened when we had got so far. No wonder that unfortunate Hindu was dyspeptic, and patted himself when displeased, as much as to say, if you don't put up with all my whims and tempers, I'm off with this jewel of yours, which I am carrying about with me *just here.*'

'And how do you know it was just there?' inquired I.

'Oh, well, I suppose it was,' replied Mr Glendell looking very confused. 'I am an anatomist by trade, you know, and that's the only place where he could have carried it. If it had lodged in the trachea, it would have made him much more uncomfortable.'

'But how on earth came he to swallow it at all?' mused I.

'Well, I confess that is beyond my powers to arrive at,' said the surgeon, rubbing his hands. 'I think we did pretty well, Mrs Blunt and I, in arriving at the conclusion we did, and which I'll go bail that lawyer fellow, sharp as he thinks himself, would never have hit upon. No, for that part of the story we look to you, Marmy, and to what lies under that sealskin cover.'

'But why did you not tell me this before?' said I. 'For then you would have spared me what, with all its horror, has now turned out to be a bootless errand.—By-the-bye,' said I abruptly, with as much carelessness as I could assume, though my fingers trembled so with agitation that they could scarcely retain their hold upon the packet, 'I suppose that sloop with the divers has long left the bay?'

Mr Glendell and Rosa interchanged a meaning look, as the former replied: 'Yes, indeed; weeks ago, its task was completed; the wreck broke up about three days after you visited it. The men were, however, very successful, and recovered the whole of the treasure.—You are very pale, Marmy.—Rosa, dear, leave us alone for a little, until I give you a call.'

The young girl left the room with her usual obedience, but not, I thought, without a reproachful look at her father.

Then the surgeon poured me out a glass of wine, which I swallowed greedily, and drawing his chair close to mine, he took my hand.

'I am not going to torture you any more, lad; I have got good news for you, the best of news, though Rosa does not know it. She has been telegraphing to me a dozen times not to pursue a subject which she deems must be to you one of unmitigated pain and disappointment. Of course you feel it to be so. When you asked that question as to whether the divers were still here, it was easy to see what you had got in your mind. Well, endeavour to dismiss all your anxiety, and to trust to the word of an honest man when he says "all 's well that ends well." Good. Then, if you will be kind enough to read what your poor uncle left behind him—which is no Secret now—I will finish my story afterwards. Then all things will be in their right sequence.'

I unfastened the string that was about the packet, which had still the impression of my uncle's seal upon it unbroken. Within it was a little scroll of yellow parchment, on which were written, in his handwriting, the following words:

CHUDDLEPORE, *January* 4. (Here followed a date of thirty years back.) *It is now a fortnight ago since we came in safe across the frontier from Bundelbad. We had to cut our way through Her Highness's troopers. I had intrusted Sangaree Tannajee with all my jewels, including the large diamond called Light of the Crown, which the Begum gave me on our marriage. This alone was missing. He at first said it was lost; but on my seizing him, and taxing him with the theft, he acknowledged to having swallowed it. This is to certify that that jewel is my property. I have spared the Hindu's life upon his solemn promise never to leave my service, nor marry, nor in any way to alienate this possession from myself and my heirs.*

Then followed in less pale ink a recent date, and the words: *I give and bequeath* [my poor uncle had as crude notions of will-making as I had myself] *the diamond called Light of the Crown, after the death of its present unlawful possessor, to my dear nephew, Marmaduke Drake.*

THEOPHILUS BRAYDON.

'And do you mean to say, Mr Glendell,' inquired I with a beating heart, 'that this jewel is not lost to me and mine for ever?'

'I mean to say that it is here,' exclaimed my companion triumphantly; and he produced from his pocket one of those jewellers' boxes, lined with satin, that are the cradles of all dainty jewels, and in which reposed a magnificent diamond, which he made to sparkle as he turned it this way and that way in the sun.

'Now for my part of the story,' said the doctor importantly, while I sat staring at the living gem, not certain whether I was awake or dreaming. 'The reason why I did not tell you of our discovery of your uncle's secret was simply because I thought it would have driven you mad. You had already evinced signs enough of the illness that was impending over you, and which any further anxiety of mind would have precipitated at once. If you had been told, for instance, that any day the sea might throw up on this very shore, not only the secret on which you were so passionately set, but even the wealth which your uncle had

Digitized by Google

promised you should one day possess, it would have set your very brain on fire. Even I myself was greatly excited, and at once (though I accounted otherwise for it to you) placed such a reward on the finding of the Hindu's body as would insure its being taken care of, and yet not awaken any suspicion of its great value. Then, when all hope of the bodies from the lost ship being cast ashore had failed, I strove—in hopes to avert that very calamity which afterwards befell you—to persuade you to leave the neighbourhood. At that time, of course, I knew nothing of the diving operations which were so soon to take place, but I left Hershell fully expecting to be recalled to doctor you; and so far my judgment was correct. When the summons arrived, Rosa and I at once came home, and have tended you ever since; and I may now say that you have had the very narrowest shave. But there, you are getting on famously now, thank Heaven; so we 'll say no more of that.'

I squeezed the good surgeon's hand, for well I knew that I had to thank him, next to Heaven, for my life.

'We heard, of course,' continued Mr Glendell, 'of your foolhardy expedition, Marmy, into Davy's Locker; and, indeed your companion the diver told us all about it himself. You could not have had a more anxious inquirer during your illness than he; while the way in which he eulogised what he called your "pluck" was forcible beyond my power to render. It was to this true friend of yours that I confided that it was most important to your interests that the body of the Hindu should be recovered from the wreck; and although he refused to oblige me in that respect himself, on account of some superstitious scruple which he entertained against meddling with the drowned, he got his mate (who had arrived in the meantime on board the sloop) to undertake the matter, for a consideration, ample indeed, yet not one-half per cent. of your gain. To him and the rest we gave out, as before, that you wished to place the Hindu's remains beside those of his master. And, eventually, this was done. Only you see, Marmy'—and here the surgeon winked in a very sagacious manner—'I did not feel quite satisfied in my mind as *to the cause of death*. I am the last man in my profession to approve of anything like body-snatching; but the scientific investigation of physical phenomena is quite another thing.—Well, I see you do not sympathise with my views, though I do assure you the case was of the greatest and most peculiar interest, quite independent of —— There, there; take another glass of wine.—Well, *I got the diamond;* and nobody is any the wiser.'

'What! Do you mean to say that nobody knows of it?'

'Hush! Not a soul—of course not. I had no sort of business to anatomise the poor fellow, and I should get into a most unpleasant row if it were discovered. It was for your sake, my young friend, remember; so you must keep it quiet too.'

'Yes, indeed,' said I warmly; 'and I shall never forget the obligation.—But do you mean to say that you have said nothing of my good-fortune even to Rosa?'

The surgeon looked very grave. 'No, Marmaduke; I have not. This diamond of yours is very, very valuable. When your uncle hinted he would not lose it for ten thousand pounds, he did not exaggerate its worth. Those accounts over which you saw me poring the other day were the estimates of the different jewellers to whom it was submitted for valuation, for I thought I would save you all that trouble.'

'But not to tell dear Rosa!' reiterated I—'that seems so cruel.'

'Well, you see, Marmy,' said the doctor hesitatingly, 'I like you much, and have always had a good opinion of you; but circumstances have great power, and often change folk's views. To a poor man, as you used to be, a match with my daughter might have seemed to you an agreeable prospect enough; but now that you are a man of fortune'——

'Mr Glendell,' cried I reproachfully, as I strove to rise from my chair, but fell back again through utter weakness, 'you surely never thought that of me?'

'No, Marmy,' said he kindly; 'I did not think it: but still such a change was within the bounds of possibility, and I did not wish Rosa to—to perhaps suffer a disappointment. We might have made up a little story together, and contrived a separation, and a coldness, and gradually disentangled her affections (which are more closely knit in you, Marmy, as I have found since your illness, than I had the least idea of); but to know that you had become rich, and therefore deserted her, would, I verily believe, have broken my darling's heart.—There, now; don't excite yourself; I see you are far from strong yet; and I 'll just send you in something nice and comforting to soothe you.'

Then, as I sat alone in a golden haze of wonder, yet full of bliss and gratitude, the good doctor brought me in the prescription very neatly made up, and looking very likely to do me good—for it was Rosa herself.

CHAPTER XXI.—LAST WORDS.

After the maiden of our love is won, the remainder of life is said to be a bathos. If it had been so with us, Fate would have dealt hard measure indeed, since we were, even yet, scarcely more than boy and girl. But, indeed, life had but just begun. I can truly say, that bright as my boyhood was, my manhood was brighter still, since Rosa shone upon it. As years went on, Hershell Point was no longer lonely, but echoed to the laugh of those little ones, without whom to lisp in our glad ears the name of Father, existence is indeed incomplete. Mrs Eleanor Blunt was godmother to our first-born—Theo; but the number of her days was almost filled. She did not live long enough to allow of his loving her for her own sake; although I trust he cherishes the memory of her who was so excellent a friend to both his parents. When she departed, I obeyed her wish, that I should see the world; and although we always spend the summer at the Point, in the winter we live in the Great Babylon. I have made many ventures in literature since the days of *Brigadoon*, and, without much fear of the charge of self-conceit, I may add more fortunate ones; but no other has ever filled me with half the pride and joy of that first essay. I look back upon the period of my existence when all my world was not more numerous than Noah's, as upon another life, a previous state of being, from which my present days stand wholly apart, except for that unseen bridge which Memory builds up out

Digitized by Google

of Love, and Gratitude, and Regret, to stand all shocks of Time. What a little round of life it was, and yet how perfect! The circle has expanded widely enough since then, and yet I move less freely. As for the romance of the world, I have had my share of what is called such; but for excitement, and anxiety, and peril, nothing I have since experienced has approached that great adventure of my early manhood, when I went down beneath the sea to pluck the secret from a dead man's breast, and found him in truth what well-beloved Uncle Theo had always said he was, A PERFECT TREASURE.

THE END.

'WALRUS-SIA.'

WHEN the United States' government decided on the purchase of that distant and little-known portion of the earth—then called Russian America, but henceforth to be known as 'Alaska'—the resolution was strongly opposed by political dissentients, severely criticised by outsiders, and largely quizzed by the humorous people who have a surprising faculty for the conferring of apt nicknames warranted *to stick*. Mr Seward, with whom the speculation originated, was vehemently vituperated by serious, and extensively ridiculed by comic opinion; expensively ridiculed, too, as the wags actually inserted advertisements in the daily papers in all the great cities, offering the highest price for 'waste lands and worn-out colonies,' for 'submerged and undiscovered islands' (the Irish element is strong in American journalism, both in jest and in earnest), for icebergs, polar bears, volcanoes, and earthquakes, 'provided they should not shake the confidence of the State Department.' People exploded their fury and poked their fun at the acquisition made by the Great Republic; it was made a party question in Congress, and the territory was described by the one party as an Elysian field, not at all cold, only 'bracing;' and by the other, as a dismal Dantesque realm of desolation, and wittily entitled 'Walrus-sia.' The truth was, that nobody in America, or here, knew anything at all about it; the play of imagination on both sides was perfectly unfettered and legitimate, and we should have remained as ignorant up to this moment, had not Mr Whymper accompanied the subsequently abandoned Telegraph Expedition from Vancouver's Island, and recorded his experiences of the far north in a very charming volume.* This book is interesting in a double point of view—as affording us reliable data on which to estimate the chances of the United States making an exceedingly good thing out of Mr Seward's 'sporting' speculation, and giving us a picture of travel in an entirely new region. There may be persons who do not enjoy such a book; it may be 'no treat' to them, but to such people we have nothing to say, beyond applying to them the archbishop's valediction to Gil Blas: 'We wish you all sorts of prosperity and better taste.' Some may be found to maintain that there is no real novelty in the theme, that one frozen river is much the same as another, and that one set of skin-clad savages offer no distinctive features, beyond, perhaps, a greater facility in procuring, and a more unbounded stomach for devouring, blubber, than their brethren of the frigid zone. Such people are totally mistaken, and they have only to read, to recognise their error. Mr Whymper's book is not at all like other books recording arctic travel; the Yukon is an unparalleled river, and the tribes which are scattered about the awe-inspiring region far beyond Siberia—far beyond the extreme outposts of Russian civilisation, in a clime to which Archangel represents itself as the sunny south—have many distinguishing traits and customs. They are not like Hall's Esquimaux, though their actual lives are nearly as rigorous; and the perusal of Mr Whymper's researches among them leaves by no means the same sense of wondering sadness as that created by the narrative of the enthusiastic American explorer. Much of the difference between the kinds of impression made by two narratives which necessarily have many characteristics in common, arises from the sense, that in the one instance there is a great deal to be done, much money to be made, many of the boldest enterprises of civilisation to be undertaken, and that there are men ready to do these things; while in the other, there is awful isolation, and hopeless barrenness. None will go to the country of the Innuit, and they will die out, and leave no sign; but the land in the midst of which lies, in a yearly trance, an icebound sleep, the magnificent Yukon, for a course of two thousand miles, is continental, *exploitable*, and about to be made the most of.

The romance and enterprise of the expedition would make it delightful to think about, even if one did not care to know what are the advantages which the United States are likely to reap from a 'deal' which is regarded by many as preliminary to an American occupation of the entire continent. Candid minds, who do not adopt the 'every schoolboy' jargon of assuming that everybody knows everything about the most unlikely subjects, will ask: How do you get to Alaska? and what is it like, when you do get there? Mr Whymper is very lucid on these points, but the impression he creates at the first, is, familiarly put, that you 'get there' (on the map) by going as far north as you have ever imagined, and then a great deal further. The expedition went from Vancouver's Island, but, in reading the book with a map, it is more comprehensible to take the overland route through Russia, and begin, as the real interest of his book begins, at Sitka, or New Archangel, the capital of Alaska, the most northern harbour on the Pacific shores of America.

Concerning the interior of the desolate region to which they were bound, only the traders of the Russian-American Fur Company had any information, and they had not imparted it. Zagoskin, of the Russian navy, had explored it indeed, and written about it, but in Russ; and a German translation of his work, though made, was never printed. No doubt the present possessors of this grim domain of the north will have it thoroughly investigated. The expedition commenced its tortuous voyage among the islands, sailing from Sitka, in June, for Behring's Sea. With their arrival in Plower Bay, the absolutely novel interest of the narrative begins, and we are immediately introduced to the Tchuktchis, a tribe who live on a little 'spit' of utterly barren land, in tents ingeniously constructed of skins, stretched on roofs

* *Travel and Adventure in the Territory of Alaska, formerly Russian America—now ceded to the United States—and in various other parts of the North Pacific.* By Frederick Whymper. London: Murray.

and walls formed of the large bones of whales and walrus. These people, who are amazingly strong—it is a common thing for one of them to carry unaided a ship-carpenter's chest weighing two hundred pounds—are exposed to the most frightful cold and wind, yet there they live, never seeking the mainland. They live by fishing, and on the fish they take; wood they have none; blubber-lamps are their only fire and light. Their canoes are made of skins stretched on bones, like their houses. They are a good-humoured people, who sew their children up in reindeer-skin clothing, so that they look like walking bags, and tumble about with the utmost impunity. 'It is said,' writes our author, with commendable caution, 'that the Tchuktchis murder the old and feeble, but only with the victims' consent! They do not indulge in any unnecessary cruelty, but stupefy the aged sacrifice before letting a vein, by putting some substance up the nostrils.' This interesting trait of manners was imparted to Mr Whymper by one 'Nan-kum,' an unusually sharp and original 'native' of those parts. This personage, being taken into the engine-room of the steamer *Wright*, exhibited much intelligent curiosity, examined machinery closely, shook his head, and said solemnly: 'Too muchee wheel, makee man too muchee think.' How many civilised visitors to exhibitions of machinery have been of Nan-kum's opinion!

At Norton's Sound, the expedition made its first winter-camp, and the preparations for the sleigh-journey to the far interior were begun. These included the selection of sledges, dogs, harness, and skin-clothing, and the division of stores. Late in October, they started, by the shortest known route from the coast, to the Yukon river. A wondrous feeling it must have been, when the little party were fairly off, and the unknown, unmapped tracts of the great north lay before them, the snow-clad solitudes, and the glorious Northern Lights. The tone of Mr Whymper's narrative is that of exhilaration throughout; he responds with the readiness of the artistic temperament to the inspiriting influence of the temperature, and the wildness and daring of the journey, and one never has a chance of sympathetic shivering in reading his book. He makes light even of the snow-shoes, which are five feet long, and are occasionally used in an extemporary fashion as sledges, but which must be horribly fatiguing and troublesome. They had one hundred and seventy miles to go, and all started in good heart and 'form.' The dogs, always interesting in such narratives, were not satisfactory, in, so to speak, a moral point of view. They had too much of the wolf in them, and though they *did* their work, and not badly, they did not like it, or make friends with their masters. The party comprised nine persons, and their 'track' was the frozen surface of the Umlachleet river. They travelled all day, and slept at night on beds of firbrush made on the ice, closely packed together, and covered by a large deerskin robe. In two days they came to an Indian summer village, where they found curious underground dwellings, and harmless, kind people, very dirty, and good-natured, with whom they 'traded' away small articles in cutlery for food for the party and their dogs. Feeding the dogs is the most serious and frequent difficulty in these laborious journeys. It is impossible to carry large quantities of provisions; and if the villages are not reached in time to prevent the animals becoming unmanageable from hunger, or are found destitute of the dried fish used or feeding them, the dogs desert, after eating everything within their reach, including their own harness.

Mr Whymper gives the Indian tribes, the Makalute and Co-Yukon people, a singularly good character for honesty, in which they are truly admirable, when the rigorous conditions of their own lives are duly considered. 'On leaving Versola Sofka,' he says, 'we found the loads too great for our dogs, and raised an erection of poles, in which we deposited some bags. I may here say once for all, that our men often left goods, consisting of tea, flour, molasses, bacon, and all kinds of miscellaneous items, scattered in this way over the country, and that they remained untouched by the Indians, who frequently travelled past them.' One naturally looks for some record of physical suffering from cold during this journey, but finds it only on one occasion, which gives rise to some curious and unexpected information respecting the climate. 'Our coldest day occurred in December, when the thermometer fell to *ninety degrees below freezing*. But the weather was lovely, no wind blew or snow fell, and we did not feel the cold so much as at other times. The effect on the stores in our magazine was a very interesting study: our dried apples were a mass of rock, and had to be smashed up with an axe; our molasses formed a thick black paste; and no knife we had would cut a slice of ham from the bone.' This was long after they had reached the Yukon, and 'made things comfortable' for coming and going on their exploring trips.

Their first sight of the great river of the desolate north was after this wise. 'About noon, from a slight eminence, we could see a faint streak of blue over the trees; we travelled hard to reach it, and at sundown broke from the woods, shot down a steep bank, and stood on an immense snow-clad field of ice—the mighty Yukon! Hardly a patch of clear ice was to be seen; all was covered by a wintry mantle. Let the reader think of a river two thousand miles long, and, anywhere on this part of its course, from one to four or five miles wide, one unbroken mass of snow-covered ice, from its source to its mouth, and he will then have pictured to himself the Yukon in winter. I had been prepared to see a large stream, but had formed no conception of the reality. Neither pen nor pencil can give any idea of the dreary grandeur, the vast monotony, or the unlimited expanse we saw before us.'

At Nulato, the expedition established its head-quarters, and found life very pleasant, especially when the fish-traps set in the ice were well supplied with the fine fish of the great river. It is a strange kind of life to contemplate, especially when we remember how large a portion of it was passed in darkness.

On the 21st December, the sun rose at 10.40 A.M., and set soon after 12.30 P.M. How many Englishmen have seen that sight, or its converse, when, on the 21st June, the sun set a few minutes after 11, and rose at a quarter to 12? 'How near we were to the arctic circle,' says Mr Whymper, 'I leave to those who understand the subject; suffice it to say the sun was absent from our gaze not over forty-five minutes.' Christmas-day in the midst of the awful ice-kingdom was observed with as much propriety as possible, and with quite an extraordinary amount of jollity; and on the 27th

Digitized by Google

they beheld a sight so wonderful, so beautiful, that to read of it makes one feel that the journey would have been worth making, had it only resulted in that one spectacle of the sublimity of the heavens. 'Just as we were turning in for the night, a fine auroral display in the north-west was announced, and we all rushed out to witness it. It was not the conventional arch, but a graceful, undulating, ever-changing "snake" of electric light; evanescent colours, pale as those of a lunar rainbow, ever and again flitting through it; and long streamers and scintillations moving upwards to the bright stars, which distinctly shone through its hazy, ethereal form.'

The country is very thinly inhabited; but the natives are harmless and intelligent, and have been hitherto so sparingly exposed to the contamination of the white man, that they are infinitely less vicious and more healthy than any of the coast tribes. They have some old customs, but they are not revolting. They do not inter the dead, but put them in oblong boxes, raised on posts, and decorated with strips of skin; in fact, into four-post coffins. They have certain superstitions with regard to the bones of animals, which they will neither throw in the fire nor to the dogs. When they saw the strangers careless in such matters, they said it would prevent them from catching or shooting successfully. Also, they will not throw away their hair or nails, just cut short, but save them, sometimes hanging them in packages to the trees. The expedition made numerous and extensive explorations, and had planned out a large extent of the telegraph route, when they learned the successful laying of the Atlantic cable, and subsequent abandonment of the telegraph scheme; intelligence which they naturally received with much vexation. They came in contact with many of the tribes who thinly populate the semi-mystical land of the far north, and found them uniformly kind, harmless, and pathetically absurd. The Fur Companies trade with all these tribes, of whom the original mountain-men are the most primitive. An active English missionary, Mr Macdonald, is labouring hard among them, and with good hope of success, if he can but keep them from contact with his countrymen.

The summer comes suddenly in this wonderful region, and when it came the explorers navigated the river in their birch canoes, seeing much that was beautiful, curious, and interesting, and experiencing on one occasion the very odd sensation—*a shock of earthquake on the water!* During these expeditions, the Indians who accompanied them frequently killed the moose-deer in the river. Monotony pervaded the commissariat department. They had nothing but boiled moose-meat to eat, and they got very tired of it. The members of the expedition enjoyed excellent health. They had broken up into parties, and gone different ways, the nine among whom Mr Whymper was included keeping together; and when they all met and encamped at Plower Bay, while waiting for the arrival of the ship in which they were to embark, they mustered a hundred and twenty men, who had wintered at places as widely apart as the Anadyr, Plower Bay itself, and Russian America. Of those who had encountered the hardships of that arctic clime, only one had died; while another, captivated by the charms of some lovely squaw, had determined to remain—a voluntary exile in Eastern Siberia!

No less interesting is the narrative of the telegraph explorations on the Asiatic side of this boundless and desolate territory, in the course of which negotiations were carried on with the Tunguse, a very superior and crafty tribe, and all the locomotion and baggage-carrying was done by means of the reindeer. Riding a reindeer sounds very ludicrous, and the effect is heightened by the author's grave remark that it requires considerable dexterity to mount a reindeer without the assistance of stirrups! It is earnestly to be hoped that one of the gentlemen engaged in the Asiatic exploration will give us as much information as Mr Whymper has afforded us, and do it as pleasantly.

That the extreme northern division of its newly acquired territory may remain permanently valueless to the United States' government, Mr Whymper regards as possible; but that, on the whole, Russian America is well worth having, he entertains no doubt whatever.

RATHER AN ADVENTURE—FOR AN UNDERGRADUATE.

'For Heaven's sake, take me over!'

So cried a pale panting man to William Egerton, who was sculling easily down the reedy river Cam. Egerton looked up in the direction of the cry, and saw a sight which gave him a shock, and made him 'hold up' his boat immediately. The man who had called out so piteously clambered down the bank to the very edge of the water, where he stood with blood pouring from his nose, his face like that of a ghost, his dress disordered, his neckerchief awry, his hat pressed tightly over his head, his long hair hanging about like a bundle of snakes, and his hands clasped imploringly before him as he repeated his cry: 'For Heaven's sake, sir, take me over! Do, for Heaven's sake, put me across!'

'Why can't you go over the ferry?' asked Egerton discontentedly. 'This isn't a ferry-boat.'

'For Heaven's sake, put me across!' repeated the man, stretching out his hands as if to catch hold of Egerton's boat. 'Do put me across—the devils are after me!'

'What devils?' asked Egerton.

'The bailiffs—the bailiffs! Oh, put me across!'

'I doubt whether my boat will hold both of us,' grumbled Egerton. 'Here, catch the end of my scull, and pull the boat in. Gently, gently, or you'll capsize me.'

For the man had eagerly seized the scull, and very nearly upset the boat, which, though it was not canvas-covered, and though it was called at Cambridge a tub, was in reality a very light skiff, such as many a mother would think it dangerous for her darling son to trust himself in alone. However, the miserable man was able, and apparently delighted to get into even so frail a craft.

Egerton pushed off very carefully, and just as he had dipped his sculls for the first stroke, he heard a hoarse, dull, confused roaring in the distance, and the wretched passenger cried: 'Quicker—quicker; they're a-coming: can't ye hear 'em?'

Egerton was on the point of making an angry rejoinder, for he didn't at all like the man's tone; but young men of twenty sympathise with those who are escaping from the bailiffs, and he merely replied coolly: 'All right, my friend; as soon as I get settled to my work, I'll take you across like a shot. I don't know whether you care about your

Digitized by Google

trousers and things, but the blood from your nose is dropping all over them.'

The man only shook his head carelessly, and kept his eyes fixed on the opposite bank.

Egerton gave way with a will, and as he had to steer for himself, he was obliged occasionally to turn his head to see where he was going. Once as he faced about again, and looked towards his passenger, he saw the latter watching a number of circles in the water astern of the boat. As the passenger twisted his head back to its former position, the boat gave a lurch, and Egerton said angrily: 'You'd better sit still, my friend; what the deuce were you looking at?'

'Nothing.'

'You were looking at something, I'm sure, for I saw the circles in the water myself; I suppose a fish jumped.'

'Yes, that were it, master,' said the passenger dreamily; 'a fish jumped—I see it.'

By this time they had reached the opposite bank, for the Cam is a narrow river; and the man, having got ashore, ran up the steep path which led down to the river as fast as his legs would carry him, without speaking a word or looking behind him.

'Well,' thought Egerton, as he pulled away, 'he might have said "Thank'ee" at anyrate; but I suppose he is in too great a funk to be civil.'

As he rowed along leisurely towards the favourite inn on the river's bank, he heard the voices of the pursuers getting plainer and plainer as they came nearer and nearer, and it sounded as if they were shouting 'Murder! murder!' He laughed as he thought of the dodge the bailiffs must have used to get a crowd to assist them in the pursuit of a poor runaway, whose only crime was probably shortness of work, which was necessarily followed by arrears of rent; and he chuckled as he thought of the start he must have helped the fugitive to get; for the bridge was half a mile off, and the nearest ferry was close at hand certainly, but had nobody in attendance, as the young gentlemen at college, who were the chief patrons of the ferries, were nearly all of them away for the long vacation. Egerton was one of the few still left at Cambridge, where he was supposed to be reading for his next examination. He could now distinctly hear voices calling upon him to stop, but he only quickened his stroke, and knew he should be at *The Plough* almost as soon as any of them could get across to the towing-path, which was on the other side of the river, and which was by far the nearest way for foot-passengers. At the inn he would undoubtedly find other boats like his own, and who should say in which the fugitive debtor had been helped across the river? Besides, the bailiffs couldn't do anything—beyond abusing him, if they cared or dared to abuse him—even if they knew to whom they owed the spoiling of the chase. So he 'spurted' cheerfully down to *The Plough*, put up his boat amongst several others like his own, and sauntered into the smoking-room, where he was soon engaged in a game of bagatelle with one of the many young gentlemen who were there, and who were supposed, as he was, to be spending their vacation at the University for the purpose of studying ancient languages or mathematics. He was not half through his first game when there was heard from the towing-path a tremendous shouting, and a hoarse cry of 'Boat! boat!'

He rushed out with the rest, and stood on the lawn whilst a boat went across to the towing-path and brought over about a dozen persons, among whom there were two men who evidently were in authority, for they ordered the rest about in a high and mighty manner, and one of the two, turning to the lad in charge of the moored skiffs, asked with the air of one who had a right to ask: 'Which of these boats came in last, pray?'

The boat-keeper without hesitation pointed to Egerton's.

'And which of you young gentlemen,' continued the questioner, 'rowed down in this boat?'

He was answered by a careless laugh from the knot of young men in flannel garments and straw hats, and by a scornful inquiry: 'What the dickens has it to do with you?'

The two men who assumed so much authority consulted together in a whisper, carefully examined Egerton's boat, and then one of them having apparently taken the measure of the young oarsmen, said civilly: 'If you young gentlemen will come with us into a private room, I think I can make it plain to you what the dickens it *has* to do with us.'

The young oarsmen interchanged looks of inquiry; and when Egerton exclaimed: 'Oh! come along; let us hear what they have to say,' a general move was made towards the inn; and the two men in authority and the young oarsmen locked themselves in a private room, everybody else being left outside.

One of the two men immediately opened the proceedings by saying in a severe tone of voice: 'This is a very serious business, gentlemen. I hold a warrant for the apprehension of a man, and here is the warrant. We tracked the man; found out the house where he was, and we had almost reached his hiding-place, when somehow or other he got wind of it, and bolted towards the river. He had a goodish start of us, though he did come down a cropper (and hurt himself, I should say) jumping a low wall; but we kept him in sight all across the common, and we saw him landed on the other side of the river by somebody in one of these skiffs you young gentlemen use, and dressed, as far as we could see, exactly as you are dressed. If it was one of you, we depend on you to tell us which it was.'

There was a short silence, and then one of the young oarsmen asked: 'What had the man been doing?'

'He is suspected,' answered the officer solemnly, 'of doing murder.'

There was a start and exclamation of horror amongst the young oarsmen, and all eyes were turned expectantly towards Egerton, who, pale as a sheet, and horror-stricken at the notion of having aided a murderer, could scarcely find voice enough to say: '*I* put him across: he said the bailiffs were after him.'

'I daresay he did,' remarked the officer drily; 'and now you have thrown us off the scent. I suppose you didn't see which way he went?'

'I couldn't,' answered Egerton disconsolately; 'he was hidden directly by the wood; and when he got to the top of the cart-lane, there were five roads for him to choose from.'

'Exactly,' rejoined the officer bitterly. 'I knew that: and the people were knocked up, and my mate and I couldn't go all five ways. You've made a pretty mess, young gentleman.'

Digitized by Google

'Is there nothing I can do?' asked Egerton anxiously.

'Should you know the man again?' inquired the officer.

'Anywhere and in any disguise, I think,' answered Egerton, 'for I watched him carefully all the time I sat opposite to him, and I noticed amongst other things that he had lost two front teeth, and that he had an anchor tattooed on his left wrist.'

'Did he throw anything into the river?' asked the officer.

Egerton started, as a sudden recollection flashed across him, and he replied: 'I didn't see him drop anything in the river, but I remember well that he nearly capsized the boat by suddenly turning round and back again, and that afterwards I saw several circles in the water, as if a fish had jumped, or something had been dropped in the river. He said a fish had jumped, but your question makes me think it was not so.'

'Could you point out the spot?' inquired the officer.

'Yes,' answered Egerton, 'within a yard or so.'

'And now, sir,' continued the officer, 'I must ask for your name and address.'

Both were readily given, and taken down.

The two officers then muttering discontentedly that they had 'lost time enough already,' prepared to depart. Egerton went part of the way with them, and by earnest entreaty obtained from the principal, Sergeant Gumps, a promise that they would let him know from time to time how they succeeded in their search.

The river was dragged, under proper superintendence, at the spot indicated by Egerton, and amongst many strange articles fished up, there was a life-preserver, which was taken possession of by the authorities.

Egerton grew so restless and sleepless with thinking of what he had done, that when a week had elapsed, during which he had received no satisfactory intelligence, he determined to set out for Y——, from which seaport Sergeant Gumps had dated his last letter. He went to the lodgings of the sergeant, who was evidently very pleased to see him.

'How *are* you, Mr Egerton?' exclaimed the sergeant cheerfully. 'I am delighted to see you, sir; you 've come in the nick of time. I was just going to write to you, to ask you if you could make it convenient to come over here. There 's news to tell you, sir.'

'Well,' said Egerton, 'come over to my hotel in half-an-hour and dine with me, and then you can tell me all about it. I 'm staying at *The Albion*.'

'I 'll be there, sir, without fail,' said the sergeant.

He was as good as his word; and when the meats of *The Albion* had been removed, and the wines of *The Albion* were sparkling on the table between him and Egerton, he unfolded his tale and emptied his glass at his leisure.

'I 'll begin at the beginning, sir,' he said. 'Of course you recollect that about a month ago there was a story in the papers about a man that kept a pike in Suffolk. The man had living with him his wife, and his wife's mother, an old woman over seventy. One evening, the man and his wife went out to a merry-making, some miles off, leaving the old woman to take the pike-money and open the gate, and all that. They 'd done the same thing often enough before, and no harm came of it, as most of the people that went backwards and forwards on that road were friendly with the pike-keeper, and his wife and her mother; and many of the foot-passengers used to go into the toll-house, and sit a bit, and have a talk. Amongst these was a tramp called Jack Andrews. Nobody knew any harm of him: he was a handy chap, and was always tramping about the country doing odd jobs here and there. Well, the very evening the pike-man and his wife went out to the merry-making, Jack Andrews happened to go into the toll-house, and heard them talking about it, and saying they shouldn't be home very likely before morning. Well, they didn't get home until one in the morning, and when they got home they found the door of the toll-house open, and when they went in they saw the poor old woman dead on the ground, with her skull beaten in; and the money that was ready for the collector, who was expected to call next day, was gone. It was a tidy sum, and all in coin. There was an inquest, of course; and it came out in evidence that Jack Andrews had known about the money and where it was put; and a stranger, who drove through the toll-gate between twelve at night and one, when there was generally little or no traffic on that road, said the gate was opened to him by a man, who, by the description, must have been Jack Andrews, though he ought by that time to have been a good six hours' tramp away from the place. The verdict was an open one; you know what that is, sir: "Murder against some person or persons unknown." However, I got a warrant for the apprehension of Jack Andrews.

'I never saw him, and I don't know anything more of him by sight than the glimpse I got as we chevied him (for I 've no doubt, from my information, it *was* him) the other day, when you came and spoiled the business (excuse me, sir) with your boat. From inquiries we have made, we 've every reason to believe that the man you took over in your boat is now in this town, and thinks he is going to sail the day after to-morrow for Australia. But *I* think we shall spoil his little game. If you can swear he is the man you put across the river, *I* can swear the man you put across is the man we chased; and I have evidence to prove that the man we chased is Jack Andrews. Whether he committed the murder or not, is another question. The man I speak of goes every night to a public-house in this town: I keep it well watched, and I 've sufficient force at hand for all emergencies. If you 've no objection, we 'll go to-night, where you can see him without being seen yourself, and I can then decide what is to be done.'

'I 'll go at once, if you like,' cried Egerton, springing up excitedly.

'It ain't time yet, sir,' said the officer, looking coolly at his watch; 'it isn't nine o'clock yet, and our man seldom goes to the public before ten, and never leaves until it closes.'

So coffee and cigars were enjoyed; and afterwards, Egerton and the officer sauntered to *The Angler*. A nod of understanding was exchanged between the officer and the barmaid, and Egerton and the former were admitted within the bar, from which, through a little circular window, they could command a full view of the taproom and its occupants.

The officer arranged matters so that he and Egerton could, by changing places, see every part of the taproom without being themselves seen; and he cautioned Egerton simply to watch and

Digitized by Google

observe, and not to make any remark about what he saw.

He himself narrowly scanned his companion's behaviour, and smiled grimly when he once saw him half-rise from his chair, open his mouth, and point with his finger, and then sink down again, and shake his head as if he had made a mistake.

This was enough for Sergeant Gumps, who proposed just one more glass of grog and then departure.

Egerton agreed, and as he sipped his grog, looked ever and anon in a certain direction. At last he sprang up, with a cry upon his lips; but the other pulled him down, and made signals for silence. After a few compliments to the barmaid, Sergeant Gumps (who had, of course, been all this time in plain clothes) suggested that it was time to go. Egerton assented; and as the two strolled towards Egerton's hotel, the sergeant and he were full of question and answer.

'Well, sir,' said the sergeant, 'did you see anything or anybody in particular?'

'Well,' answered Egerton, 'I saw an awful lot of ruffians, and the worst to look at was a brute with a knobby stick in his hand, and a patch over one eye.'

'Ha, ha!' laughed the sergeant; 'that was one of my mates. He *does* make up beautiful; he's been taken on suspicion himself.'

'I don't wonder at it,' growled Egerton; 'but I didn't see the man we were looking for.'

'Are you sure?' asked the sergeant slily. 'What made you jump up, and nearly cry out, eh?'

'Because I fancied I *did* see him,' answered Egerton; 'but, though I thought I could swear to the man's general look and expression, it couldn't have been he.'

'Why not?' inquired the sergeant. 'I rather believe in general expression myself.'

'Why, the man I rowed over the river was a white-faced man, whereas this was as brown as'——

'A great deal can be done with walnut-juice,' interrupted the sergeant quietly.

'The man I rowed over the river,' said Egerton, 'had long snake-like hair, whereas this man's hair was'——

'There are plenty of barbers,' interrupted the sergeant again, 'who can cut and dye, and do all sorts of things to the hair.'

'The man I rowed over the river,' continued Egerton angrily, 'had lost two front teeth, and had an anchor tattooed on his left wrist, whereas this had all his front teeth to shew, and'——

'A great piece of sticking-plaster on his left wrist,' once more interrupted the sergeant: 'you didn't see that, Mr Egerton, did you?—I did, sir; and let me tell you, I have heard of a dentist in this town who lately put in two front teeth for a common-looking man.'

'I was going to say I couldn't get a good look at his left wrist,' said Egerton pettishly, 'but you interrupted me.'

'I beg your pardon, sir,' rejoined the sergeant.

'Then you think,' said Egerton snappishly, 'the man I was so much struck with was *the* man?'

'Oh, I don't think anything at all about it, sir,' said the sergeant. 'All I want to know is, whether you saw anybody you could swear to as being, or being very like, the man you rowed over the Cam.'

Egerton was silent for a moment or two, and then he said: 'It would be a frightful thing to take the wrong man.'

'Certainly,' assented the sergeant.

'And to-morrow is the last chance?' asked Egerton with vexation.

'You heard him say yourself, sir,' answered the sergeant in a tone of remonstrance, 'that he would give his farewell supper to his mates to-morrow night, and start the next morning for Australia.'

Egerton reflected a little, and then said in a determined voice: 'Look here, Sergeant Gumps; I will go into *The Angler* to-morrow night, and into the taproom at the time this man gives his supper, and I warrant I'll find out whether he is or is not the man I rowed across the Cam.—What do you say to that?'

'It will be a dangerous job, sir,' answered the sergeant quietly. 'It's a desperate set of villains he is going to stand supper to; but he has invited my mate, who, of course, will be on your side, and I shall be in the bar, and there'll be several more of us within hail; so I think, if you don't mind walking into the taproom when supper's over, and grog is on, you might make things tolerably certain. If it *is* the man I think, *he'll* know *you*, and shew it, whether you can recognise him or not.'

'Very well; I'll be there at ten o'clock,' said Egerton; 'and you may depend upon it I'll find out whether it is our man or not.'

The next night, at a little before ten, Egerton walked into the taproom at *The Angler*. The man he wanted to see was there, ladling out punch to five as ugly-looking ruffians (including the police-officer) as Egerton had ever seen. There were two or three other customers scattered singly about the room.

As Egerton, who had put on his boating-clothes, not only as being best suited to the place he intended to visit, but also as being most likely to lead to his early recognition by the man he had rowed over the Cam, entered the room, he heard one of the punch-drinkers say: 'Friends, a toast. I ain't much of a chap to jaw, so I'll give it short and sweet—"Luck to Bob Jeffreys, the giver o' the feast, and may he have a good time in Australia."'

The toast was duly honoured; and as the man called Bob Jeffreys prepared to return thanks, and looked about him in search of ideas, he caught Egerton's eye, dropped his lower jaw, and stared with all his might.

'How are you?' said Egerton, nodding in a friendly way. 'I think I've seen you somewhere before.'

'Servant, sir,' growled Bob Jeffreys, 'though I can't say as *I* know *you*.'

'P'raps the gen'lman 'll jine us, if he's a friend o' yourn, Bob,' said one of the ruffians, making room.

Egerton advanced to the table with alacrity, and the police-officer with the knobby stick managed to interpose himself between Jeffreys and Egerton: at the same time two of the men scattered singly about the room moved so as to be between the punch-drinkers and the door.

'I 'm sure you must recollect me,' said Egerton blandly: 'didn't I put you across the Cam in my boat?'

Bob Jeffreys looked as black as thunder, but after a moment's hesitation, he replied: 'I don't know nothing about no Cam, nor no boats, nor nothing o' the kind. If you'll take a glass o' punch, you're welcome; but you ain't the gen'lman I took you for.'

Digitized by Google

'Then I must be mistaken,' said Egerton resignedly.

'Yes, you are,' growled Bob Jeffreys.

'And being mistaken,' continued Egerton, 'I think that instead of drinking your punch, I ought to stand a bowl.'

All the ruffians swore a frightful oath that Egerton spoke like a gentleman, and even Bob Jeffreys smiled grimly as he said: 'You couldn't say no fairer, young gen'lman: take a glass o' this with us, and then you shall stand the next bowl.'

So Bob Jeffreys returned thanks in a brief speech for the toast that had been proposed, and a second bowl of punch was soon produced at Egerton's expense.

As they were drinking it, Egerton suddenly asked Jeffreys: 'What's the matter with your wrist?'

'What the devil is that to you?' was the fierce rejoinder.

'Oh, nothing!' answered Egerton quietly; 'but I don't see why you should take offence.'

'No offence, sir, no offence,' returned Jeffreys, softening down; 'but I get riled at everybody's asking me the same thing: it's a little bit of a wound I got; it isn't much.' And he concealed his left hand under the table.

'Perhaps you are not aware that the plaster is working off,' remarked Egerton: 'I suppose the wound is nearly healed?'

Jeffreys looked at his wrist, glanced suspiciously at Egerton, and then re-arranged the plaster, which had been worked up by his shirt-sleeve, until a sharp eye could see the curved part of an anchor.

'Yes,' he growled in some confusion; 'it's very near well.'

Egerton now said it was time for him to go, nodded to the party, and with a general 'good-night,' sauntered out.

In the bar he found Sergeant Gumps, to whom he whispered: 'I can swear to the man: he has two false front teeth, and there is the anchor on his left wrist. Besides, I've heard his voice, and watched his face, and I can't make any mistake.'

Sergeant Gumps smiled, and whispering: 'Follow me,' walked into the taproom, the door of which was immediately leaned against by the two men who had been sitting close by it.

As soon as Bob Jeffreys saw Egerton return with Sergeant Gumps, he seemed to have some misgiving; and when the latter walked up and said: 'I'm a police-sergeant, and I want you,' Jeffreys attempted to leap over the table, but was dragged down by the man with the knobby stick.

'You're another of 'em, I suppose,' he muttered, seeing how matters stood.—'Come, lend a hand here, mates.'

His mates were preparing for a rescue, when Sergeant Gumps remarked calmly: 'It's a charge of murder;' whereupon they held aloof, and looked helplessly at one another.

Jeffreys now made a desperate resistance, howled and shrieked, cursed his mates, and uttered the most fearful threats against Egerton; but Sergeant Gumps soon produced a pair of handcuffs, in which, notwithstanding Jeffreys' piteous allusions to his wound, his hands were secured, the sergeant having previously taken the liberty of tearing off the plaster, and exposing to view no wound worse than a tattooed anchor of long standing.

It will easily be understood that Bob Jeffreys was proved to be no other than Jack Andrews, in whose chest was found a suit of clothes, some of which were stained with blood. Egerton certainly could and did state in evidence that the clothes, which were proved to have been those worn by Jack Andrews when he was rowed across the Cam by Egerton, were considerably stained with blood from the wearer's own nose. However, the life-preserver which was fished up from the river was sworn to as being exactly like one which Jack Andrews was in the habit of carrying before the murder, and which he never was known to have in his possession after he had been rowed by Egerton across the Cam; and the life-preserver was just the sort of instrument to inflict the injuries from which the old woman at the pike died. Moreover, a man, who could not well have been anybody except Jack Andrews, had opened the turnpike gate at the very moment that the old woman must have been breathing her last; and after the murder, Jack Andrews had appeared to be as unaccountably familiar with cash as he had before been accountably unfamiliar. In fact, two and two were put together by legal gentlemen in so convincing a manner, that a jury returned a verdict of wilful murder against Jack Andrews; and Jack Andrews was hanged by the neck until he was dead. And Egerton, both in court and in the newspapers, received a severe reprimand for having very nearly enabled a criminal to escape from justice; and young gentlemen were warned to take to heart his example, and, if they would not assist, to at any-rate abstain from obstructing the law, even when its officers were believed to appear in the unpopular form of bailiffs.

A HUSBAND'S VALENTINE.

THE days are long and dull, dear,
For I am far from thee;
Though nature smiles, and skies are clear,
And bursting leaf, and budding tree,
And flowers scattered o'er the lea,
And all things tell that spring is here;
Yet spring is not like spring, dear,
When thou art not with me.

The air is full of song, dear;
I sit here 'neath a tree,
While loud and low, and far and near,
The lark's glad lay, the hum of bee,
And all the changeful melody
Of happy spring invites my ear;
But sweetest songs are sad, dear,
For thou art far from me.

My friend is still the same, dear,
His heart as true to me;
We love with love that scorneth fear;
We think aloud; our speech is free—
Jonathan I, and David he—
Two hearts can scarcely be more near;
Yet still I sigh and pine, dear,
For thou art far from me.

Oh, come, for all things sought, dear,
Will come along with thee;
The skies will be a clearer clear,
And song of bird, and budding tree,
And lambkins pranking on the lea,
And all things sweet will sweet appear:
Then come; my heart sighs come, dear,
And bring the spring to me.

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 272. SATURDAY, MARCH 13, 1869. PRICE 1½d.

DRAWN FROM THE LIFE.

UNDER this title, perhaps it may be permitted to one who has lived long and seen much to narrate certain experiences of Life, not indeed personal, but all well authenticated, and which only do not deserve the name of romances, because they happen to be matters of Fact. The age is sceptical, and whereas at one time Legend, in course of years, was wont to be believed in as Truth, so Truth, at present, in less than a generation, is often regarded as Fiction. It is indeed probable that some of that section of my readers, which, when I belonged to it, was called 'young people,' but which would now resent such a term as an impertinence, may be inclined to question my statements, and in that case I shall be happy to furnish them with names and dates; since, whatever I shall here set down, I promise shall have actually occurred, and that within living memory, and will owe to me only its narrative form. The incidents, however, will be by no means selected on account of their strangeness, but solely by reason of their human interest; they may be terrible, or humorous, or simply curious; the only attribute common to them all will be that they are True.

THE TOLLBAR.

Upon the road of real life, there was, at one time, no object so familiar as the turnpike, although it is an institution that is passing away from many districts, and in London (save at the bridges) has altogether disappeared. According (if we remember aright) to Mr Samuel Weller, a turnpike-man was, or should have been, a misanthrope, living in solitude, and taking delight, on wet and snowy days, in seeing the passengers through his Bar disengage themselves from their warm wraps, and fumble in their pockets with numbed hands for the ticket or the money. Certainly, many toll-gates were placed in lonely spots enough, and apparently set as far from other human habitations as possible; and such a one was Alford Gate, on the Great North Road, and near the Border. It was near nothing else: placed in the centre of a bleak and treeless moor, and visible on both sides for miles to the occupant of the box-seat as the coach came spanking along with its four bays or grays; or to the postboys, as they spurred their horses to the gallop, for the occupants of the chaise behind them were often in a hurry in that locality, it being but a stage or two from Gretna Green. Except for such swift-passing company as these, the turnpike saw few visitors; and in winter-time, even on such a highway, the traffic dwindled to small proportions, and sometimes, when the snow was deep, even ceased for a day or two, so far as wheels were concerned, altogether. But still the horn would be heard sounding cheerily over the white waste of snow, and the guard of the mail, in his scarlet coat, would go *riding* by with the letter-bags as quickly as the 'balling' snow would permit him. The coach had been obliged to stop at the wayside inn on the other side of the moor; or perhaps, even less fortunate, was, with its three remaining horses, stuck fast upon the road.

In such seasons, Alford Gate would be lonesome indeed; and the two ancient women who kept it (for there was no man) found their position anything but agreeable. They had, it is true, a good store of provisions always laid up against such occasions, and plenty of money accrued to them at the same period, for they could not go to the country-town to lodge it in the bank. This last circumstance was a source of well-founded apprehension to them. Mrs Alison, the widow of the late toll-keeper, and who had, at his decease, succeeded to 'the trust,' and her sister, Ellen Bates, were both somewhat ancient dames, and, of course, could not have defended their little mansion against the attacks of even a single robber; while their nearest protector, Jacob Wright, the blacksmith, dwelt at least two miles away across the moor. Often and often, had he and his wife, over a dish of tea at the toll-gate, sympathised with these good ladies, and done their best to comfort them after their several fashions: the wife, by acknowledging the reasonableness of their apprehension, and dwelling upon its special points of horror—the murder of both hostesses (for instance), that would probably precede

Digitized by Google

the spoliation of their dwelling—the husband, by treating their fears as chimerical, and even demonstrating to them how all risk of loss might be avoided by intrusting what money they took in the house by day to the guard of the evening-mail for deposit at Wellborough, the nearest country-town.

On a certain afternoon in early winter, when Mr and Mrs Wright were thus partaking of the hospitality of the sisters, the conversation had especially run in this particular groove; the snow, although not deep, had already fallen in sufficient quantities to keep from travelling all who were not compelled to do so by necessity; and the two poor women felt that their lonesome season had set in, and were depressed in spirits accordingly. There was a good deal of money in the old tin case, which was their strong-box, for the cold and searching winds that had lately swept the moor had kept both the good ladies from going into Wellborough, and they now bewailed this accumulation of wealth—wealth, however, which was not their own, of course, but that of the Turnpike Trust—as likely to prove their destruction. Some ill-looking fellows had slouched by the gate that very morning, and one of them, under pretence of wanting a glass of water, had made his way into their little dwelling.

'Then, send on the money, as I have advised you fifty times before,' quoth honest Jacob, 'by the next coach, and then you will be easy in your mind.'

'Ay, ay,' said Mrs Alison in her quavering voice, 'that is all very well, if we could persuade wicked people that this had been done. But when robbers are disappointed of booty, they are more bloodily inclined than at any other time.'

'And, of course,' observed Ellen Bates, 'we had much rather lose our money—and especially the Commissioners' money—than our lives.'

'Yes, indeed,' assented well-meaning Mrs Wright, 'though it is not even losing one's life which may be the worst of it; for did you not read in the newspaper only last winter that some men with masks broke into a lonely tollhouse, just such as this might be, and put the poor tollkeeper on the fire, and held him there, because he would not tell them where the money was; and they did not believe what was the genuine truth, that it had been sent away for safety.'

'Gad a' mercy, Mrs Wright, you make my flesh creep,' shuddered Ellen Bates; 'and I do greatly wish—only I would never leave my sister here alone—that I was going home with you and your good husband to-night.'

'Come home with us both of you, by all means,' exclaimed the blacksmith, with a good-humoured laugh, 'and leave the tollbar to take care of itself.'

'Nay, that would be a pretty thing indeed,' said the widow, gravely shaking her head: 'if we must be murdered, then we must—or at least *I* must, for Ellen of course is free to go if she chooses—but I will do my duty by my employers, let what will come of it.'

'You're an honest woman,' observed the blacksmith approvingly; 'and I hope you will never suffer for sticking to your duty.'

'Ah, she's a martyr to it, as I am always telling her,' remarked Ellen Bates. 'The times and times she gets up in the middle of the night to put that gate open, and let folks pass; and perhaps only to take a ticket from the last gate: and then, after all, to be robbed by burglars—for that's what 'll be the end of it all, I feel sure.'

'And I must say I've got a feeling of the same sort,' added Mrs Alison solemnly: 'I'm not a superstitious person, but that idea has struck me of late, so as I have turned icy cold with it a dozen times.'

'And yet you have been here a many years, ma'am,' said the blacksmith cheerily—'you and your poor husband as was—without being molested in any way, and far less put upon the fire yonder instead of the kettle.'

'Me and my husband has, but not me and Ellen,' answered the widow gloomily.—'Ah, Mrs Wright, that's the great blessing of a husband, believe me, and may you never come to want it: he's such a preservative against thieves. Oh, the many, many times as I've roused up my poor William, and sent him all about our little house here at night to look for 'em, which, thank Heaven, they never did come! But now—why, whenever we hears a noise—Ellen and me—we can only hide our heads under the blankets, and pray to Heaven that nothing may come of it. As for firing my poor dear William's pistol yonder, I could not do it, even if it was loaded, which it has not been ever since his death.'

'But I see your doors and windows are very well guarded,' said the blacksmith, still doing his best to reassure his hostess; 'and before any villain could make his way through so much wood and iron, there is no knowing what help may not come along the road.'

'Ah, but it's only our door and lower windows that are safe, Mr Wright,' broke in Ellen Bates; 'and any wretch has but to take the chicken-ladder from the yard, and set it up against our bedroom window, and he's in the house in two minutes.'

'To be sure the villain might do *that*,' said the blacksmith, in the tone of one convinced against his will.

'Well, I do pity you both,' observed Mrs Wright, in a tone of genuine commiseration.—'But it's getting near dusk, Jacob, and high time for you and me to be going.—And thanks, I am sure, to you, Mrs Alison, and to you, Miss Bates, for a most cheerful and pleasant afternoon.' For the two sisters were understood to bear the expenses of the household, and consequently of any occasion of hospitality, in equal shares.

When the bluff blacksmith and his kindly wife had taken their leave, the tenants of the little tollhouse found themselves (as well they might) more dispirited and apprehensive than ever. Their fears, indeed, grew to such a pitch as to become the very presentiments which they had hitherto perhaps only imagined them to be.

'Something will surely happen to us this very night, Mary,' whispered Ellen, in melodramatic accents; and 'I shouldn't wonder if it did, Ellen,' was the widow's discouraging reply. In short, the two old ladies, who had as yet no experience, as unprotected females, of a tollgate winter, were fairly panic-stricken.

It was not actually snowing; but the wind moaned with icy breath across the sheeted moor, and shook the fast-closed door and windows menacingly, as though it was going to make a

Digitized by Google

tempestuous night of it; and each sister was privately thinking how, as the night drew on, those gusts would seem as though human fingers were trying to unhinge the shutters, or unbar the door. It was quite a relief to them when, about six o'clock, they heard the cry of 'Gate,' and the sound of wheels, for they did not fear that robbers would come otherwise than on foot, and every honest face was welcome to them at such a time. What was their joy, then, to find in the present passer-by an old and trusted friend, Mark Palmer, a travelling pedler, but who in this season used a cart to carry his wares, which were of a somewhat costly nature. He threw a rug over his mare, and fastened her to the gate, while he got out to have a crack and a glass of spirits with the sisters. He was a short but resolute-looking fellow, of middle age, whose calling in those times exposed him to more danger than we have any idea of now-a-days; and he carried with him, for protection, an enormous mastiff, who remained in his cart on guard while he entered the house. He could not fail to remark the downcast appearance of the two women, who were eager enough to communicate to him the cause. 'Well, in my opinion,' observed he, when he had heard their woes, 'this alarm of yours is all moonshine. You 're terrifying yourselves about nothing. Why, there's the coach at eleven; and the horse patrol at any time in the night; and you 've strong doors and windows, as your friend the blacksmith has told you: while, I daresay, you have not one-tenth of the money's worth in your cash-box that I have in my cart yonder, and yet I have never been robbed yet—and don't intend to be.'

'We 've more than forty pounds there,' said the widow, pointing to the cupboard, which contained this treasure, as well as her little store of tea and marmalade, 'for it was Wellborough market the day before yesterday, when scores and scores ride through the Bar, and we 've not been able to cross the moor since.'

'Forty pounds is a good deal of money,' said the pedler thoughtfully; 'and affords the greater temptation because it 's all in coin.'

'That is so, indeed, Mr Palmer,' pleaded Ellen Bates, clasping her hands; 'and oh, if you would be so kind, just for this one night—for it 's sure to happen to-night—to stay and protect us: we 've got a stall for the mare; and we could give you a nice little supper, and make you quite comfortable down in the warm kitchen here.'

'It would be a great kindness if you would,' added the widow impressively; 'for, otherwise, I feel certain we shall come to harm.'

'Pooh, pooh, Mrs Alison, you will come to nothing of the kind. I am surprised at you—who are so used to tollkeeping—being so foolishly nervous. It is out of the question that I can stop here. But I tell you *what* I 'll do. I have only to get to Wellborough to-night, and do not apprehend any mischief between here and there; so I 'll leave you my dog Towzer, to keep guard. He 's as good as any constable in the world; and to-morrow—when your unlucky night has passed—I 'll call for him again. But when I 'm gone, just hitch the tollgate back, and don't open door or window again to-night, or the dog may run out, and be after me.'

The two sisters, overwhelmed their friend with thanks, as he strode to the door and whistled to his dog, who at once sprang into the kitchen, which seemed to shrink in its proportions at his presence—he was such a very large dog; half mastiff and half St Bernard; with shoulders as broad as those of a prize-fighter, and hanging jaw, and terrible teeth; and with a growl that was as assuring to its master, when danger threatened, as it was depressing to his antagonist.

'There he is, ladies,' said the pedler, introducing this formidable animal to their notice; 'a dog as has not his equal in the north for courage, and who, when he lays hold of an enemy, has never yet been known to let go, except at his master's voice.—Have you, Towzer?'

Whereupon Towzer brought up from his capacious chest some canine monosyllable, that seemed to sound like 'no,' and which echoed gloomily through the little house, and died away upon the moor outside.

It was likely enough that the mastiff might be all that his master had said of him, yet his presence failed to inspire the two women with confidence, when the rumbling of the friendly wheels upon the hard road had ceased, and they were once more left without human companionship. The wind rose higher and higher, and whirled the frozen snow against the panes, as though pebbles were being thrown at them: and now it shook the doors and shutters as though it were indeed about to burst in, in visible shape, while the lesser gusts sounded like dreadful whisperings of felonious men, who made their plans in concert before attack. When the night-mail went by at a hand gallop—a mere passing vision of winged steeds and wrapped-up figures—matters became still worse, for the tenants of the little tollhouse felt that no well-disposed human creature could now be expected until morning. They retired to their bedroom on the upper floor, taking the dog with them; but they did not undress—for it seemed to their unbalanced minds a matter of certainty that the night would not pass by without some catastrophe. They lay down together on the bed and listened, while the mastiff couched upon the floor, his huge jowl half-hidden in his paws, and wholly undisturbed by the elemental strife without. Once only, when a pane of glass—which, however, they knew had been previously loosened—fell with a crash on the kitchen-floor below, he raised his monstrous head and muttered thunder. Two candles were kept burning, and well lit up the little room. It was about one o'clock that a short lull took place in the tempest, and Mrs Alison distinctly heard the sound of footsteps in the back-yard. Her sister, who had fallen asleep for a few moments, in spite of herself, had not heard the noise, and as usual in such cases, affirmed she had been broad awake, and must have been conscious of the incident, had it occurred. The widow did not waste words in argument, but whispered, in trembling accents: 'Look at the dog.' It was evident enough that Towzer had heard something which required an explanation, for he opened his great eyes, and lifted his ears, although remaining otherwise unmoved. 'They have gone to get the chicken-ladder,' continued the widow in tones of calm despair: 'that is what I always said they would do.' And indeed, in a few minutes, there was a dull thud against the window-sill without, such as would be produced by placing the ends of a ladder upon it. It was not a dark night when the swift-flying clouds permitted, as now, the moon to shew herself; yet neither of the women dared look through the pane. They kept their

Digitized by Google

eyes fixed on the dog, in whom their sole hope now rested. The appearance of that magnificent creature was indeed (if they had been in a condition to appreciate it artistically) almost sublime. He had risen in an instant, but without sound, and placed himself close under the threatened spot—the window; every hair in his body appeared alive with excitement; his eyes grew bloodshot, and wore an expression of concentrated fury; but his teeth remained, as yet, in their sheaths, except their white points, which shewed under the wrinkled upper lip.

The heavy shuffling step of some man upon the rounds of the ladder could now be heard—the fall of the knee as well as that of the foot, because the ladder was boarded—and then a hand was placed upon the fragile fastening of the casement.

Then, for the first time, the dog gave audible token of his presence: a hoarse and terrible menace broke from his now open jaws. It was not a growl, and still less like a bark. The man without evidently heard it, for the noise at the window ceased, but he did not seem to recognise it as the thing it was.

'He is sure to have pistols, and will shoot the dog,' whispered Ellen Bates through chattering teeth. She was a lady who always 'speculated for the Fall.'

The widow did not speak, and perhaps could not. She fancied she could hear the very breathing of the man without. After a short pause, the window was slowly lifted to its full height, and a man, whose features were concealed by a piece of black crape, pushed his head and shoulders into the room. The next moment, he uttered a shrill cry of terror, as the huge mastiff sprang at his throat, before he could put up his hands to save it, and bore him headlong to the floor. To see him battling with so terrible a foe, at such a disadvantage, his body half without and half within the room, would, under any other circumstances, have aroused the good women's compassion, but horror and alarm so wholly possessed them that they had no room for pity. They fled from the room, and out of the house, passing close beside the ladder, on the top of which so frightful a combat was proceeding, and dashed across the moor towards the blacksmith's house. The horrid growlings of the dog and the shrieks of the man which filled their ears before they could undo the fastenings of the door, seemed to pursue them across the Waste.

Bareheaded and uncloaked as they were, they heeded not the bitter wind, nor were they conscious of fatigue, nor did they spend the precious breath in speech, but pushed on at their utmost speed. To their great joy, as they drew near the cottage, they beheld a light at the upper window, and congratulated themselves that they would be let in at once, and find shelter and protection from that friendly household. They beat frantically at the door; and presently a quavering voice, through the keyhole, demanded who they were, and what was wanted. They hardly recognised the voice of the blacksmith's wife, and she, on her part, had never heard the accents of her friends so shrill and piteous. The fact was that her goodman was out, and she was almost as frightened at such an unseasonable visit as they were themselves. Then the widow and her sister remembered for the first time how honest Jacob had told them in the afternoon that he should have business in Wellborough that evening; but neither they nor Mrs Wright had had any idea that it would delay him so late, and the fact now seemed deplorable enough to all of them. 'They 've beguiled him to drink at the public-house,' cried Mrs Wright, in injured tones, 'until he thought he might just as well stay where he was till morning; and it ain't the first time, nor yet the second, Mrs Alison. And I am right glad of this—that what has happened to-night (for the fugitives had told their tale) will be a lesson to him not to leave me lonesome here again as long as he lives.' To this sanguine view of man's reformation, it is probable that, under less thrilling circumstances, the experienced widow might have taken exception; but she could think and speak of nothing now save that which she had so lately 'gone through,' and the horrible scene that was perhaps even still being enacted at the tollhouse.

'Nay, but if the dog be anything of a mastiff,' reasoned Mrs Wright, whose father had chanced to be connected with the canine 'fancy,' and who therefore was an authority in the matter, 'he has either killed the man by this time, or the man has killed him, and made off with the toll-money. Unless he shot him, bless you, or could have got at him to cut his throat, you may depend on 't he 's a dead man.'

'Dearey me, I wonder how it has turned out!' ejaculated Ellen Bates.

'I wonder too!' echoed the widow. 'If, as you say, there can now be no danger, Mrs Wright'——

'Lord a' mercy! you ain't thinking of going back again?' interrupted Ellen.

'I will go, if Mrs Wright will go,' answered the widow resolutely; 'that is, when the daylight comes.'

And rather than be left alone, Ellen Bates agreed to accompany the other two.

Accordingly, at the first gray streaks of dawn, the three women, though with beating hearts, crossed the moor to the tollhouse, against the upper window of which the ladder was still reared. With fearful steps, they ventured into the kitchen, where all things seemed undisturbed, and were about to go up-stairs, concluding that both dog and man had fled, when Ellen Bates pointed to the ceiling, on the white surface of which appeared a huge red stain, which had evidently soaked through from the floor above. At the same moment, a noise from the same direction seemed to freeze their blood. It was the sound of some heavy body being dragged over the boards, accompanied by a low and savage growling.

'The dog has killed the wretched man, and is worrying the body,' said Mrs Wright in a hoarse whisper: 'it is just what they do with vermin.'

'This is too horrible!' ejaculated the widow, with her foot on the stairs. 'The mastiff will not hurt me, and, at all events, I will do my best to stop it.'

It was in vain that the others tried to dissuade her. She overcame her terrors sufficiently to enable her to reach the open chamber-door, where a frightful spectacle presented itself. The burglar, a large and powerfully built man, was on the floor, quite dead; while the mastiff, with his teeth still fast in the throat of his foe, and growling savagely, was dragging the mangled corpse hither and thither over the floor. The body of the dog was interposed between his victim, so that his face, from which the black crape had been torn, was at first invisible, but the next movement of the animal

Digitized by Google

revealed it. As it did so, a terrible shriek burst from the lips of Mrs Wright, who had followed close upon the widow's footsteps, and she fell heavily upon the floor in a swoon; for the would-be thief that lay dead before her was no other than her own husband, the Blacksmith!

THE DOMESTICATION OF THE OSTRICH.

The late M. Isidore Geoffroy Saint-Hilaire, in his remarkable work, *The Acclimatisation and Domestication of Useful Animals*, mentions the ostrich, the nandow, the cassowary, the emeu, as deserving of attention, on account of their excellent flesh, their enormous eggs, and their valuable feathers. Because of their alimentary qualities, he applies to them the new term of butcher-meat birds. The resemblance of the ostrich to the ruminating quadrupeds was observed by the ancients. Aristotle asserted that it was partly bird and partly quadruped, and Pliny thought that it might almost be regarded as belonging to the class of beasts.

Though the ostrich and the cassowary be natives of warm climates, their acclimatisation presents no peculiar difficulties; and that the nandow and the emeu can reproduce in Europe has been demonstrated. The emeu has bred in France, Belgium, England, and elsewhere, and exhibited an extraordinary power of resisting cold. At Paris, one lived for several years in the open air, refusing the shelter provided for it, and sleeping in winter half-covered with snow, protected by its impenetrable fleece of feathers. Its flesh, according to M. Florent Prévost, may be compared to that of the ox, and would be valuable as butcher-meat, seeing that the thigh of an emeu may weigh more than twenty-two pounds; the flesh of a young one, of from fifteen to eighteen months, when it is full grown, is highly esteemed, the taste being something intermediate between that of turkey and pork. Its eggs, one of which is equal to a dozen hen-eggs, are very delicate, and of an exquisite flavour. Its skin, covered with abundance of down, serves for the making of valuable carpets, and its pliant and graceful plumes are used for ornament. A further idea of the value of this bird will be formed, when we add that for its domestication the Imperial Acclimatisation Society has offered a medal of fifteen hundred francs. There is a special reason why persevering attempts should be made in order that it may be domesticated in Europe: it is one of the five species of wingless birds still existing, but destined to speedy extinction, unless efforts be made to introduce them into countries to which they are not natives.

While the acclimatisation of a bird so hardy as the emeu seemed to present no serious obstacles, that of the ostrich was hardly to be expected without long delay and much pains; and yet this apparently hopeless experiment is already so far advanced as to justify the belief that ere long the ostrich will be domesticated in Europe. It has been much promoted by the zeal of two members of the Imperial Society of Acclimatisation—M. Gosse, a learned physician and physiologist at Geneva; and M. Chagot, a Parisian merchant. The latter gentleman, observing that the ostrich was becoming scarce, and being desirous to prevent the extermination of a bird whose feathers are an important branch of commerce, generously founded a prize of two thousand francs for the multiplication and domestication of the ostrich in France, Algeria, or Senegal.

Unsuccessful attempts at ostrich-rearing have been made both at Marseille and Paris; but better fortune has marked those at Florence and Algiers. In 1857, M. Hardy of Algiers was on the point of succeeding in his experiment: a pair of ostriches began to sit upon their eggs, but soon forsook them, in consequence of the nest being drenched with rain. To prevent the recurrence of such an accident, he raised a hillock of sand where the nest had been, in the hope that a second deposit of eggs would be made in it. About the middle of May, a new nest was scraped in the top of the hillock; in the end of June, the birds began to sit a few hours daily; on the 2d July, they took to sitting with greater regularity; and on 2d September, a young one (a female) was seen walking about. This was the first authentic instance of an ostrich born in captivity. It throve so well, that when ten months old it was as big as its parents.

In 1858, the same pair of birds hatched nine out of twelve eggs; and, during subsequent years, M. Hardy was equally fortunate in rearing young ostriches from others in his possession. In ten years (1857 to 1867), forty-two couples laid 875 eggs, and hatched 162 young ones, of which, at the end of three months, 103 survived. M. Hardy gives interesting details of the profit on his flock of twenty-one adult male and female ostriches in 1866. The total was 5918 francs, 20 cents; or 281 francs, 80 cents per head. These birds consume daily five hundred grammes of barley and grass, and, failing this, *opuntia* cut into pieces. This food, including attendance, does not exceed twenty cents each per day, or seventy-three francs a year. The feathers furnish the greater part of the profit: they are sold by public auction, and according to weight. Fifty wing-feathers, selected for the Universal Exhibition, were valued at 199 francs, 50 cents. When ostriches are so abundant as to be sold in the meat-market, there will, of course, be a new item of profit from the sale of the flesh.

The acclimatisation of the ostrich has been prosecuted with like success in the Zoological Garden of San Donato at Florence, at the instance of Prince Demidoff. From the interesting account which the prince has given of two hatchings, we learn that the first incubation was conducted solely by the male; the female only coming near the eggs when he retired to eat, and turning them over carefully, after which she retired. The second hatching was carried on by the male and the female in turn, the greater part of the toil, however, being left to him. On one occasion, during a torrent of rain, when one could not have preserved the nest, they both sat on it. The second hatching also exhibited this

Digitized by Google

pleasing feature, indicative of domestication—the birds were tamer, and permitted the approach of strangers.

On account of its comparatively high northern latitude, 45 degrees, its height above the sea, 645 feet, and its average temperature, 53 degrees Fahrenheit, Grenoble must be regarded as furnishing the most interesting instance of ostrich-rearing. In April 1864, in the Acclimatisation Garden of the Zoological Society of the Alps, a male ostrich had scraped out a hole a foot and a half deep, and more than three feet broad, for the reception of the eggs, whose coming his instinct had taught him to expect. The laying began in May; two eggs being produced at an interval of six days, but both were broken and eaten by the female. A second laying commenced 15th May, and proceeded regularly, at an interval of two days, up to 6th June, when she had produced eleven well-formed eggs. A third laying produced only two small and deformed eggs, which was an evidence that the laying was over. The laying took place with remarkable regularity every second day, at three o'clock afternoon, without a variation of ten minutes before or after. From 25th May, the male wished to hatch, and sometimes sat on the eggs; but after 30th May, he only left the nest in order to allow the female to lay. After the last egg was laid, the female sat on the eggs for a few minutes in the middle of the day; but the male always sat at least twenty hours a day.

This curious incubation proceeded thus. Every morning at seven o'clock the ostriches were turned out of their enclosed lodge, in order to have a gambol before breakfast, which generally consisted of bread, barley, and grass. The repast being terminated, at the order of the woman in charge of them, they returned to the nest, from which they were not to stir for the next twenty-four hours. They were as easily managed as Cochin fowls, and never once rebelled.

Of the eleven eggs, two were broken before incubation commenced. On the forty-fourth day after regular sitting began, a young one was seen at the edge of the nest. Impatient to see what the nest contained, M. Bouteille obliged the ostriches to leave it. It had two young ones not yet free of the shell. Of the seven remaining eggs, three were ascertained to be barren, and taken away, and four doubtful were left. As soon as permitted, the male resumed his place on the nest, as if it had not been touched. At the end of four days, the eggs were broken, and found to contain embryos dead at different ages.

The day after they were born, the young ones slipped from below the male, and began to peck sand as well as a paste of hard eggs, bread, and lettuce, which was prepared for their parents, so that there was no anxiety as to what to feed them on. At first, these young ostriches were about the size of a female wild-duck, which they also resembled in form; but in a fortnight, they had nearly doubled in size, and accompanied their parents everywhere, pecking at the sand, and running under their legs when they heard them eating. The female, which paid such little heed to her eggs, was a most anxious mother, keeping her young ones constantly in sight, and instantly running to them in answer to their call, which resembles that of a young turkey when frightened.

These semi-domesticated ostriches therefore do not deserve to be charged with lack of natural affection, an accusation which Old Testament writers prefer against the ostrich of the wilderness; neither are they so stupid as that is said to be. They were shy, but as capable of becoming attached as most of our domesticated animals: thus, at Grenoble, the woman who had charge of them took the young ones into her arms without the parents shewing displeasure, whereas, at the sight of a strange man or animal, they got into a fury.

M. Bouteille thus concludes his account of them: 'I believe this experiment of importance, because of its practical interest. It is, in fact, a hatching and rearing in a courtyard which I have been describing, and in this respect it is new; and I do not believe that such a result has been obtained in any latitude so far north as ours.'

The same gentleman relates the continuation of the experiment up to 1867, and from his account we gather the following particulars.

In 1865, ostrich-rearing at Grenoble up to the tenth month was successful; but then three young ones, as big as their parents, died, in consequence of a singular accident, the cause and the remedy of which are alike unknown. Frightful fractures and dislocations occurred even when the animals were not in violent motion; in one instance, while a workman was at hand, and heard not the slightest noise. Thinking that this extreme fragility of bone might be due to want of calcareous material in their food, that was supplied, but not in time to prevent the last accident. This fragility has likewise been noticed at Madrid, but apparently not to the same extent.

But though these experiments be not all *couleur de rose*, M. Bouteille thinks there is no reason to be discouraged. 'I have,' he observes, 'now become convinced that the reproduction of the domesticated ostrich is a completely settled fact; this domestication is not only interesting to science, but also to those who occupy themselves in finding out new alimentary and industrial resources. M. Saint-Hilaire thought that the ostrich might become a butcher-meat bird. Our too frequent accidents have enabled us to know this from experience. The flesh of the ostrich is abundant, substantial, well tasted, and something like the flavour of the hare. It may be prepared like that of the ox or the hare, stewed or jugged; as a roast, which is the test of good meats, it leaves nothing to be desired. All of the many who have eaten it at Grenoble found it excellent. The flesh of the ostrich is not the only edible product of the animal; the three layings in 1866, gave us 45 eggs, weighing in all 154 pounds. Prepared in different ways, they have always been found very good. An ostrich-egg on a dish looks very appetising, from the whiteness of its albumen, in the middle of which the yolk shines like an eye of the brightest yellow. As an omelet, this egg in no respect differs from that of a fowl, but its yellow is incomparable for the preparation of creams.

'After the alimentary products come the feathers, which are not less important. The plumes of our adult ostriches, after moult, were sold for 300 francs (L.11, 18s. 1d.). I shall end this letter with some figures which, I hope, will prove that the rearing of the ostrich may be profitable, even in France. In our enclosure where the animals are liberally fed, the annual cost of food is from 80 to 90 francs each. Taking 1866, which was the least productive of the three years of our experiment, the plumes produced 300 francs, and the 45 eggs

Digitized by Google

180 francs, which is a low price, as the shells alone sell for 3 francs each. From this gain of 480 francs, deducting 200 francs for food and keep, we have a gain of 280 francs (L.11, 2s. 3d.) on two adult ostriches. But taking the average of three years, and reckoning the young ones sold, the profit amounts to 560 francs (L.22, 4s. 6d.).'

These details of the profits of ostrich-rearing, even under the disadvantage of a European climate, are sufficient to excite attention. No notice is taken of the industrial value of this huge bird: as it can carry a man with more than the speed of a swift horse, we do not see why, in 'the good time coming,' the people of sundry localities should not have their letters conveyed by ostrich-post; or why a morning ride on the bird should not be the means of acquiring an appetite big enough to make a sensible impression on an omelet *à l'autruche* of the respectable weight of some three or four pounds.

But while such results are possible in Europe, they are likely to be exceeded in Africa, the native country of the ostrich. We shall therefore conclude this notice with a brief allusion to its domestication at the Cape of Good Hope.

If the attempts of the French in Algiers to prosecute ostrich-rearing merit attention, we are more specially concerned to know how similar experiments succeed in the southern extremity of the African continent, in our colony at the Cape. Our information is derived from a communication of M. Héritte, French consul at Cape Town.

Although only of recent introduction among a few of the agriculturists at the Cape, the domestication of the ostrich is so zealously prosecuted, that there is a considerable flock of this bird. At the age of from six to eight months, the young ones are left at liberty night and day. They provide for themselves, and only get, now and then, a small quantity of maize, or other food, in order to attach them to the place where they are reared, as without this they would become very wild. They are very fond of the prickly pear, and of the seed of the aloe when the leaves have fallen. The young ones are fed on leaves, cut small, all kinds of vegetables, carrots, lettuce, thistle, and the prickly shrub, *Dubbeljes doorn*. When three days old, they get, besides these plants and vegetables, a little maize or barley. They are kept warm at night on straw, hay, or wool, in a warm room—a kitchen, for instance—are never permitted to go out till the sun is up, and are supplied with food during the whole day.

The ostriches are chiefly valued for their feathers, which are not plucked till they are eighteen months old, and during the months of August and September, corresponding to our February and March. The best ostrich-feathers of commerce come from birds living in the most arid and sandy regions, where there are few prickly shrubs capable of injuring the plumes. The depreciation of those taken from the domesticated animal is reckoned at thirty per cent.; nevertheless, the feathers of tame ostriches are of such value as to claim attention. Last year, one person received in London L.98, 14s. 2d. for the feathers of eighteen young ostriches, though in bad condition, having, from want of experience, been plucked at an improper season.

An ostrich-egg is deemed equal to twenty-four hen-eggs, and keeps long, owing to the thickness of the shell. At the Cape, ostrich-eggs are much used in the making of very good and economical cakes.

When we add that, at the Cape, ostrich-rearing is believed to be almost as profitable as keeping merino sheep, we have said enough to demonstrate that this is a species of industry which may be advantageously prosecuted in many portions of the globe, including not a few British possessions.

THE BASTILLE.

IN TWO CHAPTERS.—CHAPTER I.

THE idea commonly entertained of the Bastille is that within its precincts it combined all the horrors of our Tower, the Star Chamber, and Newgate; with the additional aggravation, that its dungeons were crowded, and that the greater number of the prisoners were innocent victims of arbitrary power, exercised at the instigation of private individuals, for the gratification of their malice. In short, the word was understood by a past generation to imply all that was odious and horrible in connection with prisons; and when the opposition to the erection of union workhouses was agitating the land from end to end, it was thought that everything evil that could be said of them was comprised in the denomination 'Poor-law Bastilles.'

An examination of the records concerning the Bastille preserved in the French archives shews that this impression, though not far from the truth, was greatly exaggerated in regard to the number of persons who were imprisoned in it.

Previous to the Revolution, the populace had as little reason to care what passed within its walls as the people of London had in what was done in the Tower, when it too was a state prison. The prison the Parisians had more cause to abhor was the Bicêtre, being that in which the commonalty were shut up; and we gather that this was really the case. What the Bastille really was, and the reason why all the proceedings that took place in it were surrounded with such deep mystery, can now be ascertained from the investigations of M. Ravaisson, who has spent a lifetime among the dusty records of past centuries in investigating the history of this fortress.

Most of the dramatic stories that are still current in every European language were manufactured immediately after the taking of the Bastille, and nothing is more easy to conceive than that the more highly coloured these narratives were the better the chance of the book obtaining a large sale; hence the pathetic tales of Pellisson's spider, crushed by the foot of the brutal jailer, according to Delille; the cat of which Madame de Staël wrote; and the rat tamed by the younger Crébillon, who, if he deserved his imprisonment for no other cause, deserved it on account of his writings. As to the discovery of iron cages, of skeletons, and many other horrors, they for the most part existed only in the imaginations of the narrators; and as regards the human remains found on the demolition of the building, and which gave matter for so much sensational writing at the time, it is now shewn that they were in the part of the building

Digitized by Google

occupied by the surgeon; there is nothing to prove that they were the bodies of prisoners, and that they had not died from natural causes. So far as this matter is concerned, it was settled by the declaration signed by three competent persons appointed to inquire into it, which was published in the *Moniteur* of the 5th May 1790. The same holds good with respect to the assertions of the discovery of a scaffold, of instruments of torture, and of a torture-chamber in one of the towers where the 'question' was administered. It is now found that no authentic evidence exists of the prisoners in the Bastille having been subjected to the brutal tortures that were undoubtedly administered elsewhere. The 'simple question,' by water and the boot, was occasionally employed, and these were bad enough; but we do not find proof anywhere that we can implicitly rely upon of any individual having been punished in this way, except in the case of a Protestant preacher named Langlois, whose case, as far back as the close of the reign of Louis XIV., is detailed in a work entitled *Two Years' Mission at St Petersburg*, by Count Ferrière Perey.

The first and primary motive for building the Bastille was the defence of Paris. The first stone was laid on the 22d April 1367, and the original design was for a gateway, similar to many that might formerly have been seen in many places in England, and especially on the coast, where some of them still remain in very good condition, notwithstanding the time that has elapsed since they were built. The two towers which composed this gateway were exceedingly strong, and so also were the walls erected to connect these towers with two others built subsequently. Surrounding these towers was a moat twenty-five feet in depth, which at first was considered a sufficient defence against a surprise; but in a few years afterwards, when the dungeons contained in the fortress had become the receptacle for prisoners of mark, this fosse was bordered by citadels, outside of which another ditch was dug, beyond which was the boulevard, and beyond that again another deep excavation; on the completion of which, together with the fortress of Vincennes, Paris was not only well protected against enemies without, but the inhabitants themselves were under the domination of the huge edifices, which thus served to quell the turbulence of those who had previously given the ruling sovereign so much disquietude and humiliation. Within the succeeding two hundred years, it was still further enlarged, until it comprised eight towers; but from 1660 down to the time of its destruction, no change was made in its dimensions.

When civil war in France was at an end, and Paris was no longer in danger from sudden onslaughts, the Bastille was devoted entirely to the purpose of a state prison: the regulations were drawn up which fixed the mode of procedure, and which were adhered to with such unvarying tenacity as added not a little to the dread its very name inspired among that class who were liable to be immured in its dungeons.

The first link in the chain of proceedings was the *lettre-de-cachet*, which was signed by the king's own hand, and countersigned by the minister of Paris; and after the arrest of the individual specified in it, it was endorsed by the governor of the Bastille, and added to the records of the institution. Curiously enough, the privilege, as it was considered, was occasionally granted to the person named in the lettre-de-cachet to carry it with his own hand to the governor; but the usual course was to transmit it to the lieutenant-general of police, who nominated the officers on whom the duty was devolved of actually performing the arrest, their grade varying according to the rank of the prisoner. When arrested, the criminal was placed in a carriage, the principal officer concerned in his arrest taking his place by his side. On arriving at the precincts of the prison, the carriage stopped at the entrance of what had very much the appearance of a blind alley. The sentinel stationed at this point challenged the party, and on receiving a satisfactory reply, he raised the bayonet he had lowered to bar their advance, which was the signal to the cavalcade to proceed past the half-dozen shops, the barracks, and stables to a gate situated at the end of a drawbridge, usually kept raised. The rattling of the chains which accompanied the lowering of this bridge must have driven the blood from many a cheek which would not have paled on a battle-field. As soon as it had been lowered to its place, the prisoner and those who accompanied him descended, and proceeded on foot to a second drawbridge, situated before the great gate of the fortress. This obstacle passed, the party arrived at a last drawbridge, also defended by a guard of soldiers, one of whom constantly paraded backward and forward between two portcullises or gates, which formed a kind of cage. Passing through these, the prisoner and his guard found themselves in a large open space, where the inferior class of prisoners were permitted to take exercise.

Facing the entrance was a massive tower, flanked by two courts, and divided as to the basement by a passage, of which a fair idea may be formed by the passage which runs through the Horse Guards' building in Whitehall, only that it was narrower and even more gloomy than that dungeon-like tunnel. The windows of this tower, as we must call them in default of any other name, were mere slits in the wall. The ground floor contained the kitchens and other domestic offices, and above these were apartments usually occupied by prisoners of no importance; though they were not always so occupied, for the Cardinal de Rohan, the same who was mixed up in the mysterious affair of the queen's necklace, was confined therein. On the second floor lived the king's lieutenant, whose principal occupation was the watchful observation of the two courts above mentioned. The remainder of the repulsive-looking edifice was devoted to apartments in which were stored the records, and the property the prisoners happened to have about them when brought in; those in which they underwent examination; and others connected with the performance of the duties of the law officers. Indeed, the work done within its walls was in keeping with the dismal effect produced by the first sight of it on the minds of those who passed through the gates; the only relief to the otherwise blank aspect of the structure being the clock, though even this was surrounded by emblems not by any means calculated to lessen the sinister appearance of the tower itself, being supported by two figures loaded with chains, beneath which were the rings which assisted in supporting the

Digitized by Google

scaffold on which the Marshal de Biron was executed.

It may easily be imagined that the unfortunate —whose arrival was announced by the doleful sound of a deep-toned bell—did not require many seconds to notice the peculiar features of this dreaded prison. The procession to the gate was swelled by the governor himself, or the major, followed by a body of jailers, according to the rank of the criminal. The only sounds heard as this procession moved along were the jingling of the keys and arms. Everything was done according to system; the march was slow and solemn, as though it were attending a funeral. Before the gate was opened, an inspection was made of the new occupant, whose personal appearance was carefully compared with the description that had been given to the king's lieutenant. Then the receipt for the delivery was signed; the few questions that had to be put having been asked in a low voice, the whole party proceeded to the residence of the governor. Here the prisoner had to enter his name in a register. If he was a man of rank, the king's lieutenant himself despoiled him of everything he had in his pockets or about his person; an operation that was performed with far less gentleness by a sergeant or a jailer in the case of prisoners of an inferior grade. The articles of which the prisoners were relieved were, together with their clothes and papers, if they happened to have any, entered in a book with the most scrupulous minuteness, and deposited in the store devoted to their reception; unless the prisoner was to undergo an immediate examination, in which case they were provisionally placed in a box, which was then fastened and sealed. Three times in the course of his life did the Duke de Richelieu endure this process, and another prisoner, Lenglet-Dufresnoy, no less than six times. When this formality had been completed, the prisoner was led away to the apartment to which he was consigned. To some favoured individuals, rooms in the governor's residence, or on the first stories of the towers, were assigned; to the least favoured, a dungeon.

The total number of chambers for the reception of prisoners was forty-two—thirty-seven in the towers, and the rest in the walls that connected them with each other. In the foundation of the towers were the dungeons, and of a most horrible description these were. Wet, dark, and foul, the only opening for the admission of light and air being a narrow slit in the immensely thick walls opening on the ditch, and tenanted by crowds of rats, the miserable wretch who was doomed to confinement in one of these having to fight incessantly for his life with the hungry and ferocious creatures about him. The records of the Bastille contain several petitions from the prisoners confined in these dreary dungeons. Between these latter horrible abodes and the apartments in which the great state prisoners like Richelieu were confined, there were others of an intermediate character, in which the prisoners were exposed to the rigours of the cold in winter, and the heat of summer endured under circumstances which made it almost suffocating.

So far from a large number of prisoners having been found in the Bastille when it was captured, a careful inquiry proved that only seven were found, and of these there were some who, like those confined in Newgate, as spoken of by Dickens in his account of the breaking open of that prison, had become so habituated to their quarters, that they complained of being disturbed by their liberators; the smallness of the number considerably staggering the insurgents, who expected to find hundreds rotting in dungeons, and who consequently began to doubt whether their liberation had not been procured somewhat dearly at the price of eighty dead and seventy-three wounded. In fact, only seven or eight chambers were found furnished. A document has indeed been discovered, signed by M. Breteuil, ordering that eighteen others should be prepared, but there was nothing to prove that this order was carried into effect; yet this absence of proof does not of course establish that the number of persons imprisoned in the Bastille did not exceed the number indicated by the small number of apartments provided, as a bundle of straw or a mattress could as easily have been thrown down as removed, without leaving traces of the chamber having been used.

Other evidence, however, exists on this point, that of Linguet, for example, who says that according to the agreement between the government and the governor of the prison, the former were bound to pay him for provisioning fifteen prisoners, even when there were not so many under his charge; the amount he received being about eight shillings a day of English money. It certainly was not out of this allowance that the governor made the large fortune he usually accumulated during his tenure of office, a fortune very hardly earned, seeing that he was never permitted to leave his post. The source whence he derived this was from prisoners who were able to pay for indulgences in the matter of lodging and treatment, and from supplying them with provisions, which was sanctioned by the regulations, that fixed the tariff at one hundred sous for inferior prisoners, ten livres for the clergy and those of the middle class, fifteen livres for members of the parliament, and from twenty-four to thirty-six livres a day for a lieutenant-general or a field-marshal. Besides, a register found when the prison was taken shewed that in the course of forty-six years only two thousand prisoners were received, giving an average of forty-four a year; and even half this number must have been badly accommodated, for notwithstanding the space occupied by the prison, the walls were extremely thick, and the two courts along which the cells were ranged were very small, the largest being but one hundred and two feet in length by seventy-two in breadth, and the lesser seventy-two in length by forty-two in width. From these cells the prisoners could see but a small patch of sky about the size of a blanket, and it must have been seldom that a current of fresh air made its way into the interior. The hardship of an imprisonment in such dens was somewhat mitigated, in the case of most of the prisoners, by the permission to take exercise in the courts. Comparatively fortunate was the man among them who was lodged in one of the chambers about midway between the basement and the sky of the seven stories comprised in the huge towers. The entrance to the staircases in these was barred by two doors, each having a different lock, and the communication between the several stories was cut off by a strong iron grating. The cells also had two doors to each, varying from two to three inches in thickness. Most of the floors of the cells were also double,

Digitized by Google

the space between being carefully filled up, to prevent communication with the prisoners above or below. At the slightest appearance of a crack in the ceiling, the plaster was renewed, and once every week it was the custom to make a careful examination of the cells, in which both sight and sound were exercised with the utmost circumspection. The furniture of these cells, though limited to bare necessity, was sufficient; it consisted of a bed with paillasse and mattress, one or two tables, a like number of chairs, a candlestick, a jug, a fork, a spoon, and a pewter mug. To guard the fortress in which these few prisoners were confined, there was a garrison of about eighty veteran soldiers, which was strengthened in times of trouble.

As regards the supply of food to the prisoners who were not immured in the dungeons, it was abundant; on this head, we have the testimony of Queen Anne of Austria's chamberlain, in addition to other sources of information. Nor were the prisoners prevented from meeting and conversing in the courtyard, so that the garrulous old veteran, Marshal Bassompierre, who, according to his own account, had been a great favourite among the ladies in his time, had the opportunity of continuing to try his fascinating powers on a young lady who was also a prisoner. To be more precise as to the quantity of food allowed to prisoners, we may quote the evidence of Constantin de Renneville, who says they had three meals a day, and at each of these meals several dishes. At dinner, they had an allowance of two bottles of wine, either burgundy or champagne, with an extra allowance on certain days observed as festivals; in short, so liberal was the diet that some of the prisoners, like the Englishman under similar circumstances, proposed to take a part of it in money, and to share it with the governor; a proposition which, if it had been acceded to, would not have been to the taste of the jailers, who were able to feast abundantly on the portions left in the dishes as they carried them down-stairs, and whose slow steps were a subject of jesting to the men they assisted in guarding.

Under the eyes of the guards, prisoners were allowed, during the hours they spent in the courts, to make up little parties at cards, ninepins, chess, billiards, and other games; to join in music and singing; to keep animals of various kinds, birds (not excepting pigeons), until it was discovered that they were used as go-betweens from those within to their friends without the walls. These indulgences, however, which were so freely accorded through a long period after it had ceased to be regarded in any other light than as a prison, were one by one withdrawn, until at last the keeping of any living creature became an illicit indulgence, and the only source of amusement that was never withdrawn was the supply of books from the library. The permission to commit their thoughts to writing was only obtained with difficulty, and the sheets of paper with which they were furnished were carefully numbered and initialed by the king's lieutenant. No opposition was ever made to the free performance of what they regarded as their religious duties.

Nor were the prisoners, at one time, entirely cut off from the sight of the world outside the walls. It is on record that they were allowed to see from the tops of the towers the people passing below, and could therefore exchange signs of friendly greeting; but as to communications between them that was impossible; the jailers were incorruptible; and so ignorant were the prisoners of what passed in the world, that when the overthrow of the Bastille took place, one of those liberated asked if Louis XV. was still alive.

THE LUUR.

I WAS travelling late one summer evening through one of the most lonely and picturesque valleys of the western coast of Norway. It was impassable for all save the sure-footed mountain-pony of that country, so that I preferred often to trudge a few miles on foot, my luggage, rods, &c. being strapped on the pony's back. It was one of those delicious evenings that are to be found, I think, only in northern latitudes; for, though it was close on midnight, the sun still shone on the tops of the mountains that hemmed in either side of the narrow valley; while below was quite light enough to read the smallest print with ease. My guide and pony were about a couple of hundred yards in front of me, for I loitered behind every now and then to admire the grandeur of the scene, or to watch the ever-shifting light on a distant glacier, which looked more like a sea of opal than anything else to which I can compare it. Indeed, every yard I advanced, there was something fresh to wonder at. Now it was a torrent falling perpendicularly downward from the heights above, and losing itself long ere it reached the bottom in masses of feathery spray, affording a wondrous display of aquatic fireworks; now it was a grand waterfall, leaping and dashing down the fjeld side in impetuous haste to reach the river, that fretted and chafed along like an angry serpent at the bottom of the valley. And yet, with all the din and noise of the roaring flood, there was a deathly, oppressive stillness. Not a breath of wind stirred, not a sound of animal life was heard, save here and there the tinkling of a distant cow-bell, the whirring of a goatsucker on the wing, or the splash of a salmon in the river below.

All at once, however, I was startled by hearing a loud though melodious sound far above my head among the rocks. It reminded me more of the Alpine horn than anything I had ever heard.

'What is that?' I inquired as I hastened on to catch up my guide.

'It is a *luur*!' was the reply. A *luur*, I must inform my readers, is a long horn made of birchen bark, which the peasants use to collect their cattle. It struck me at the time as being strange for people to be out at that time of night so late with their cattle; but my attention was soon diverted to other objects, and I daresay I dismissed the strangeness of the incident from my thoughts with the reflection that nothing could in truth be strange in a country where day and night were one.

Before long, I arrived at the farmhouse where I was expected, and where I intended staying a few weeks salmon-fishing. Late though it was, my host was waiting to receive me. He was a middle-aged man, with long flaxen hair flowing down to his shoulders, and was dressed in full national costume. He greeted me in true Norwegian style, and after expressing his fears that I must be weary, led the way into the house, where an ample supper was laid out for me. I had an introduction to him from a friend of his in Christiania, who promised

Digitized by Google

me some excellent fishing, if I would consent to put up with a rough life for a few weeks.

Ingebrast—such was the name in which my host rejoiced—was a tall broad-built man. His features were finely chiselled; in fact, he was a person who could not fail to attract attention wherever he might be. He was a widower, but his only daughter, Ingeleiv, lived at home with him, and managed his domestic affairs for him. These two, with some half-dozen farm-servants and their families, who lived in huts close by the farm-house, formed the whole population to be found for a distance of several miles. Ingeleiv was a true specimen of a Norwegian mountain beauty: tall in figure like her father, with the same auburn hair, and blue melting eyes, she presented a picture that an artist would have loved to paint.

'Twas beauty truly blent, whose red and white
Nature's own sweet and cunning hand laid on.

There was a something, too, about her that attracted my attention; perhaps it was her bearing, approaching almost to stateliness, that struck me. At all events, she seemed immeasurably superior to what a Norwegian farmer's daughter usually is.

But before retiring to bed, my host informed me, to my surprise, that he was a lineal descendant of the great Harald Haarfager ('Fair-haired'). His family, he said with an air of conscious dignity, had never mingled with any who were not of royal blood. He was the last of his race, and before he died, he hoped to see his daughter married to a cousin of his, who lived I forget where.

How strange it all seemed to me! There, amid the fastnesses of the mountains, to meet with a man who could trace his descent from kings whose names have left a stamp on the page of history. Turning these things over and over in my mind, I soon fell into a peaceful slumber. How long I slept I know not, but I was awakened by hearing the same plaintive sound of the luur on the mountain side opposite. I sprang out of bed, and throwing the window open, distinctly heard a voice calling or rather singing in a melodious key: 'How *is* ——?' And here followed a word I could not catch; and then another voice at a long distance off took up the strain, and made some reply in the same harmonious key. I listened to hear it repeated, but all was still; so again seeking my couch, I resumed my dream about monstrous salmon and countless herds of reindeer.

Next morning, I was soon down; and as Ingeleiv was laying out breakfast for me in the large kitchen, her father came in from seeing after his farm, and made earnest and polite inquiries about the way in which I had passed the night.

'Famously!' I answered; 'but some of your people were early astir, for I could hear two voices on yonder mountains as if after the cows;' and putting my hands to my mouth I imitated as well as I could the sound I had heard.

'Strange!' he answered, 'for I have no cattle on the mountain this summer.—Did you hear it, Inga?' turning to his daughter.

But Inga's averted face, which was the colour of scarlet, plainly shewed me that she did know something *more* about it than her father knew. So thinking it might be a lover, and that they were obliged to adopt this method of courting, or of 'luring' each other, I quickly turned the subject and spoke of other things. From that day, however, Ingeleiv avoided me, and thus deprived me of any opportunity of finding out the mystery of the luur.

I will not fatigue my reader by dwelling on the sport I had with the salmon, nor yet on the excursions I made after reindeer in company with my host, who was a clever hunter and capital shot; suffice it to say, I thoroughly enjoyed myself. But, alas! it was time for me to think of leaving; and I was the more sorry, because I could see that Inga was evidently unhappy, and wore about her pretty and formerly cheerful face an air which betokened great mental suffering.

It was late in the evening when I bade my kind friends adieu, for I wished again to traverse that mountain valley by night. My *skyts-boy* (they call them all boys in Norway, whether they be old men, or even of the opposite gender), or post-boy, was an intelligent youth of two or three and twenty years. We soon became great friends, and in less than half an hour he had communicated the history of his life to me. 'He had been educated as a schoolmaster,' he said, 'but was now only a labouring servant on an adjacent farm.'

'Everybody seems to fall instead of rise in these parts,' I thought to myself, when he had concluded his tale. Our road lay up a steep rocky path. Carl—such was the lad's name—was leading the pony in front by the bridle, while I as usual was sauntering behind to catch a last long look of the lovely scene, when again I was aroused from my reverie by seeing him place his hands to his mouth, and directing his voice towards the mountains, send forth a plaintive sound. In a few seconds I heard it thrown back from the rocks, and should doubtless have thought it was but the echo, had not the waving of a woman's garment two hundred feet above my head attracted my eye.

'I will find out this mystery before I go,' I said aloud, for, indeed, so engrossed had I been with fishing and shooting, that it had quite escaped my memory. 'Carl,' I said, 'what is that?'

He seemed quite taken aback at the suddenness of the question, but laughed it off by saying he was only calling for amusement.

'But I tell you, some one answered you up yonder; and see, she is waving her hand towards us. I will go and see; do you wait below.'

And in a few moments I had clambered up the hillside to where I had fancied I had seen the woman standing. She was no longer visible; but I observed a low hut built of leafy boughs, a few paces off, nearly hidden behind a rocky ledge.

Carl now caught me up, and tried to dissuade me from entering; but the despair depicted on his face only made me the more resolved to carry out my determination, so, pushing him back, I opened the door and entered the hut.

A strange sight met my eye. On the middle of the floor was a little cradle, in which a rosy-cheeked baby lay sleeping, while kneeling down by its side, as if keeping guard over her child's slumber, was its mother. She raised her head on my approach, and I saw, to my astonishment, that it was none other than the pretty daughter of my host. 'Ingeleiv!' I said, 'you here!' as the whole mystery now lay open before me.

'Oh, tell him, Carl!' she answered, bowing her head down, as if afraid to look me in the face—'tell him! I know he is a kind man, and may help us!'

Digitized by Google

Thus solicited, Carl narrated to me the following touching tale.

They had been brought up together, he said, from childhood, and what wonder if they became all in all to each other. He knew he was not worthy of her, and that Ingebræt would never give his daughter to him — a common farming-man. But he would make himself worthy of her; and so he studied hard at his books, and with the help of the good pastor, had hoped to be able to take a post as schoolmaster (an office held in great respect among the peasantry). But it was all in vain; he had no royal blood in his veins; and neither prayers nor entreaties could move the stern old man from his purpose of wedding his daughter to one of the same family with herself. 'Then,' said Carl, 'I was miserable, and thought I had better leave the world as quickly as I could, for there was nothing in it worth living for now. But she came to me, just as I was about to'—— and his voice failed as he came to this part of his story, 'and promised to share weal or woe with me, and in a weak moment I consented. And now—now—she is made as wretched as myself; and I—I alone am her destroyer.'

Words would fail me were I to attempt to describe the scene that followed the conclusion of his simple but touching tale; indeed, I was so moved myself at the distress of the two young people, that it is best to draw a veil over it.

'But where has the child been all this while?' I inquired.

'Here, sir!' answered Carl. 'I built this hut, and Ingeleiv and I take it in turns as we can to be with it.'

'And how far is this from your father's house?' I inquired of Ingeleiv.

'About three miles; but Carl has twice that distance to go;' and the tears rolled fast down her cheek.

'You see, sir,' added Carl, 'as yet during the summer we have been able to manage; but now that the days are becoming shorter and shorter, and winter is coming on, God above only knows what will be the end of it.' And here Carl followed Ingeleiv's example, and cried like a child.

'Well, cheer up, my friends; I'll do what I can to help you; but you must agree to act according to my directions. Let us wait till to-morrow, however; it is too late to think of doing anything at this late hour.' So spreading my rug down on the ground, and making a pillow of my knapsack, and lighting that unfailing source of consolation, a good cigar, I lay down and smoked, thought over the best plan to be adopted to make things smooth, and then fell asleep.

Next morning, we all set out for Ingeleiv's house. I need not say how surprised my old friend was to see me return so quickly.

'What! you couldn't leave the salmon then?' he said.

Meanwhile, Carl had taken the child, and loitered a little behind on the road, while Ingeleiv slipped into the house unobserved.

'Yes,' I said, entering the house; and then after a few commonplace remarks, I led the conversation to a topic on which the old man never wearied of hearing himself or others talk—namely, the old kings of Norway. But I was determined not to humour him to his full bent this time; for when he got on his favourite hobbyhorse, it was difficult to stop him; so I turned the conversation to hard-hearted parents and ill-assorted marriages, and told him about Philip of Spain, D'Agueseau, and others; and then, when I saw I had made some impression—for the old man received any historical fact, especially when it related to the great of the earth, with implicit confidence—and had excited his curiosity, I concocted a little history exactly similar in all respects to that of Ingeleiv and Carl; and when I had concluded, I took down two books from the book-shelf, which gave evident signs of having been well studied.

'Here, Ingebræt,' I said, taking up one—it was his favourite book—the *History of the Kings of Norway*—'here is a book which tells you all about the lives and deaths of royalty; but here is a book' (it was the Bible) 'which teaches us that in God's sight, who is King of all kings, we all are equal. Humility, forgiveness, and love are the lessons it teaches us.' And then running out of the room, and fetching back the infant in a trice, I laid it in his arms, saying: 'And there is your daughter's child, Ingebræt, and it prays through me that you will not repulse your own blood from you; remember, too, that the blood of old Harald Haarfager is flowing in its veins.'

It was a strange way of breaking news, dear reader, you may perhaps say; and you are quite right. But still I think it was the most effective way I could have adopted. That last touch about the child being of royal descent was, I have ever since thought, the most masterly and diplomatic thing I ever did in my life. A death-like paleness came over the old man's face. I felt it was a critical moment, and I did not keep silence. Never, I am sure, did I talk so fast, beg, pray, or entreat so hard as I did then. At last he began to relent; for at first he was all for driving his daughter out from home and hearth. Not that he would have done it, I am sure, for he loved her dearly. But by degrees, when the first shock was over, and when Inga had thrown herself down on the floor, and had embraced his knees, begging for mercy for herself and helpless babe, the rigid muscles of his face began to quiver, and he burst into tears.

'Nothing like a good cry,' I thought to myself, as I hurried out to fetch in Carl; 'it does man and woman good when practised in moderation.'

Carl was not slow to follow Inga's example; and at last, when I fairly saw the baby still in the old man's arms, while Inga and Carl were at his feet, I thought the tableau did not require the addition of myself, so I retreated and had a pipe over it. How fragrant that pipe of tobacco tasted! for had I not made peace—had I not brought joy to two sorrowing hearts?

Going away next day, or the next, or the next to that, was quite out of the question. I was obliged to complete what I had begun; so I spent my time till the wedding-day, fishing and shooting, and otherwise amusing myself, happy in the consciousness that I had at last really done a good thing in my life.

I was Carl's best man! What a wedding-dinner we had!—and what speeches! Of course my health was drunk; and if only Carl had not dwelt too much on my extraordinary virtues, I should have said he had made a most *apropos* speech for a bridegroom.

I often go to see my old Norwegian friends and to fish. The old man has gone to his fathers; but

Carl and Inga, and a whole tribe of olive-branches, look for my coming regularly when the salmon begin to run up the river.

FROM THE 'WILD COAST.'

In a corner at the north-east of South America, lies a territory full of interest, fabulous, romantic, historical, and actual—a small territory in comparison with the immense tracts which lie above, beneath, and to the westward of it; but richer in mysterious conjecture, in association, and in record of human endeavour, than perhaps any of them. Most curious in the diversities of the race of man, in the ethnological problems it offers, which are apparently hopeless of solution, and in the marvellous revelations of superstition which have been made to travellers who have examined into the condition of its Indian tribes.* This territory is the province of Guiana, divided into British, Dutch, and French possessions—'the mighty, rich, and beautiful empire of Guiana' of Sir Walter Ralegh, 'the Wild Coast' of the Dutch explorers; the land longed for, dreamed of, sought as El Dorado. All that was most beautiful and desirable was to be won in that distant land, at the price of encountering all that was most terrible and revolting. The fabled subterranean kingdom of the *Arabian Nights*, where the treasures of gold and of jewels, of light, wisdom, and immortality, were guarded by dread creatures of preternatural strength and subtlety, found a real counterpart in the country of the Wild Coast, where the great savannahs were the home of monsters, awful to look upon, of great strength and ferocity, who ate human flesh. The beautiful, fanciful fable of the empire of Guiana and its founders the Incas, vanished before the Dutch occupation; but the three centuries and a half which have elapsed since Vasco Nunez discovered it, have not sufficed to reveal the story of its savage inhabitants, the original 'noble savage'—the famous Carib, of continental and island celebrity. Since the time of Sir Walter Ralegh, whose fiction so far outweighed his facts that small reliance can be placed upon his statements, the chief exponents of this wonderful region have been Schomburgk and Humboldt, who differed in their interpretation of those curious remains of antiquity, the sculptures on the rocks in the interior of Guiana, which closely resemble those existing in the islands. However it is to be interpreted, or whether it will ever be, the fact exists, that many inland tribes of the southern continent speak the island languages, while the tribes who occupy the coast, and who would naturally be supposed to have been reached by the islanders, do not. Mr Brett suggests that 'the island Caribs have been an offshoot from a common parent stock, once settled in Guiana, but long since broken up—the same perhaps which carved the sculptures on the rocks in the interior, which hieroglyphics the Caribs, in their migrations, would naturally imitate.',

Of all savage tribes, the Caribs have been the most interesting to speculate about, from the time when, in their discovery, and in the ascertaining of their being cannibals, the Elizabethan people believed they had found the interpretation of the classical legends of the Cyclops, to our own days, when the ingenious Mr Barham suggested, as disposing of personages no longer required, that

> Some got shot, and some got drowned, and some, beyond the seas
> Got scraped to death with oyster-shells, among the Caribbees—

a consummation which recurs forcibly to the memory when one reads Mr Brett's account of the finding of several tumuli far inland, composed of quantities of shells, and human bones, broken in pieces, evidently that the marrow might be conveniently eaten out of them. It is only just to the modern Carib to state, that though still a savage of a low and ferocious type, he is not a cannibal, and he dislikes being convinced of the cannibalism of his ancestors, always endeavouring to make out that it must have been some other tribe who ate the Caribs, even though that theory implies the admission of conquest. It is very pleasant to read about British Guiana, to know that if it does not keep pace with the Dutch settlement, it is at least much more prosperous and important than the French, to which the ugly and opprobrious association of a penal settlement attaches; and the list of natural products is important. It is also pleasant to learn with what patience and perseverance missionary enterprise is being pushed forward in the British territory, whose coast-line is two hundred miles in length, and which extends far into the interior, to the border of Brazil. The success of the missionaries in introducing Christianity does not seem to be very brilliant, but they have introduced clothes, some faint notion of morals, and a few kinds of industry, which sensible people will regard as the best and most promising beginning. Before Mr Brett takes his readers into the interior, among the Caribs, he describes Georgetown, the capital, on the Demerara, and gives them a glimpse of a society, than which there can hardly be any in the world more strangely constituted. In the streets, with canals on either side, and with gardens around the houses, shaded by the cocoa-nut and the cabbage-palm, may be seen busy groups, composed of the native Americans, of Europeans of all countries, but the Portuguese most numerous, of coolies from Calcutta and Madras, and Chinese from the far, far East. There they are, in their various costumes, speaking their different tongues, moving about among the bulk of the population, which is of course Creole. A babel of tongues, even without the addition of the languages of the aborigines; a confusion of nations, the worst practices of heathenism, the prevalence of the Hindu and Mohammedan creeds, together with the eastern

* *The Indian Tribes of Guiana, their Condition and Habits, with Researches into their past History, Superstitions, Legends, Antiquities, Languages, &c.* By the Rev. W. H. Brett. London: Bell and Daldy.

Digitized by Google

costumes, give the whole place an oriental character, and makes the field of missionary labour as difficult as it is expansive. But we see all this elsewhere, if less strikingly; the aborigines are what we do not see, and what we want to see; and the way to them, in their wild haunts in the interior, lies through a country which might indeed well inspire the poetic fancy, the gorgeous visions, and the illusive hopes of the dreamers of El Dorado.

The way lies through splendid forests, which commence at the edge of the sea, and stretching across the plains, climb the sides of the rocky mountains of the interior. Magnificent timber-trees—the green-heart and the purple-heart, the stately mora, the locust-tree—rear their grand heads above the smaller kinds, beneath which, again, from a moist carpet of fallen leaves, moss, and fungi, springs humbler vegetation in rank luxuriance. Palms of numerous kinds lend their special beauty to these forests, and beautiful parasites abound in them. As for the animal life, Mr Brett says: 'He who would see the beasts and birds must arise from his hammock with the dawn, and go with the Indian, through the bush dripping with dew. The jaguar, having completed his nightly prowl, is retiring to his lair; the red howling monkey is uttering less terrible cries, beginning to tire of his own noise; the birds and smaller animals are coming forth to feed; and everything teems with life. High overhead, green parrots of various species, numerous and noisy as rooks, are flying to their feeding-places. Macaws, blue and yellow, or blue and crimson, occasionally shew themselves; and in the higher regions is seen the magnificent ara, with plumage of brilliant scarlet, set off with tints of purple and gold. The toucan displays his gorgeous red and yellow bosom, and tosses his enormous beak with fantastic jerks on the top of the highest tree. The hannaqua and duraqua, the marudi and the maam; the stately crested powis, with jet black feathers and yellow beak, and many others may be seen. Least in size, but not in beauty, are the various species of humming-birds, flitting hither and thither like bees, and flashing in the sun like jewels. Insects, beautiful or otherwise, creeping and flying, abound; and the coushi and wood-ants swarm, for ever ingeniously busy. But the heat increases, and the birds seek shelter; the intense stillness of the forest sets in, to be dispelled by the evening, when the world of bird and beast bestirs itself again. Then comes night, and new silence, broken by the croaking of frogs, the cry of nocturnal birds, the chirping of insects, and the sound of the vampire and other bats in their nocturnal flight.'

The tapir, the deer, the bush-hog, the labba—which, being delicious food, is mercilessly hunted—the sloth, the opossum, many kinds of monkeys and ant-eaters, the armadillo, and the coati-mondi, abound in the forests; while in the deepest glades there is always the possibility of meeting the ocelot, the puma, and beautiful spotted jaguar, and even the black variety, the rarest and most feared of all, the animal which has not only real but superstitious terror for the Indian, in whose legends it plays the part of the wehr-wolf of Germany, the loup-garou of France. 'Although,' says Mr Brett, 'the spotted jaguar is a beast of prey, it is impossible to gaze without admiration on his rich glossy skin, as the sunbeams fall on it through the opening in the tall trees caused by the stream. He will not, however, allow you much time for observing the black spots, disposed in rings or rosettes on his tawny hide, as he generally retreats after gazing for a few seconds at the intruding party, often looking round, as he glides off with noiseless step, and bounds carelessly, and without the least apparent effort, over the fallen trees which may lie in his path.' Through these beautiful forests, by mighty rivers, of which the Essequibo is the largest, with their numerous tributaries, and their rushing cataracts and rapids, the traveller journeys in quest of the traditional Caribs, along the shores of lakes which abound in fine fish, but likewise in alligators, and otters so daring that they will follow his canoe, and bite at the steering paddle.

There are no roads through the forest save the foot-track of the Indian; to reach the aborigines, at home in the woodlands, to whom the visitor seems an awkward, bungling, helpless creature, one must ascend the rivers. The Caribs are found at the upper part of the Pomeroon, where they occupy a large tract of rich and beautiful country. The women of this traditionally interesting tribe are exceedingly ugly, and barbarous in appearance. Mr Brett thus describes the first group of them he saw. 'Their dress was merely a narrow strip of blue cloth, and their naked bodies were smeared with the red arnotto, which gave them the appearance of bleeding at every pore. As if this were not sufficiently ornamental, some of them had endeavoured to improve its appearance by blue spots upon their bodies and limbs. They wore round each leg, just below the knee, a tight strap of cotton, painted red, and another above each ankle. These are fastened on while the girl is young, and hinder growth by compression, while the calf, which is unconfined, appears, in consequence, unnaturally large. But the most singular part of their appearance is presented by the lower lip, which they perforate, and wear one, two, or three pins sticking through the hole, with the points outward. Before they procured pins, thorns were worn.' The men, though they also smear their bodies with the arnotto, are not so hideous as the women, and they are certainly a brave and sensible race, skilful and indefatigable hunters, and capable of hard work, which few Indian tribes are. They are of an imaginative and enthusiastic temperament, as was abundantly proved by the readiness with which they fell victims to a remarkable imposture. A person, pretending to be the Deity, went into the interior with several followers, and established himself in the upper part of the Masaruni. From this distant spot he sent emissaries into the neighbourhood of all the missions, calling on the Indians to quit their homes and provision-grounds, and go with him. They were told that they should possess lands which would yield a large crop of cassava from a single stick, and various other absurdities, very alluring to the Indian. These tales, joined to threats of horrible destruction which should come upon all who refused to go, had their influence upon the minds of many, and lured them away,

Digitized by Google

several to perish by sickness on the journey, and others to find themselves in a state of destitution on arriving. The Caribs possess strong family and tribal feeling, and though they emulate the external impassiveness which is so highly prized a characteristic of the savage, Mr Brett does not consider them unfeeling or unemotional. The description he gives of the Christian Caribs is eminently satisfactory, and it is evident that the heathens are above their neighbours in intelligence. Of one tribe, the Waraus, he gives a truly deplorable account. They are in the last and lowest category of degraded human nature, and in comparison with the other American tribes, what the Gytch savages are, in comparison with the other tribes of the Nile.

The Caribs suffer much from epidemics, and from several severe and painful forms of skin disease. Like all Indians, they believe sickness to be the result of sorcery, and are at the mercy of their medicine-men. They suffer patiently and haughtily, and it is difficult to induce them to believe in or try any foreign remedies. They have a frightful custom of hereditary revenge, which resembles, in principle, the *vendetta* of Corsica, and in the mode of its carrying out, Thuggee. Slavery and its accompanying vices are thinning their numbers; but it does not appear from Mr Brett's narrative that any of the customary cruelties of European rule have been inflicted upon them by the English, the French, or the Dutch. Their superstitious and social practices are very curious, occasionally suggesting a resemblance to those of the Chinese. Mr Brett has seen a Carib lying in his hammock, and receiving most ludicrous and unpleasant attentions from the women of his tribe, on the occasion of his wife's confinement, while the mother had to exert herself as usual. When the birth of an infant is expected—which, as they are polygamists, is by no means rare—the father must abstain from certain meats, his eating of which would be injurious to the child. The *agouti* is tabooed, lest, like that little animal, the infant should be meagre; the *hamiara* also, lest it should be blind—the outer covering of the eye of that fish being filmy; the *labba*, lest the infant's mouth should protrude like the *labba's*, or be spotted like it, which spots would ultimately become ulcers; the *marudi* is also forbidden, lest the infant be still-born, the screeching of that bird being considered ominous of death. The Indians believe in the immortality of the soul, and in the invisibility of God—in this sense, they are not idolaters—and they have quite exalted notions of the *power* of God, and some idea of His *goodness*, in which they are far superior to the African savages. But, like them, they live in perpetual dread of the agency of evil spirits, and in constant striving to avert calamity by propitiating them. The sorcerer's being the most important and honourable profession within the reach of the Indian, it is not unfair that he should be obliged to endure some pain and unpleasantness to qualify him for it.

Mr Brett's account of the initiation is curious. 'When an Indian,' he says, 'has made up his mind to become a sorcerer, he applies to some professor of that art, who takes him into a small hut prepared for that purpose. After certain preliminaries, including solitude and spare diet, a quantity of water, containing about ten leaves of cured tobacco, is boiled down to about a fourth. This horribly nauseous and emetic dose he must swallow: and in the death-like state of sickness to which it reduces him, his spirit is supposed to leave the body, and to visit and receive power from the Yauhahu, as the dreaded beings are called, under whose influence he is supposed to remain ever after. Meanwhile, his death is loudly proclaimed, and his countrymen are called to witness his state. Recovery is slow; and the tenth day he comes forth from the sacred hut in an emaciated condition. For ten months after, the new sorcerer must abstain from the flesh of birds and beasts, and only the smallest kinds of fish are allowed him. Even cassava-bread is to be eaten sparingly, and intoxicated drinks avoided during that period. Meats and food not indigenous to the country are especially tabooed. I have known one of these men refuse to pick up some North American salt-fish which had fallen on the ground, lest by touching it he should neutralise the power of his enchantments. The sorcerers are furnished with a large gourd or calabash, which has been emptied of its seeds and spongy contents, and has a round stick run through the middle of it by means of two holes. The ends of this stick project—one forms the handle of the instrument, and the other has a long string, to which beautiful feathers are attached, wound round it in spiral circles. Within the calabash are a few small white stones, which rattle when it is shaken or turned round. The calabash itself is usually painted red. It is regarded with great awe by the heathen Indians, who fear to touch it, or even to approach the place where it is kept.' Wonderful as such degradation seems to us, in the people who believe in these sorcerers, the apparent belief of the sorcerers in themselves is still more wonderful; but this Mr Brett does not doubt—they perform all their juggleries over their own children, and have all the incantations gone through over themselves when they are sick.

The Waraus, most degraded of tribes, are the most renowned as sorcerers. The huts which they set apart for the performance of their rites are regarded with great veneration. A traveller, visiting a Warau settlement, entered one of those huts, not being aware of the offence he was committing, and found it perfectly empty, with the exception of the gourd. There was in the centre of the hut a small raised place about eighteen inches high, on which a fire had been made for burning tobacco. The sorcerer being asked to give up the gourd, peremptorily refused, saying that if he did so, his 'two children would die the same night.' The most imaginative of their superstitions is that concerning the Orchu, an important person in Indian mythology. She is a mysterious female inhabiting the waters, not so malignant as the Yauhahu, but very capricious, and much dreaded. Her form is that of a mermaid—according to the European fancy; but she sometimes assumes the head of a horse, or of some other animal. She often amuses herself by merely terrifying mankind; but sometimes bears both canoe and people to the bottom. The Indian belief in this creature is shared by the immigrant negro tribes, who call her the 'water mamma.' In their mythology and legendary tales, one Sigu figures largely—a colossal hero, whose doings are not altogether unworthy of admiration. 'Unlike the aborigines of Hayti,' says Mr Brett, 'whose patriotic vanity led them to believe that their

Digitized by Google

island was the first of all things, and that the sun and moon issued from one of its caverns, and men from another; the tribes of Guiana acknowledge the immediate work of a Creator. Among those near the coast, the belief formerly prevailing was, that 'the Great Spirit, having created the heavens and the earth, seated Himself on a huge silk-cotton tree by a river-side, and cut off pieces of its bark or wood, which he cast all around. Those which touched the water became fishes; others flew in the air as birds; while some, as animals of various kinds, and lastly, man, moved on the earth.' To this very ancient legend, additions have been made during the last three centuries. According to one of these, the white race sprung from the branch of a certain tree, which the Great Maker cast upon the water. 'There is in this a little quiet satire, as the tree from which the branch was taken is of little or no value.' These and the many strange, and in some instances poetical, fancies narrated by Mr Brett, still flourish in the far interior, and in the swampy regions stretching towards the Orinoco, and are carefully transmitted by these remote people, who have no other lore. They are, however, rapidly dying out among the Indians who are brought in contact with civilisation. Such of the Carib women as have embraced Christianity have taken to wearing clothes with much readiness, and seemed at first to think they never could wear enough; while the men developed a tendency to wearing shirts—keeping the soiled one under the clean—and very brilliant flowered waistcoats. As they did not adopt any other portion of the garb of civilisation, the effect was more peculiar than pleasing.

On the whole, Mr Brett makes one rather like the Indians of Guiana; but he does not clear up the mystery of their early history; nor does he think it ever can be cleared up. The discoveries made by himself and others indicate unmistakably that great changes, without any traceable influence having been brought to bear upon the frightfully barbarous tribes of the interior, must have taken place. Cannibalism, for instance, which was indubitably a universal custom, no longer exists, and the Indians, as we have said, are ashamed and distressed at its discovery. The most archaic forms of weapons have been replaced by graceful and efficient ones of native invention and manufacture. Are these things evidences of an inherent law of progress and development? or were they suggested by invasion, by intermixture of race, of which there is no record, written or graven? A dense cloud hangs over the origin of these tribes of Guiana. Mr Brett thus summarises their history, as far as it is known: 'In the sixteenth century they appear before us; the Caribs and fiercer tribes attacking, and the others fleeing, or defending themselves as well as they are able; while the practice of enslaving each other seems to have generally prevailed. In the course of the next century, we see them chiefly engaged in resisting the encroachments of a fairer and stronger race, which arrived from various countries of Europe with more destructive weapons. In the eighteenth century, while still enslaving each other, we find them frequently engaged by the side of the white man in deadly contest with the black.'

The middle of the nineteenth century beheld these various conflicting races united in peace. Judging from the rapid decline of their numbers, and the continued prevalence of the causes of that decline, it does not seem unlikely that there will be no Caribs by the middle of the twentieth century. Apart from the consideration that the people of that time will not have the chance of reading so pleasant and interesting a book as Mr Brett's, perhaps the extinction of the traditionally unconquerable aborigines of Guiana will not be to be deplored.

THE PROBLEM.

Her life is all one neutral tint;
A cold and quiet gray;
No thunder-cloud nor sunbeam glint
Darkens or cheers her way;
No great events their shadows cast
Across her Present or her Past.

From year to year she patient sips
The tasteless cup of life;
No annals e'en escape her lips
Of blighting care or strife;
And rarely from them falls one word
That would be worthy to record.

She is not old—she is not young—
She works from day to day,
Nor cares for those she dwells among,
And hers—the neighbours say—
A nature neither warm nor cold,
Too soft to carve—too hard to mould.

And yet her face has saddening power,
I seek the cause in vain—
As sometimes, at the twilight hour,
A misty, treeless plain,
With drearier feelings fills the heart,
Than scenes of strife or storm impart.

Kingdoms might fall, and empires quake,
Nations rejoice and groan,
And in her breast no interest wake,
Yet surely I have known
A sound, a scent, a trifling thing,
Search out some memory's hidden spring;

When, slowly rising to her eye,
I see a faint light glow,
And then—I know not how or why—
It must be long ago—
By that pale gleam I read the cost
Of a life's welfare staked and lost!

CO-OPERATIVE HOUSEKEEPING.

Is this a new term in England? There are many other designations in which the word 'co-operative' takes part—such as co-operative production, exemplified in the cotton and woollen mills owned by working-men in Lancashire and Yorkshire; co-operative mining, known in principle, if not under that identical name, by the tin and copper miners of Cornwall, and by a few among the coal-miners of the north; co-operative land-buying and house-building, familiar to the members of land and building societies; co-operative money-lending, usually combined in some way with the operations of these same societies; and co-operative stores, for (professedly) buying retail at wholesale prices, as the Pioneers of Rochdale have done successfully for many years past, and as many families in the metropolis are now attempting to do. It matters little, however, whether the name co-operative housekeeping be new among us; the interesting questions are: What does it mean, and is there any good in it? An American lady has recently sketched a plan on the subject, developed to a certain degree of completeness—not in the 'Woman's Rights' tone adopted by so many of her countrywomen, but in a plain and sensible manner. She does not afford us the means of mentioning her name, seeing that the scheme has been treated partly in a small book or pamphlet published anonymously, and partly in the pages of one of the most widely circulated American periodicals.

It is in reference especially to the state of society across the Atlantic that this scheme has been brought forward; but many points present themselves as data for comparison between the two countries. The lady-writer looks with much anxiety at the position of her countrywomen. Be the cause what it may, be the fault where it may, American women in the well-to-do classes have an insufficiency of employment. As, in England, club-life takes men away too much from their families (in the estimation, at least, of the families themselves); so, in the United States, does hotel-life prevent the formation of those social domestic habits which form the charm of the family circle. American ladies, daughters of mercantile and professional men, are nurtured very delicately, and are chivalrously protected from all the harder and sterner experiences of life. The same thing, to a large extent, prevails in England, but (so far as evidence goes) not to so great an excess. The writer states very decidedly that one consequence of this is, the encouraging a habit of expensive dress; a young man finds such a wife a very costly treasure; and, as a consequence, other young men delay marriage to a late period, or do not marry at all. It is the *Saturday Review* over again, the Materfamilias of the *Times* over again; only, in this instance, the writer treats mournfully and affectionately of her own countrywomen—urging *them*, rather than the men, to bring about a more healthy tone of affairs. What English families think of American hotel-life, is to some extent known to most readers; what this American lady thinks of English club-life, is sufficiently denoted in the following impassioned words: 'The English club-house, stronghold of intensest egotism, built of women's hearts, and cemented with their tears—the living tomb of love.' As to the dress question, this lady says: 'A woman cannot dress with mere neatness in these times under two hundred dollars a year.' Now, this is equal to about forty pounds. Would English ladies assent to this statement, so far as they are concerned? There are, we are told, two million women in the United States whose social position would claim for them the designation of ladies (in a country without a titled or hereditary aristocracy); and among these two millions are a formidable phalanx reared elegantly, dressed expensively, and very little employed in any useful pursuits.

Other suggested modes of social and individual improvement we pass over here, in order to notice one of very remarkable kind, sketched by the lady-writer to whom we are referring. Let not a reader at once pooh-pooh it as absurd and impracticable; for, in the first place, its failure could only be

Digitized by Google

proved by actual trial; and, in the second place, it is primarily intended for America, where many phases of society present themselves, little known in England. The purpose held in view is twofold—to economise a little in housekeeping, and to give women—especially the wives and daughters of commercial and professional men—an incentive to more active and useful employment than at present. It is a scheme for co-operative housekeeping, for applying to family wants and family duties the principle that underlies the co-operative system generally. Not—as in the schemes of Robert Owen, Fourier, St Simon, Cabet, and other dreamers—that families are all to live together under one roof, and share everything in common; they are only invited to lessen the cost of food, fuel, cooking, dress, sewing, washing, &c., by adopting the organised instead of the piecemeal plan.

This is how it is to be done. Women are to do everything connected with the matter, as far as possible; seeing that an improved employment of women's time and thoughts is one of the objects in view. Wives may be considered to have no capital, apart from their husbands; and both household duties and social prejudices might seem to militate against the adoption of anything like a trading scheme by the mothers and matrons of families, or by a wife with no purse to study but her husband's. These difficulties it is sought to overcome. What the bread-winner gives to the housewife, to support the weekly expenses, is to be made to go further and to do more than at present. How curiously is the whirlwind of American life depicted in the following words! 'Our husbands and fathers are already overworked in this mad American rush of ours. They cannot stop to mend the holes made in their pockets by the relentless family expenses.' And the other sex is invited to come to the rescue: 'The wives and daughters who enjoy the fruits of this thought and toil can do it for them most daintily, if they will only lay their white hands together, and give to it a few hours of every day.'

We are invited to suppose a case where, in any town or district, a considerable number of women, wives and daughters of families, are willing to form a Co-operative Housekeeping Association. They choose a president and secretary. They draw up a constitution and by-laws; taking as a model, so far as applicable, those of the Equitable Pioneers at Rochdale (a body which has attracted much attention in America), and of some other successful co-operative undertakings in England. The main purpose of the association is to be 'to furnish the households of its members, for cash on delivery, with the necessaries of life, unadulterated and of good quality, and accurately prepared, both as to food and clothing, for immediate use and consumption;' and the secondary purpose, 'to accumulate, from the profits of this sale, capital for each individual housekeeper or her family.' Whatever committees, councils, managers, superintendents, &c. may be appointed, all the offices are to be filled by women—with an exception presently to be mentioned. They are not to become traders, except among themselves. The association is to sell only to members; and a rigorous system of ready-money payments is to be adopted. Not only is it contemplated to sell food-materials and dress-materials, but food ready to eat, and dresses ready to put on; because the hope is, to save expense, loss, waste, trouble, and annoyance in cooking, laundry-work, sewing, and servants. The authoress mentions a fact, or rather puts forth an estimate, which may possibly serve as a means of comparing family expenses in the two countries; to the effect that, 'in town and city families, twelve hundred dollars (about L.240) a year pass through the hands of the mistress for food, fuel, servants, and dress.' Every English reader will be able to determine for himself what kind of establishment this would denote in our own country, and what amount of total income would be required by the husband or head of a family living in this mode. In America, it is said to denote 'a family living with moderation and economy.' The authoress insists (and indeed it is her main purpose to shew) that a system of co-operative housekeeping might be made to effect large savings in all these four items—food, dress, servants, and fuel for cooking and washing.

The association is to sell at a fair profit, analogous to that realised in ordinary trade; and not at cost price. This is advocated on the ground that the profit, when shared among the members periodically, will be more availably useful than if it came in daily driblets; and because experience has led to a similar result in England. The association 'will accept no voluntary labour, but will, as far as possible, fill its offices with its own members, or their female relatives and friends, at fixed salaries.' So far this is consistent with one of the avowed objects of the movement; but the authoress urges that her sex shall not be ranked lower than men, unless there be a good assignable reason: 'these salaries, as well as the wages of all its clerks and servants, shall be the same as would be paid to men holding similar positions.' She thinks it necessary gradually to remove the prejudice that 'ladies will not work for money;' and this is one of the means to effect the removal. Once again, we must, throughout these observations, remember that America is the country held chiefly in view.

It is to be one of the rules of the association that any housekeeper may be received as a member, and that all the members shall be equal in the eyes of the association. Let us not run away with the idea that democratic America is democratic in everything. 'Women,' we are told, 'being at present essentially aristocratic, many may demur to this article, as tending to introduce into their companionship those who are not of their own set.' But this, it is urged, is a feeling which must not, cannot, be introduced in trade. 'In business, social distinctions are not recognised. Money is money, whether it comes from the poor or the rich; and if a mechanic's wife wishes to be a co-operative housekeeper, though she may buy less and simpler food and clothing than a broker's or a lawyer's wife, yet, if she pay as punctually for it, she has as good a business standing in the association as they.' There is also the consideration that, in *making* and *doing* (part of the services paid for by women to women), the women of the middle and humbler class would be directly needed. As much as possible, all employed would be members, and all members would be employed. In order to insure that wealth shall not drive out the humbler element, each member shall have only one vote at the general and committee meetings of management.

Of course there must be a little capital to start

Digitized by Google

with; and this is provided by weekly payments from every member, up to a certain amount, which shall be regarded as the value of the share. When the trading has been going on some little time, the accounts are to be balanced quarterly. Let us suppose (1) that there is a loss (which would seem to denote bad management in some quarter or other); (2) that there is a small profit; (3) that there is a moderate profit; (4) that there is a large profit. If there is a loss, the members must bear the loss among them, by paying up a small addition for each share; in order that the working capital may not be reduced below its original amount. If there is a small profit, it will be divided among the members as far as it goes. If it reaches a certain average, moderate, or expected amount, it will bear a definite ratio to the money price of each share, like a definite amount of interest on capital. If the profit goes higher than this, then the large purchasers will begin to reap an additional benefit; for, after the fixed rate of dividend or interest has been provided for, the surplus will be distributed according to the largeness of the purchases made. A lady has no more voting power than a humbler housekeeper; but as her purchases are likely to be larger, she will find a proportionate benefit whenever the profits of the association are good.

But amidst all these details about profits and dividends, what are the things bought and sold, and how are the buying and selling to be managed? The main departments of household economy to be attended to are dress, washing, and cooking, including the wherewithal for those important matters. There are to be three committees, superintending these three departments. The dress department (if the association be tolerably large) will comprise a store, a fitting-room, a sewing-room, &c. A stock will be kept, comprising all the principal materials for women's and children's clothing—to such an extent, and of such variety, as the committee may from time to time deem best. In the sewing-room there will be needlewomen, with or without sewing-machines. These women will, as much as possible, be members of the association, receiving pay as workers, but at the same time having a share in the management and in the profits. If they consent, they will all dress alike, and will be provided with comfortable dinners and teas in the cookery department of the establishment. It points to a noticeable difference between England and America, in regard to young women engaged in workrooms and factories, that provision is to be made for gymnastics or calisthenics, as a corrective of some of the evils attendant on too close plying at the needle. Young women in America indulge in more dancing than their own class in England; and the store and workroom are to be occasionally cleared out for a ball.

The co-operative laundry can, it is admitted, be managed more easily than the co-operative dress department, because there is less diversity in tastes and in processes. The same is not the case, however, in the co-operative kitchen. Here our authoress confesses that the chief difficulties will have to be encountered. But she regards these as difficulties to be conquered, not to be succumbed to. She says we must consult all the hotel plans, restaurant plans, public-dinner plans, cheap-cookery plans, &c. adopted in the chief European towns; and she merrily adds, that 'it will be hard if Yankee brains cannot invent a "Universal Heat-generating Air-tight Family Dinner Box."' Perhaps she is not aware how remarkably near M. Sörensen's curious Norwegian stove approaches to this character.

Men-folk are to have a *little* to do with the Co-operative Housekeeping Association. There is to be a council of the male heads of families, to assist in the larger financial matters, and to advise in difficult questions. The mistress of a household cannot, must not, become a member without the sanction and approval of her husband—this is set down as a *sine qua non*. 'Being our governors, no such enterprise as co-operative housekeeping could be started or sustained without their sympathy and consent; and as they have now the power of veto on our housekeeping arrangements by virtue of being also our bread-winners, so, as their funds alone would sustain co-operative housekeeping, they should have the same power there. We should simply have to trust, as we do now, that our reasonableness and good judgment and study to please them, would in general be such as to shield us from blame and reproach.' A change in the laws relating to the property of married women would have much to do with the form which such an association might eventually assume.

Co-operative housekeeping may or may not be suitable to England; but it is certainly brought forward in a sensible, womanly, and thoroughly honest spirit.

KITTY.

IN THREE CHAPTERS.—CHAPTER I.

THE Combe was a delicious old farmhouse, all red brick and rich green ivy, nestling low down amidst the warm soft hills of Midlandshire.

To call it a farmhouse, however, hardly gives an idea of what it was. Approaching it from the back, by the poppy-edged path through the cornfields, and down the daisy-covered hill-slope that brought you right upon it with a run, it *was* a farmhouse. There were accurate haystacks reared about it; there were tidy pig-sties and cow-houses, and cart-sheds and long low barns; and there were the deep utterance of the kine in their comfortable shelter, and the impertinent cackle of turkey-cock, and goose, and fowl. But approaching the Combe from the front, it would never have been known as a farmhouse at all. Its little diamond-paned windows peeped out upon a broad lawn, edged with laurels, and box, and daphnes, and studded here and there with a copper-beech, or a cluster of dark pines; it had a broad carriage-way leading up to the house-door; there were seats upon the lawn under the spreading trees; its window-sills were filled with blooming and scented plants; and everything was so bright and smooth it might have been a small mansion, or a gentleman's quiet country-seat. But it *was* a farmhouse for all that, only a very prosperous and well-regulated one.

Attached to this delightful, cosy Combe was a vinery; a broad, aslant-roofed, old-world thing, glistening and scorching in the sun under the south wall; and in this vinery were the Combe's master, Michael Courtney, and Kitty, his one daughter and only child. As the two stood together under the slope of sunny green leaves

Digitized by Google

and purple fruit, they did not look like father and child at all. Mr Courtney was bent and shabby, and looking lost or scared, in his rough, gray, country-cut clothes, that would have assumed his shape when he was out of them, so long had they been worn upon his great wide form; Kitty was in a charming morning-dress, that had no fold upon it but those given by laundress and *modiste*, and she wore it with such ease and prettiness of demeanour, as gave perfect assurance she could accommodate herself to silks and jewels, and 'society,' every bit as well. Old Michael looked hard-worked, unwieldy, poor; Kitty had litheness, and grace, and beauty, with *l'air* of having never done anything in her life at all. So as they stood side by side in the tinted sunlight, unless heed were paid to what the two were saying, and to the manner in which they said it, the tie that bound them could never have been guessed. Every word of their little history would have had to be told.

'Never mind, pap,' were Kitty Courtney's words. This was her baby-name for papa, and it was the one still most frequently on her lips. 'It is no matter, dear. Come with me.'

'I can't, Kitty,' said Mr Courtney; 'I can't, I can't;' and though his daughter was touching his arm to persuade him to come away, he did not yield to her, but put his hand up to his forehead, and rubbed it with a sort of testy despair. 'I must,' he said again, in difficulty and in trouble; 'I must—I must—see if it will grow!'

'Next year, pap, dear, perhaps,' Kitty soothed him, and smiled out. 'We will come and look at it again, by-and-by. Come out into the garden now. It is too hot to stay long in here. Come, dear; come.'

Then one can understand, as Kitty tries again to win her father away, that this is only the memory left to her of the great active man whose voice was round and cheery once, whose hand was sure at his gun, whose saddle was as often his resting-place as his chair. Then one can understand that this is but the ruin of bright friendly Michael Courtney. The ruddy skin is soft and white now; the hand never gets its aim; the eyes are dulled; and there is a look upon the face that means that something has been taken from it, and that its trouble and distress must ever rest there, whilst that something remains away. But there is the love left for what the dear father has been; there is the great pity for what he is now; and with him, on his side, there is the flickering recollection of the old life, the old pursuits, making all novelty distasteful, and leading him to linger in the greenhouse this sunny morning, with the anxiety only of the occupation that was his pleasure in years gone by.

Kitty could not induce him to go now. She tried again, with the pleasantry she would often break into, and that would sometimes win. 'You think a vapour-bath is good for me, pap,' she said. 'You are turning doctor, now mamma is too active to let you continue farmer, and you are forcing me to take what you prescribe. But do come away, to please me, dear. Do let us go.'

'But it *ought* to grow,' said Mr Courtney, rubbing his head still, and worrying himself over a young plant that was sickly, and shewed only a few stunted leaves. 'Why doesn't it? Where did it come from, Kitty? Who brought it?'

'Don't you remember?' asked Kitty. The name she would have to utter was one that always gave her heart a check; and, even before the audience of this dear father, she held back. 'Come, who was it now?' she cried, trying to evade an answer. 'Remember, pap, dear. Think!'

'I can't, Kitty! I can't!' cried Michael Courtney; his hands up despairingly to his forehead, appealing, as it seemed, for memory, just as he would for sight, had he been blind.

Kitty was touched and penitent. 'You shan't try, pap,' she cried. 'I will tell you. It was—it was—Mr Musgrave, from Bracklington House, pap, dear.'

'Mr Musgrave, Kitty?'

'Yes, dear. Abel—Hamilton—Musgrave, of Bracklington—House.'

'But didn't he die, Kitty?'

'Yes, pap; your old friend, the father. But it was—it was—Mr—Mr Abel, the son, who sent the plant. And, perhaps, pap, dear, *it* doesn't thrive because *he* doesn't thrive either!'

'Why, he was very rich, Kitty. I sold him my spotted mare!'

'Yes, *old* Mr Musgrave, dear. But when he died, you know—and it is only two years ago—it was found that he had not so much money as people thought; and young Mr A—Mr—Abel could scarcely keep on the factory, and at last he failed.'

'Ah, I don't remember, Kitty; I had forgotten,' said Mr Courtney sadly. He was conscious still, at times, of his helplessness; and when he was, that made Kitty pity him so very much the more.

'Never mind, love,' she cried tenderly.

'I can remember,' old Courtney went on with his lamentation, 'what happened years ago, but nothing that is going on to-day!'

'Never mind, love,' Kitty answered again. 'What does it matter? When you were young, everything was very pleasant to you; so keep on thinking about it. Don't trouble about what comes now. It isn't nice, pap, dear, at all.'

Mrs Courtney appeared now, and did in one order all that Kitty's coaxing, in all these minutes, had entirely failed to do. She was one of those tall, thin, upright ladies, dark-eyed and dark-haired, with a just distinguishable trace of down upon the upper lip, who are admired for dash and bravery when they are young, but who become somewhat too candid and masterful when they are getting old. She possessed, as all her breed do, small features, which were pretty, and a small head; she had well-marked eyebrows and excellent teeth, with a particularly lax tongue, and a good solid quantity of self-belief. But she was a good creature; an active leader in anything that was right; a thorough abhorrer of everything that was wrong. She was not tender, but she was true; and all honour to her.

'Catherine,' she cried, as she came to the inner vinery-door — no baby-names with *her*—'bring your father to the drawing-room, as quickly as you can. I see the Folletts at the turn of the road, and you must go to them, as I am busy, and chat till I come. Make haste!'

And Mr Courtney suffered himself to be led away by Kitty without another glance or word; and she placed him in his chair by the open drawing-room window, just where his eyes could best fall on the sea of hills in front of him, and where the sun was shaded nicely from his smooth bald head, and then the door was widely opened, and the Misses Follett were ushered in.

Digitized by Google

They were good-natured girls, rather loud-talking, rather loosely made, long-handed, fair-haired, dressed neither in good taste nor in garments of well-assorted colours; but they had a faculty for keeping the neighbourhood alive with picnics, and teas, and dances, and so they had their purpose in their generation, and fulfilled it in a very pleasant way.

Much gossip fell from them about the town of Aberminster, two miles distant, where they lived, and from which they had just walked; and then Mrs Courtney had finished the business that had kept her this short while from them, and came bustling in.

'You have come about the picnic, of course,' she cried directly she had shaken hands and said how do you do. 'Have you fixed what day it is to be?'

Kitty could not resist a little laugh. 'Mamma loses no time, you see,' she cried. 'She is a first-rate economist in other things besides her farm. Only let a social sun shine, and over goes her hay!'

'And why not, Catherine?' asked Mrs Courtney, surprised that her rapidity should be taken for rapidity, or for anything but the proper opposite to sloth. 'I *know* Jane and Sophia would not come out to the Combe without they had something to come about; and of course it is the picnic. I was sure it was the picnic when I saw them on the road; and I am not wrong, my dears, am I?'

'You are quite right, Mrs Courtney,' one Miss Follett said; and 'That was the very thing,' the other Miss Follett said; and then, whilst Mrs Courtney rang for plates and glasses, and they were brought, and she produced and served delicious rice-cake and gooseberry-wine, the visitors made known between them that an early day in the ensuing month had been fixed on, and that the *locus* unanimously chosen for the gathering was the squire's seat, Ashbury Hall.

'Of course the ladies invite the gentlemen,' further made known one of the Misses Follett.

'Of course,' said Mrs Courtney, refilling the young ladies' glasses with her clear gooseberry-wine. 'To be sure!'

'Well, then,' said the other of the Misses Follett, 'we are puzzled about Abel Musgrave. In his case we don't know what to do.'

Kitty was open-tongued in a moment. 'Puzzled!' she echoed, with a quick flush. 'Why, Jinny and Sophy, what *can* you mean?'

'Catherine,' Mrs Courtney interposed, 'don't be so hasty over nothing at all. Jane and Sophia mean, of course, because he has failed. It might not be agreeable to some people to meet him now he has become so poor.'

'Mamma!'

'Well, he *is* poor, Catherine,' the arithmetical Mrs Courtney said. 'All the pity and liking for him in the world cannot alter facts. He is very clever, and pleasant, and considerate, but you can't make money out of *that*, so it 's of no use to try.'

'But the meanness of letting money make any difference!' Kitty in her warm indignation cried. 'At Christmas, when he was laid up with his broken leg, he couldn't visit, of course; but now that he is beginning to get about again, and wants a little cheering, to turn from him, merely because he has lost his money, is a great deal too bad!'

'Mind, I don't say it would make any difference to *me*,' Mrs Courtney began.

'Oh!' cried Kitty, a little bit appeased.

'It was of others I was thinking. But be a little calm, and we will talk it over. Let us see.'

So, whilst the Misses Follett partook heartily of their cake and wine (a walk through two miles of lanes and highways would have given sweet flavour to less dainty fare), a canvassing was gone through of Master Abie Musgrave, and his fate was settled. He *should* be invited to the picnic, the verdict went; whereupon Kitty cooled down a little, although, when the Folletts had finished their visit, and she was walking with them, without her mother, to the Combe gate, she gave them such further fillip for their hesitation as from other lips would have sharply stung.

'How commercial you are, with your weights and scales!' she cried. 'The people you visit must have a precise value, the same as so many pounds of tea! You will be counting bones next, and if any one have the misfortune to lose a finger, you 'll say he mustn't associate with us, who have our normal ten!'

'Nonsense, Kitty, how wildly you talk,' said one of the Misses Follett; and the other didn't say much more; partly because there wasn't enough in them for much 'say;' and partly because no one—except Mrs Courtney—attempted anything against Miss Kitty. They would have come off badly in the venture if they had!

'Why, people with one arm—soldiers, injured men—mustn't sit at the same table with you,' was Kitty's next cry; 'and what of people who are minus two! Really, Jinny and Sophy, I hadn't thought you could be so mean!'

The three had got to the gate now, and the Follets took their rubbing laughingly, as it was intended, and then they went. Kitty stayed a minute at the gate to watch them to the bend of the road, and then, as she was enjoying the quiet and the sun, the thoughts that were nowhere if they were not with Abie Musgrave, were sent suddenly scattering by the sound of a horse's hoofs.

She turned hastily to go away. Stirred on a subject very dear to her, she was in no mood for the commonplace chat that must have come from her if the rider proved to be any one she knew; and she was just making her retreat behind a laurel hedge, when the horseman rode swiftly up to the gate, and she saw it was the very he of whom her thoughts were full! It was the man whose misfortunes were to be overlooked—it was Mr Musgrave!

She was back again to where she had started from directly, her face one bright open smile. A moment before, she had imagined words upon her lips, that had coloured her cheeks with blushes as she thought of them, and that she thought she *must* have uttered if Mr Musgrave could have come before her; but now, face to face in this way unexpectedly, usage—or, it may be, self-defence—gave her its involuntary armour, and she met him with only her ordinary pleasantry, and with a frank open hand.

He was better? she hoped. And he was enjoying a ride this nice summer day? He would move a little while she opened the gate, and let him in? He would stay, of course, now that he had come?

'No,' Mr Musgrave answered, thanking her with a face and hand as frank and friendly as her own. He would like, but as he couldn't, he must keep on saying no.

Then Kitty laughed, and said she saw through

Digitized by Google

it all. 'You saw the Folletts at the gate,' she cried, 'and you want to catch them up! I wish I had known, I would have kept them, just this one minute, back!'

'Well, they are not so far,' said Mr Musgrave—a tall, brown, bearded man, with eyes that looked down on Kitty very contented and bright. 'If I am so anxious, I could catch them up.'

'Don't let me keep you, then,' said Kitty, making a very elaborate mock-bow.—But she wanted him to stay with all her heart!

'Thank you,' laughed Abie, in her own vein. 'You are, as I have ever found you, *extremely* kind.'

'Good-bye, then,' went on Kitty. 'I won't detain you. Why don't you go?'

'It is such a pleasure to see you, Miss Kitty,' said Abie, imitating her lavish bow. 'The few moments I have to spare, I would rather spend where I am.'

If this had not been said so banteringly, it would have been exactly what Kitty would have liked to hear; but how could she tell whether, underneath Mr Musgrave's jesting, there was a meaning as warm as her own? She could only give her little laugh again, therefore, and she bent to stroke the horse on which Mr Musgrave sat.

'It is a pretty creature,' she said, toying with its mane. 'It must be a treat, now you are lame, to be able still to ride.'

'It is a treat that is only mine,' answered Abie Musgrave, 'through the kindness of Edward Sumner. I cannot afford to keep a horse now, Miss Kitty.'

Kitty spoke in a lowered tone. 'Not one, Mr Musgrave?' she asked—'not one?'

'No,' Abie quietly answered her—'not one. The Bracklington House stables are useless now; I might as well have them all pulled down.'

'You must miss *Old Sol*, then, sadly,' said Miss Courtney. 'I know you have ridden many a pleasant mile on him.'

'What colour was *Old Sol*, Miss Kitty?' asked Musgrave, smiling again, and making her look up with a smile too.

'Why,' said Kitty, recovering her usual way, 'he had a blue beard, of course, and a spotted tail; and his legs were yellow, and his back green; and his head and ears were the new *mauve!*'

'It was a clever thing, then,' laughed Musgrave, 'to sell him, and especially for a fair sum!'

'To be sure,' cried Kitty; 'just as clever as you should be; but no more. Any one could sell a gray horse or a brown!'

'Well, look at this I am on now,' said Musgrave. 'Does he look like my good *Old Sol?* How could you be deceived?'

'Poor old horse!' cried Kitty, seeing then it was really Musgrave's attached old friend. 'I am so glad you can have him still.'

'Yes, it was very kind of Sumner,' answered Abie. 'He bought him of me, and said, whenever I wanted him I only had to ask. But now, the thing is, that I cannot ask, Miss Kitty! I cannot afford a ride now in the middle of the day. I must mind my business. I was obliged to come out this morning to see the squire—he had written for me; but I have overstopped my time now, and I must go.'

He held his hand out to bid good-bye; but it did not seem as if he wanted to be away.

'It has made my ride the pleasanter,' he said again, 'having had this little chat with you; but I must not over-stay my time.'

How Kitty wished that words would come to her that would be right to say! How she wished the choking at her heart would go, and that she could speak to Musgrave as she would to any other man! 'When—when will you come to see mamma?' she hurried out, because she knew the time was vanishing in which she could say anything at all. She could not speak as calmly as she liked, but she must say something. 'You—you are such a stranger at the Combe!'

'I am a stranger everywhere now,' said Musgrave gravely. 'I must use myself to that.'

'Not here,' said Kitty, letting her eyes fall the moment she had ventured to lift them up—'not at the Combe!'

Could Abel Musgrave guess what her pretty trepidation meant? Did he know why her laugh was gone, and why her blushes rose so whilst he held her strangely trembling hand? Kitty could not tell. If the knowledge had been of all things the best life to her, it could not come to her, and she must stay unwise. She knew that Abie said he had spent *many* happy evenings at the Combe; she knew he said that he must come soon to thank Mrs Courtney for having been so kind to him when he was ill; for having thought of so many little dainties to do him good; and she knew he said again that he could not over-stay his time, with that strange lingering that had sounded in his voice before; but she knew no more. He had let go her hand at last, and he was gone.

CHAPTER II.

'How absurd I am!' Kitty Courtney said to herself the moment after. 'How very absurd I am! Here have I been talking to Abie Musgrave and never said a syllable to him about Ashbury Hall! And he looked so sad and overborne too! I might have thought of something that would have been a little pleasure. Bah! As though a *man* would care about a picnic! At anyrate, such a man as Abie—when, too, he has business matters troubling him, and has to fight only to keep his home! But I might have said something kind! No man is too manly to be moved when people are kind. Certainly, if he thinks I am a hard-hearted, unsympathetic person, I have only myself to blame. But why is he always so distant?—No, not distant; but just—just—just what I don't wish him to be, and that I never would be to him! I wish he knew that I had spoken up so much for him this morning, that I don't in the least care for money, and like him every bit as much now that he is poor!'

Miss Courtney sauntered on—down the laurel hedge, to where some tall trees sheltered her from the sun. The same song was sung by her thoughts still. The next time she saw Mr Musgrave, she *would* know from his manner whether he cared for her or not. It was only the certainty she wanted; it was only that she was longing to be sure! If he did *not* love her, why, then, so be it—amen. That would be the all. She supposed she could sustain a struggle as well as other men and women who had had to deliver up their best hope. She could chain *her* thoughts as others had had to chain theirs. She could stay *her* heart. It was to be done. But surely, surely, Abie *must* care! She could not have mistaken

Digitized by Google

all the signs that made up the tale that was such heaven! Surely he must—he must!

And Miss Courtney sauntered on still: past the verbena beds and hollyhocks—past the vinery on to the lawn; the scales adjusted in her mind still; the balance down on the side that was heavy with her heart's big wish. Then she told herself she was a little fool—which was pretty much what she had begun with—and she put an end to all her cogitations by a toss in the air of her pretty head, and a movement of her hands as if she would clear the mist from before her eyes.

Nevertheless, in spite of all renunciation, Kitty found that thoughts of Mr Musgrave would steal to her. An unexpected opportunity to meet him came. Those administrative girls, the Folletts, determined to have a little tea before the Ashbury Hall picnic, that arrangements might be talked over, and so be insured to run smooth; and to this Mr Musgrave and the Courtneys were invited. It made Kitty in a rapturous state of elevation. Her toilette for that happy evening became a matter of serious and blissful moment. Should she be dressed in white muslin, with rolls of blue velvet twisted in and out her hair? Or should she choose her pale-gray silk with poppy trimmings, and nothing in her hair at all? There were no eyes she thought of pleasing but Abel Musgrave's; and, of course, she knew his taste. And she made her choice for the neat gray; and, when the evening came, she put it on, and before the great cloak was wrapped round her that was to hide her all away during the half-hour's drive to town, she went down to her father, to give him her kiss and her good-bye.

A good 'auntie,' a small sister of the big Mrs Courtney, was with him (and able to stay with him all the evening, or Kitty would not have gone away), and the two looked up, brightened, when she opened the door and came in.

'Pap,' she said, with her hand upon his round bald head, 'it seems so unkind to be going out, and to leave you here.' She was so glad herself—she was warmed to such ecstasy—she felt more than ever how much her father was denied. 'Don't you think mamma and me very wicked things?'

'It 's no use going, Kitty,' said Mr Courtney simply; 'I can't walk, and I can't see.'

Kitty knew that, and that was why such love and pity came from her in a deep-pressed kiss. 'You dear old pap,' she said—'you good dear old pap!'

'And I went once, Kitty,' continued the old man. 'I was a spry young fellow in my day.'

Kitty knew that too; and she thought still more of the pleasure that was hers *now*, and that she trusted would soon be hers never to go away. 'You are a good pap,' she cried again—'you are a good, charming, dear old pap!'

'You won't be long, Kitty?' asked Mr Courtney. 'You will come back very soon?'

'Yes; very soon,' Kitty soothed him with—he never liked her or her mother to be away. And she thought of what the 'soon' would be to her, and of the happiness the next few hours would reveal.

She could not stay any more. Her mother sent to tell her the carriage was at the door, and she gave her aunt and father a parting kiss, and went down. Then, with a flush upon her cheek that made her look so much prettier than usual, that even Mrs Courtney noticed it, and gave a sharp glance at her as they passed through the hall, the drive to Aberminster and the Folletts' house began. There was much to listen to during its pleasant two miles. Mrs Courtney always had plenty to say on every subject in existence, and there was no reason why she should be less loquacious to-day than was her wont; so Kitty's dress—she cried—would certainly hang over the phaeton's side and get spoiled with mud—and her hair would get sadly roughened if she did not draw down her veil—and her own dress was so tight and uncomfortable across the chest, she was sorry now she had put it on. But Kitty was little the worse, or better, for the perpetual stream. She was going to see Abie Musgrave, and that was enough talk for her. When her mother told her of her dress, she quietly drew it in; when she spoke about her hair, she let her veil fall down; but *her* theme was Abie Musgrave, and all this rest was only foreign chords. She was going to Abie Musgrave, to talk to him, to sit by his side; perhaps, even she was going to sing to him—she had some of his favourite songs with her in the phaeton now; and she would just say to him gently, delicately, that she had other music that would please him when he had *inclination* enough to come; and she was sure his answer would be the very substance of her bright hope. It couldn't be in any other way!

She looked very pretty, stepping into the large cool room, by her tall and handsome mother's side. Her ample cloak was gone then, and the grace and heartiness of her manners had nothing to conceal them, as she gave and received a cordial greeting from everybody there.—Had Mr Musgrave come? was the sharp question of every pulse she had.—Yes! was the answer the same moment from her eyes. And she was led to him by Jinny Follett, and placed on a chair the very next to the one on which he sat.

Then, of course, her glad story ran? and she had warm answers exactly as she had hoped? No; not at all. Not one of the phrases she had rehearsed would come to her—not one could leave her tongue! Nothing was just as she had imagined it, so all her scheme was tangled, and no speech would fit! She had not expected to have found Mr Musgrave already arrived; she had thought to have been seated on the couch when he was helped in, and that this would have been the very couch on which naturally he would have been brought to sit. She had thought, then, that when those who knew him best had been up to make a little court to him, she would have been left alone to have made, just as naturally, the court that little much the more; but now she saw her mother and she must have left the Combe considerably too late, or else the Folletts were hurrying things on considerably too soon, for here was tea announced directly, and she had only asked Abie about his health, and other conventional little pros and cons, and she positively had not another opportunity for a word with him at all!

No, not all the evening long; actually, not all the evening long. She was not seated next to him at tea. Tea was a real meal at such times in Midlandshire, entailing placement at the table, and consequent shutting-off from chat with any folk but those at either hand. She could speak to him, of course, but it was only of such things as any Anne or Mary opposite to her could have talked about just as well, and as could have been

Digitized by Google

transmitted from one end of the table to the other openly, like the apricot jelly and rich almond-coated cake. She was not seated next to him at cards: these, and not music, were brought forward as the entertainment of the evening, and she and Abie both were marshalled off among the young and merry folk to the lively 'round game at cards;' but she might as well have been as far off him as the Combe, for she could only ask him from the distance, as she asked all the others, about a 'natural,' and whether he was 'content.' Then supper brought the same disappointment; he was four people from her, on the same side. She would not even have known that he was there, unless she had bent her head. *His*, therefore, were not the eyes that were attentive to her—*his* were not the hands that passed her anything she might desire. And, directly supper was over, Mrs Courtney rose to go away. She always did. She always would be the first, punctiliously, to rise from table—resisting every entreaty to remain for supplemental and freer gaiety after cold fowl and riddles had done their work. So there was Kitty up again in the bedroom, being helped on with her cloak, tucking her music-bundle behind her drapery, that it might not be seen that she had brought it, and feeling that she was no nearer the knowledge she had been longing for than if she had said no to the Folletts' invitation, and had staid at home!

Her attempt at concealment of her well-filled leathern music-roll was seen, and a sharp comment on it made.

'Why, we have never had a song!' the Folletts and a group of other girls cried. 'What a shame, Kitty, to bring your music, and then to leave it here!'

It is not pleasant, certainly, to take a music-budget anywhere, and then not to be asked to open it; but this was so small a matter to Kitty Courtney compared to that other budget she had had no chance to open, that she could afford it a very good-natured laugh. 'Oh!' she cried, pushing the obtruding portion of her roll tight in, 'it will do another time! It is not like the cream-cheese some of you have been declining to take to Ashbury—it will keep!'

And she laughed still more when she was in the quiet moonlight, in the phaeton, being driven home; and more still when the drive was over, and she was in the solitude of her own silent room. What—she asked herself—had her evening been? What had it all come to, now it was at an end? Its little events were all before her, spread out like one of her old school-sums, and what were they, now she could reckon them all up?—The lines were filled with ciphers, and there was no unit to make them anything more! She had been, and she had come away; but that was the Alpha and the Omega, and there was no midway on which she could lay her head and dream. She had been twisted in, and then she had been twisted out. She reviewed the little divisions of the evening: how she had been carried off after supper with the tide—past Mr Musgrave, past all chance of any word or look from him but the then said good-night—out from the room, out from the house, out from the very town in which he breathed, into the even, unflurried placidity of the Combe; and, obliged to be moved either by its cruelty or its absurdity, she vaulted from the former as too sober-serious, and turned her eyes only on the last.

Well, it was all over now; it was done; there was no more to be said or thought about it; and it was far better to let it go: she should be free now; indeed, she *was* free. Her heart was still, her pulses calm: she should never again deliver herself to such foolish hope and expectation; she would have fact for her subsistence from now; fact that she was sure that she could clutch when she wanted it, and that would not mock her by vanishing into air. She would sink back into the repose and serenity of the Combe; she would be her father's solace, her mother's listener, with only her music and her cheerfulness to be the gilding spread upon her way.

Two days after, she was ready for a walk to Aberminster. Ashbury Hall picnic was her errand, of course. In all history, the lives of men, being traced from outside points, approach the centre of some great event, and there become woven into one harmonious whole; and it was the same with Kitty and her friends. They were walking steadily towards their great pleasure-party; they carried each their thread to add it to the general woof; and though each was but an individual, a single purpose was actuating every one; and Kitty—any more than any other—could not wrestle against her fate. She was to go to the grocer's, and the chemist's, and the Cedars (the name of the Folletts' house), and if she did not execute her commissions properly, there would ensue a general woe.

'Pray, don't forget,' Mrs Courtney called after her, for the dozenth time: 'there is the essence of almonds, and the isinglass; the anchovy paste, and sardines; and then there is the message to the Folletts—altogether five things. Don't forget one; there 's a good girl.'

'To be sure, mamma,' Kitty cried. 'I will recollect that I have five fingers and five senses; and I will even go so far as to remember that there are five lancets in the church east windows, and that between our seat and the pulpit there are five pews; and then I shall be just as good as when I was a little girl home for the holidays at school! I will not forget!' Upon which she went a few steps out of her way to look in through the drawing-room window, and give an extra nod to her dear 'pap;' and then gathering a just-opened blush-rose, that was looking far too beautiful to be heedlessly passed by, she was really off Combe precincts, and set out upon her road.

If anybody else could have forgotten that Bracklington House—Abel Musgrave's—was next door to the Cedars, where she was going, Kitty Courtney didn't. Magnificently free as she was, superlatively superior to the fetters that might *once* have bound her, she was as conscious of the fact as if it had been a fierce Indian sun, and were pouring down vertically on her unprotected head. She knew the owner would not be there; she knew it was the time he would be absent at his factory; but she gave a long look at the well-known windows, and at the great hall-door that stood between them, nevertheless. Nearly all the shutters were closed; the flower-beds were unfilled; there was a thorough air of desertion and neglect everywhere about. And Kitty knew what this meant for Abel Musgrave. She knew it pointed at rigid self-denial—altered habits that must have seemed to him like migration to another land. But she walked on; made her call; walked by again; executed her little errands—with a salutation here and there as she passed any one she knew; and was down the hill again, leaving the narrow pavements of real

Digitized by Google

Aberminster town. Then she had to choose between one more street again or a pathway through the minster-yard; and having had enough of bustle and confusion, she decided to avoid the chance of any more, and she passed through the posts that formed the headway of the quiet path.

Dear, dear! There was Abel Musgrave!—What should she do?—He did not see her!—Should she turn back?—He was toiling, with two sticks to help him, to the seat in the south porch (quite close upon the path), and he need never know that she had been so near!—What should she do?

There was no choice now. Musgrave had accomplished his sharp difficulty of climbing into the porch, and had no sooner thrown himself heavily on to the seat than he had seen her, and was struggling to draw himself up once more, that he might do the meeting fitting honour. She could only run to him the same moment, hindering him, and laying a thoughtful hand upon his arm.

'You must not get up,' she cried, 'now I see you are so tired. I will sit by you rather than that; then I, too, shall get a rest.'

She did as she said, and the old south porch held them; and the sculptured angels were the only audience, with their folded hands and low-bent heads.

Abie thanked her warmly, so that the blushes flew into her cheeks. His resting-place would have an association now, he said. He always stopped there on his slow way from his home to his factory, and it would have a memory now it had always lacked before. She was *very* kind.

Kitty thought of the shrouded windows she had just passed by, and the flowerless garden-beds; and she could not reply with all of her usual cheeriness and laugh.

'It is no harm, Mr Musgrave,' she said, 'to have to do things to which we are not used. It is very good that there is a seat here exactly where you want it.'

'Yes, that is *very* good,' answered Musgrave, 'especially *now*'—and here Kitty was obliged to look up with a little smile and bow, because it was her nature, and she could not help it—'but the poverty that brings me here is no pastime! It requires a strong will to battle with that!'

Poor Kitty! This was just the time when she could have said: 'Poverty, Abie, is nothing! I am yours all the same!' or, rather, this was just the time when she could have sighed out that, if she had not been so magnificently free! so superlatively superior to love's every little chain!—but what could she do now? Nothing. Nothing but let her eyes again fall down; but trace round the dim carving of a grave-stone at her foot; but feel her heart was beating very hard.

'May I tell you,' asked Musgrave, 'what poverty brings to me?'

'Yes,' said Kitty, with her eyes quite down.

Then she heard Musgrave say that poverty meant, for him, the giving up of the one thing he wished for, the determination to do his all—to endure everything—till he could get back into his former position, and enjoy what he had enjoyed before. She heard him say that to do this, perhaps, he ought to have given up Bracklington House; but it was the mere shell of what it had been, he was living there with only one servant—all the furniture being gone—and he thought he might have been many months before he could have found any one to take it; and so, with that much of his former self, there he stayed. And then poverty, he said, made him work: it made him be his own overlooker, his own head-clerk; for he was resolved to pay off all his debts; he would recover his position no other way. But, he went on to tell, this was the mere sketch of poverty. The filling up came to a great deal more. Those were the few broad facts, which in themselves would be small and easy; but a hundred things that had become his nature had now to be checked a hundred times a day; and then there was the great wide fear, that when he had worked up to the prize he longed for, the prize might have been grasped by some other, and be gone away!

And there was nothing more. The old dim-carved grave-stone had other feet to tread it, the listening sculpture heard what other voices said. A group of visitors, led by the sexton, came up to enter that way into the church, and as they referred to Mr Musgrave for some matter of architectural history that was a point of dispute, Kitty said a little fluttering good-bye, and went her way. But she *thought* Abie pressed her hand; she *thought* his eyes had some special meaning in them as they rested on her face; and somehow she was not so confidently certain of her freedom when she got back to the Combe as she had been when she had started from it! And somehow she was not so confidently certain that it was so *very* happy to be free! It seemed to her—there was just a sweet savour coming—that there was something else that might possibly become a great deal more delicious still!

THE BASTILLE.

IN TWO CHAPTERS.—CHAPTER II.

THE details given in our former chapter will have afforded a clear idea of the organisation of the administration of the Bastille; we may now proceed to speak of some of the most striking facts mentioned in the archives of that institution, gathered from them by the laborious researches of M. Ravaisson, wherever those documents were to be found, which included the British Museum, those in the Dubrowski Collection at St Petersburg, the Arsenal and Imperial libraries at Paris, and other sources existing in that capital.

The case of the Count di Pagano, or Pagan, is one of the earliest of the sad histories recorded. What his offence was, beyond the accusation that he had been heard to say that he would kill the king by magical arts, is a mystery. The account that may be gathered from his letters, written in Italian, represents him as an old man seventy-eight years of age. He was imprisoned in 1652, and the letters he addressed to the minister Colbert date from 1661 to 1665; it cannot, therefore, be said that he was impatient in beginning the long course of supplications he continued until the day of his death, as is supposed. The tale of his sufferings is more pitiful than many a narrative of a like kind that has made a noise in the world. Their severity may be inferred from the statement, that from want of means to buy candles, he was obliged to pass the greater part of his time in darkness;

Digitized by Google

that he had been compelled to wear the same and only shirt he possessed seven months. He begged the minister to make the sole gift he had bestowed on him, four hundred francs, an annuity, in order that he might not be compelled to lie naked on the bare ground; the man of whom he hired the few articles he had previously had the use of, having refused to allow him to retain them any longer, because he had not been paid for upwards of a year. The sole answer of Colbert to his heart-rending supplications that can be found is the laconic one, 'Let him be clothed.' What ultimately became of him is not known; the date of his last letter is the 28th November 1665, and it is a remarkable coincidence that the celebrated engineer, Blaise Pagan, is recorded to have died at Paris on that very day; the question is, whether this may not be the same man who had endured this terrible imprisonment through thirteen weary years, without having been brought to trial, and simply because of the accusation that he had boasted that he would cause the king's death by his magical arts.

The hatred Mazarin bore to the Cardinal de Retz extended to his servants and all connected with him. Either the minister must have been very severe on the score of morals, or he was hard driven to find a reason for committing the Abbé Dorat, a friend of the cardinal's, to the Bastille, the charge against him being merely, that when he lost money at card-playing, he cursed and swore out of all measure. That he was not likely to improve in this respect while in prison, is certain, supposing the statement of an official is true, that the greater part of the prisoners lived without religion, amidst curses and blasphemy; that the Bastille was, in fact, a kind of hell upon earth, in which the strong-minded, strong-armed spinster, who bore the name of De Vezilly, and whose appearance as a litigant was familiar to all who attended the law-courts, was greatly out of place. She was confined sixteen months in the prison, for having abused, boxed the ears, and attempted to strangle the president of one of the law-courts, because, as she alleged, he had favoured the cause of her brothers, in opposition to her own.

Another case shews to what extent crimes might be committed with impunity by men possessing influence even so late as the time of Colbert. The criminal was a certain Marquis de l'Hôpital, cousin of the marshal of that name, who was noted in the locality where he lived for his dissolute conduct. The parish priest, who did not see in his high rank any reason for sparing him, publicly rebuked him. To revenge this well-deserved censure, he waylaid the priest, and with the aid of two pages he had taken with him, he killed a peasant who accompanied the censor of his acts, and left the latter lying on the ground, with, as was stated in the account drawn up for official purposes, no less than one hundred and twenty wounds, notwithstanding which he was picked up alive. The offence for which he underwent this cruel treatment was so creditable to him, that the whole body of the clergy took up his cause. The marquis was summoned to answer for his crime before the parliament, but he managed to elude the condemnation hanging over his head by availing himself of all the expedients at the command of the wealthy and influential in those days to put off any judgment of his case. Meanwhile the affair had assumed the form of a struggle between the nobility and clergy, the latter endeavouring to rouse the king into doing justice, by recalling to his memory that he had solemnly sworn on the day of his consecration to renounce the right of pardon in the case of assaults on ecclesiastics. The nobility, on the other hand, saw, or pretended to see, in this attempt to bring one of their order to justice, an attack on their privileges, which they represented as involving an attack on those of royalty. By the exercise of his influence, and the claims he had on the regency, the chief of which is said to have been the murder of the Marshal d'Ancre, Marshal de l'Hôpital procured the grant of what were termed 'letters of abolition,' which seems to mean a quashing of the entire case. The scandal, however, was of too crying a nature to admit of such a termination of the affair, and the parliament refusing to let the matter drop, the only way in which a victory could be obtained over it was the manœuvre of making the criminal surrender himself as a prisoner, and then conniving at his escape.

It was about the same time that the first pamphleteer was arrested on account of circulating what in France were termed *gazettes à la main*, or, as similar publications were called in England, 'flying sheets,' which in France, and probably in this country also, would have been often better denominated by the omission of the letter *f*. He did not suffer long for his novel offence; his plea, that what he had done was for the purpose of earning his daily bread—a plea that seems to have been equivalent to absence of malicious motives—was deemed a sufficient excuse, and he was set at liberty.

Wicquefort—the author of a work bearing the title, *The Ambassador and his Functions*, which, by the way, was written while he lay in prison under sentence of imprisonment for life for having sold, in 1675, to the English ambassador the originals of the secret advices given by Lord Haward to the Dutch government—tasted imprisonment in the Bastille, but was liberated after a few days, though only to be conducted, very much like a common felon, by an agent of police, to Calais, and there put on board a vessel, by which he was conveyed to his country, and surrendered into the hands of his government. The documents dug up concerning him by M. Ravaisson would induce any jury to pronounce that he richly deserved the treatment he received.

Mistakes were sometimes made in the arrest of individuals; one of these occurred in the case of the king's biographer, a man named Magnon, who acted with Molière, and who was himself the author of some very indifferent plays. The mistake was made clear, and he was liberated after a short imprisonment, though, if he could have foreseen that he would be murdered soon afterwards, he would probably have preferred enduring the ills he had, to exposing himself to so tragical an end.

From the description given of the building and

the manner in which it was guarded, the reader will have no difficulty in believing that escape from the Bastille—unless connived at by the authorities—would be impossible. Nevertheless, an escape from it was once made, and the narrative is one of the most marvellous on record. The name of the prisoner who had the courage to attempt it was Latude. The offence for which he was imprisoned was having attempted to obtain an appointment by representing to Madame Pompadour that a plot existed for taking her life; rather an odd way of effecting his wishes, but his calculation was, that by awakening her gratitude, he might succeed. His scheme was seen through; and to punish him, he was sent first to the prison at Vincennes, from which place he made his escape, and then to the Bastille. By observation, and by counting the number of steps that led from his chamber to the chapel, he satisfied himself that there must be a double floor. By means of two iron legs drawn from his table, and worked on the tiled floor until they had a flat edge resembling a chisel, he and a fellow-prisoner got up the tiles, and found that not only was there a double floor, but that the space was left empty. The next thing to be done was to make a cord, and to do this he was abundantly supplied with material; having at his disposal a good stock of linen, which he had been allowed to retain as not being contrary to the regulations of the prison. They began by drawing out the threads one by one, until they had sufficient to make a kind of ladder between fifty and sixty feet in length. By means of this ladder, they sustained themselves in the chimney, while they worked with the legs of the table at the iron bars which defended the exit of prisoners in that direction. This labour was frightful. The mortar had become so hard by time, that if they managed to clear it away to the depth of the eighth of an inch round one bar in the course of a night, they considered it a good night's work. To soften the mortar, they used to ascend with their mouths full of water, and spurt it into the hole, little by little, as they got on with their work. Had they been able to work freely, this would have been excessively toilsome: as it was, they had to work in such painful positions, that one hour at a time was the most they could endure, and their hands were so cut and bruised that they never descended from their labour without finding them covered with blood. Notwithstanding the torture it caused—of which Latude could never speak in after-years without a shudder—they persevered in their labour; and at the end of six months, during which they had steadily prosecuted it, they had succeeded in loosening the whole of the bars, and were at liberty to continue the manufacture of the rest of the articles they required.

First of these was the wooden ladder, to enable them to ascend from the moat to the parapet, and from thence to the governor's garden. As the prisoners had to supply themselves with fuel at their own expense, they had a stock of wood in their cell, which was sawed up in logs of about twenty inches in length. To cut these logs to suit their purpose, a saw was necessary; this he made out of an iron candlestick, by means of half of the steel belonging to the tinder-box, from which he had previously manufactured a knife. By the use of these tools, they worked their logs into a ladder, every part of which was marked in such a way that they could put it together in the dark. All these things were stowed away beneath the floor as they were completed, to await the night when the attempt at escape was to be made. But in addition to the wooden ladder, another had to be made of not less than eighty feet in length. The linen and silk articles were again resorted to, and the process of unravelling continued until, in course of time, they had worked the threads into rope capable of bearing the weight of a man. This was intended to effect the descent from the top of the Bastille; but this was not enough. Knowing that this top projected over the wall too far to allow a man to steady himself in his descent by its means, and not knowing how long circumstances might require them to remain on the ladder, during which they would be swinging backward and forward, and spinning round like a joint of meat before a fire, they made another rope one hundred and sixty feet long, which they passed through two holes drilled through the ends of one of their logs. This rope would of course hang double, and by holding one in the right hand, and the other in the left, they were able to steady themselves in their descent. Other ropes were made for sundry purposes, the total length made by them being about four hundred and seventy yards in length. So much for the preparations, which were only a part of those required before the attempt to escape could be made.

Having fixed on a night to make the attempt to escape, Latude climbed the chimney, in doing which he underwent great pain from the grating off of the skin from his elbows and knees. He had carried up a cord with him, and by its means he drew up the different things they required to aid their escape, which were followed by his companion. Having reached the platform, they fastened the ladder to one of the guns, and Latude descended successfully, but with immense pain and difficulty. His companion then drew up the loose rope, and lowered their tools, after which he came down himself, Latude holding the bottom of the ladder, which made it comparatively easy. All this was done within hearing of the sound of the sentinel's footsteps as he marched to and fro. The moat they had descended into was filled with water to the height of their armpits, and had pieces of ice floating in it. As they had been obliged to give up the mode of escape they had planned in the first instance, the only other way was to wade through this water to the opposite side, and by means of their bars to make a hole through the wall. This wall was nearly five feet thick, and it took nine hours to make a hole large enough to squeeze through. Besides the labour this involved, every half hour they were obliged to dip their heads under water, to avoid the risk of being seen by the guard, the light of whose lantern fell upon the spot where they were at work every time the rounds were made. At length, after incredible exertions, they found themselves outside the wall and at liberty; but they had not gone far before they fell into an aqueduct, the water in which was about ten feet deep, and there was a great thickness of mud at the sides. With great difficulty they scrambled out, ran some distance, and then fell on their knees to offer up a thanksgiving for their escape.

It is a remarkable circumstance in the history of the Bastille that the builder of the two towers of which it was originally composed ended his days as a prisoner in one of them; the last

Digitized by Google

governor, the unfortunate Launay, was murdered, as everybody knows, when the Bastille was taken by the populace in 1789.

FAR EAST.

The great and increasing prosperity of the Dutch colonies has attracted much attention to them of late, leading to their being discussed in books and pamphlets from the commercial, social, and political points of view. An American traveller and naturalist of eminence, Mr Albert S. Bickmore,* has lately visited the beautiful and romantic Eastern Archipelago, in the interests of natural history and science; and, while contributing to our knowledge in the above-mentioned branches, furnishes an extraordinary and brilliantly picturesque account of the fantastic group, in the midst of whose serpentine forms the vast island of Borneo lies like a huge slumbering turtle. Bound to

> The glad islands of glittering seas,
> Where scented forests perfume the breeze—

to the coasts guarded by the fabled harpy, terror of the old Dutch sailors, the traveller began to perceive indications of the tropical features while yet far off. Snakes swam, and fragments of rock, and sea-washed palms drifted over the sea; and, like Columbus, he first saw the cocoa-nut, idly tossed by the waters—that strange fruit, for one specimen of which a prince of Ceylon is said to have given a whole shipload of spices, unconscious that it grew in profusion on the Seychelles. While the shore was yet thirty-five miles distant, the air was fragrant with the odours of the isles; and as they sailed up the Java sea, the irregular contour of the coast formed scenes of endless beauty and variety, with its dense and varied vegetation, its groups of tall palms and mangroves (the latter even below high-water mark), divided from the ocean only by a strip of ivory-white coral sand, shining with wonderful brightness in the sun.

Batavia is not a bad place to linger at a while, even though one wants to get on to the tropical savage life, which influences it not at all, and yet is so near it; and a quite delightful place for the student of science, as it boasts a number of valuable 'collections,' and two 'Societies,' whose proceedings are of the most energetic kind, and whose publications are of great scientific importance. It must have a strange effect to watch things of this kind going on in a place where the population is so mixed, where the Europeans number only 5576; and the other thousands who make up the half million inhabitants of the residency of Batavia are Malays, Chinese, Arabs, and 'all other eastern nations,' to whom the intellectual activity of the Europeans is of course unintelligible.

The natives (Malays) are remarkably short of stature, the male sex not averaging more than five feet three inches in height. Their faces are lozenge-shaped, the cheek-bones high and prominent, the mouth wide, and the nose short but not flat. Mr Bickmore gives the coast-people a good character for mildness, trustworthiness, and hospitality. They are also very quiet and indolent; are nominally Mohammedan in religion, but not in the least fanatical; retain many of their Hindu notions, and are passionately addicted to gambling. They are very cleanly, and bathe constantly, in large and sociable parties, on which occasion the utmost decency and good manners are observed. Beards are represented among them by a few straggling hairs, which they pull out; and the lank coarse hair is worn long by both sexes, so that it is not easy for a stranger to know whether he is looking at a man or a woman. There is nothing exciting about these harmless people; but the wild tribes of Sumatra, the Celebes and Ceram, supply plenty of the strange and terrible. The buffalo abounds in all the large islands of the Archipelago, as in Ceylon and India. In Java, it is very ugly and very useful. It must be startling to a stranger to come upon pools of water whence protrude the noses and eyes of these slow creatures, called there the water-ox. The natives make artificial ponds in the highlands of the country, that the buffaloes may rest, after their favourite fashion, on their journeys. They are docile creatures generally, but have an extraordinary dislike to the sight of Europeans, which they exhibit by breathing heavily through the nose. 'At such times,' says Mr Bickmore, 'they become restive and unmanageable, and their owners have frequently requested me to walk away, lest I should be attacked.'

The natives are not deficient in appreciation of the beauties of nature. Among the lofty dark-blue mountains to the south, a native prince, named Rahden Saleh, possesses a magnificent estate, and a palace like that of the fairy Pari Banou; it is the richest native residence in the Eastern Archipelago. Rahden Saleh is an extraordinary person, and when Mr Bickmore visited him, he found him engaged in forming a portion of his grounds into a superb zoological garden for the government at Batavia. He is a fine landscape-painter, an accomplished linguist, and the original of the Eastern Prince of Eugène Sue's romance, *The Wandering Jew*.

The determination of the Dutch government to make their settlement as much as possible self-supporting, has developed a number of mechanical industries among the natives, who appear to be a happy people, dividing their time between moderate labour and immoderate gambling. The Dutch government prohibits cock-fighting, but the Spaniards only tax the vice, so that in the Philippines it is indulged in to an extent which brings in a yearly revenue of forty thousand dollars. The Malay language bears testimony to the prevalence of this infamous amusement; it has one specific name for cock-fighting, one for the natural, and one for the artificial spur of the cock, two names for the comb, three for crowing, two for a cockpit, and one for a professional cock-fighter. In a public garden at Surabaya are some images, of immemorial antiquity, of the gods of the ancient Javanese worship. The favourite, judging by its frequency, is a man with the head of an elephant, seated on a throne resting on a row of human skulls. The elephant, abundant in the peninsula, Borneo, and Sumatra, does not exist in Java, nor does the beautiful wild horse of Sumatra and the Celebes. Six species of deer are found, among them the lovely animal almost legendary in Europe, the pure white deer.

Birds are numerous and gorgeously beautiful, and the wonders and delights of the forests what tongue can tell? To every insufficient picture of them the mind reverts with ever fresh pleasure,

* *Travels in the East Indian Archipelago.* By Albert S. Bickmore, M.A., F.R.G.S. of London, &c. London: John Murray.

Digitized by Google

untired by a certain sameness, feeling its charm ever new. Miles and miles of magnificent forest cover the hillsides and crown their heights, with masses of the palm, the cocoa-nut, the banana, the zambutan, the mango, the bamboo, the giant fig-tree tall as the palm, great oaks and shining laurels, luxuriant graceful ferns, and the beautiful cotton-wood tree. Far above the tropical forest, the tops of the barren volcanic mountains spread their grim irregular range, in the temperate region. It would be difficult to imagine more enjoyable travel than a coasting-voyage in the seas which surround these wonderful islands of the far East; a voyage which is but a succession of beautiful views, and of opportunities for the observation of the grandest atmospheric and other phenomena. The awful 'burning mountains' lend terrific grandeur to the scene; while the story of the sudden overwhelming ruin which they wrought is not to be forgotten for all the beauty and the life around.

It was midsummer when Mr Bickmore reached Amboina, the goal of his long journey, and the most important of the Spice Islands. Here, one hundred and fifty years ago, Rumphius made his great collection of Eastern shells, described, in 1705, in his *Rariteit Kamer*, which was lodged at Leyden, and destroyed in that period so fraught with disaster to the arts and sciences, the first French Empire. Mr Bickmore journeyed to the far East to make a similar collection for the benefit of his own country. He had to encounter much difficulty and not a little danger, including a horrible ascent of a volcanic mountain, which one shudders to read, and an encounter with a huge python, which is a tale, for all the quiet tone in which it is told, worthy of the most thrilling style of boy literature. The shells are his chief objects, but he will not find many readers to agree with him; they will linger over the extraordinary details which he gives of the customs of the savage tribes of the interior, concerning whom he confirms many of the horrid stories which have hitherto been supposed to be either quite mythical or highly exaggerated—and the wonderful productions of nature, which he describes with a true naturalist's love.

Early in his stay at Amboina, Mr Bickmore saw two fine specimens of the *Birgos latro*, an enormous hermit crab, whose habits are most remarkable. The creature feeds on the universally beneficent cocoa-nut. As the ripe nut falls from the tree, it tears off the dry husk with its powerful claws until the end of the shell, where the three black scars are found, is laid bare. It then breaks the shell by hammering with its heavy claws; and the oily fattening food within is obtained by means of the pincer-like claws attached to its hinder joints—so perfectly is this animal adapted to its peculiar mode of life. The huge hermit is regarded as a great delicacy for the table, and is carefully fed for that purpose. When the traveller, having done a brisk trade in shells, departed for the next village on the coast, he asked the rajah if he could give him a bottle in which to carry water in his canoe. 'The rajah,' he says, 'smiled to think I could be so unaccustomed to tropical life, and ordered a servant to climb one of the cocoa-nut palms above us, and cut off some of its clusters of large green fruit. These we could carry anywhere, and open when we pleased; and a few strokes with a heavy cleaver at once furnished us with a sparkling fountain.'

This same rajah gravely displayed to the traveller, as priceless treasures, a few glass rings, which he averred were not the work of man's hands, but had been taken out of the heads of snakes and wild boars! All attempts to explain their real nature and origin were vain, and ill received. The possession of the magic treasures enhanced the rajah's importance, the explanation would have endangered it.

The clove harvest is an interesting period and object. It occurs twice a year, in June and in December. The natives of the islands where they grow never eat cloves in any form, and there is no reason to suppose they ever did. 'The clove,' says Mr Bickmore, 'probably came into use originally by accident, and I believe the first people who fancied its rich aroma and warm pungent taste were the Chinese. The similarity of the native name to that of the Chinese, and its marked difference from that of the Brahmans, or Hindus, lend probability to this view.' When the Portuguese first came to these islands, the Chinese, Arabs, Malays, Javanese, and Macassars were all found here trading in this article. The first notice of cloves in Europe occurs in a law passed during the reign of Aurelian I., between 175 and 180 A.D., where they are mentioned as forming an article of commerce from India to Alexandria. The round-about mode of travel, and frequent transfers, so increased the original price, that in England, before the discovery of the Cape of Good Hope, thirty shillings per pound were paid for them, or L.168 sterling per hundredweight, which was 365 times their original price. It was to make this immense profit that the Portuguese, the Spaniards, the Dutch, and the English were all so anxious to find a passage to the East by sea, and why, when those islands had been discovered, each strove to monopolise the trade itself, and all carried on such a persistent and piratical warfare for years. In the traveller's account of the earthquakes in the islands—one a year is the minimum at Amboina—there is a close resemblance to that given of the eruptions in Iceland by the Swedish professor Pjakjull with respect to the diseases caused by volcanic action. In 1699, when a succession of earthquakes occurred all over the Archipelago, frightful epidemic fever prevailed, and the theory now advanced is, that quantities of poisonous gases arose out of the earth during the violent shocks.

On the whole, the life of the natives of these beautiful islands is a happy and enviable one. They never know any physical want, and they are apparently incapable of mental anxiety, the desire to have something reserved for sickness or old age is not known to them, and they have no conception of the meaning of a famine, and no word in their language to express it; nature having supplied their wants with an unsparing and unfailing hand.

The prevailing elements of the picture are beauty and peace, until Ceram, the largest island in the Moluccas, is reached. It is really one great mountain-chain, which sends off many transverse ranges and spurs, the only lowlands being east of the Bay of Amahai, and forming its southern shore. Some of these mountains are of magnificent height, and the entire range is covered with continuous and unbroken forest. Many portions of the island are entirely unknown, and the estimate of its population is almost guess-work. Judging of the natives by Mr Bickmore's description, the fewer there are of them the better. The Resident at

Digitized by Google

Amahai sent some of the coast-people to invite the *Alfura* or savage mountain-people to come down and perform their war-dance. A party of twenty accepted the invitation. They resembled the Malays, but were darker, and had crisp though not woolly hair. Their clothing was not abundant, and being made of bark, resembled a strip of coarse brown paper, four inches wide and three feet long. The following brief description has something about it peculiarly dreadful, though we are tolerably well accustomed to savages. 'Each of the warriors was armed with a *parang*, or cleaver, which he raised high in the right hand; while on his left arm was a shield three or four feet long, but only a few inches wide, which he held before him, as if to ward off an imaginary blow. Their dance was merely a series of short leaps forward and backward, and occasionally whirling quickly round, as if to defend themselves from a sudden attack in the rear. Their only musical instrument was a rude tifa, which was accompanied by a monotonous song from the women, children, and old men. At first, the time of the music was slow, but by degrees it grew quicker and louder, until all sang as fast and as loud as they could. The dancing warriors became more excited, and flourished their cleavers, and leaped to and fro with all their might, until, as one of our company remarked, their eyes were like fire. It was easy to understand that in such a state of temporary madness they would no more hesitate to cleave off a head than to cut down a bamboo.' Nor do they hesitate, for they are far-famed head-hunters, and are even greater proficients in the art, and more devoted to its exercise, than the Dyaks of Borneo, for it has passed into a law of the tribe that no young man can marry until he has cut off at least one human head. This systematic enactment reduces the Bornean savages to the rank of mere amateurs in comparison. With what horror the American traveller, fully realising this horrible fact, must have regarded these frenzied wretches, more loathsome than any brutes! The head of a child will suffice for the bare, scanty, formal fulfilment of the law, though it is regarded as a mean offering—the head of a woman, because she can possibly escape, or shew some kind of fight, is somewhat more glory; the head of a man is held, of course, in higher estimation; and the head of a white man is a proof of the greatest bravery, and is therefore the most glorious trophy. A few years ago, the Dutch on the north coast had a war with these natives; and when they had driven them to the mountains, they found in their huts between two and three times as many human skulls as it is probable there were people in the whole village, men, women, and children taken together. When a man is afraid to go out on such a hunt alone, he invites or hires two or three others to assist him, and all lie in wait near a neighbouring village, until some one chances to pass by, when they spring out, despatch their victim, and escape. This, of course, creates deadly enmity between each tribe, and every other near it; and the whole interior of the eastern half of the island, where head-hunting prevails, is one unchanging scene of endless bloody strife. When a head is secured, the brains are taken out, and it is placed over a fire to be smoked and dried. During this process, the muscles of the face contract and change the features until they assume a most ghastly grimace. When a warrior has cut off a head, he draws a circle on the paper-like bark of his only garment. One of the pleasant persons who danced for the delight of Mr Bickmore, had four such circles; and the traveller gave him to understand that he knew their meaning, by drawing one hand four times across his throat, and then holding up four fingers; 'whereon,' he adds, 'the savage hopped about as delighted as a child, thinking that of course I was regarding him as the bravest of the brave, while I looked at him in mute astonishment, and tried to realise what a hardened villain he was.' One heartily sympathises with the comic little touch of complacency in the next sentence: 'Our North American savages are civilised men compared to these fiends in human form.' He saw more of the Alfura a little later, when he went into the mountains with a band of soldiers hunting for rebels, and arrived on the scene of one of their drunken revels, in which each man drinks as much of an intoxicating liquor, made from palm-juice, as he possibly can, and then all join in a dance, and kick about a human head, obtained for the special occasion, and tossed, all bleeding, into the centre of the convivial circle.

The most sentimental philanthropist would surely acknowledge that the Alfura want a good deal of extermination. Mr Bickmore's sensations are quite intelligible. 'The natives,' he says, 'whom our soldiers had seized were present, and took part, as they confessed, in these bloody carousals. A sickening fear crept over me before I fell asleep, as I realised the probability, that were it not for our guard, instead of our taking away these culprits to be punished, they would sever every one of our heads, and have another diabolical revel.' The surprising fact is that, under the circumstances, Mr Bickmore managed to go to sleep at all. It was a delightful change from these fiend-haunted forests to the beautiful nutmeg groves of Neira, and the splendid coral reefs of Lontar; the ascent, which, however, was frightfully perilous, of the terrible Gunong Api volcano, and the seclusion, for exploring purposes, in a forsaken hut in the recesses of the forest, with the strange bright birds for companions, and the wonderful trees and flowers for the traveller's ceaseless, ever-new delight. In the northern peninsula of Celebes, amid much that is beautiful and attractive, Mr Bickmore especially noticed one dreadful sight, a leper village, containing nineteen inhabitants, whose sufferings he describes, after a solemn and startling fashion, adding: 'No one who has not seen such lepers as these can have any idea of what forms human flesh can assume, and life yet remain in the body.' It is consolatory to read his testimony to the humanity with which they are treated by the Dutch government.

The Padang Plateau abounds in interest. Every production of nature is there beautiful, lavish, delicious to every sense; the sublime, the graceful, the luxuriant, and the romantic are wonderfully mingled, noble and majestic animal life abounds. Only the human race is detestable and terrible; Mr Bickmore's account of the cannibal Batta tribes is among the most frightful records of savagery yet added to the annals of humanity. They are habitual, and, so to speak, *dilettante* cannibals, cooking the human carcass in different ways, and seasoning it with various condiments. They do not eat only their war-prisoners, or enemies; cannibalism is the ordinary gratification of their appetites, and their cruelty is so infernal that

Digitized by Google

Dante himself could not have evolved it out of his imagination. The natives of the Pagi Islands are dreadfully savage and degraded, but they are not cannibals. One turns with delight from these miserable beings, to the noble beasts, the gorgeous birds, the curious insect tribes, and the redoubtable serpents, which in their far superior fashion people the far East.

STRINGING THE NERVES.

When you Englishers hear an American tell a story, you generally Ho, ha! or Ha, ha! or wink at one another, just as if it was down impossible for what you call a Yankee to speak truth. And I must say that we do sometimes indulge in a bit of tall talk. But I'm going in now for a bit of the real grit—something that happened down our way, and not something that I was told, but saw with my own eyes, acted in, and was mixed up with; and I want you to be on good terms with me, and for once, in a way, just to take for granted that what I tell you is quite true.

You see, I'm an engine-driver on the Great West-by-north Railway. We don't chase lightning over the prairies on our line, for we're slow and pretty sure. I've been half as fast again on your London and Birmingham and Great Western—faster than I liked too, though it was my trade, so you see I don't mean to raise your hair that way.

Ours is a new line—a very new one—running through miles of unsettled country, where it's no wonderful thing to make out in the far distance half-a-dozen Inguns galloping along with their hair and blanket streaming out behind; and more than once I've wondered how it would be if one of those painted beauties was to collect his friends, and pull up the line. 'Pon my word, it's about as sensational a feeling as can come over you. Talk about your hair standing on end, why, there's a perceptible creeping, for all the world as if some one was pouring canary-seed through the roots. And, mind you, tomahawk and scalping-knife are not things only to be heard of in Cooper's novels, for they are in use to this very day, so that more than one Sioux or Pawnee warrior can display his green and bloody scalps torn from the heads of the hated whites by his treacherous hand. Seems very horrible, no doubt, and to belong to the past; but for all that, such things are taking place every day in the Far West.

Now, it's through this part of the country that our line runs, and for years past I've drove on that line. I drove there when it only ran twenty miles; and I saw and ran along that line as it stretched out farther and farther into the great region westward, till it went its hundreds.

We've cow-catchers on our engines, and nothing to laugh at neither. On your few mile-long lines, you can fence; but when your line happens to get over a thousand miles, fencing comes expensive, and would make a hole in the profits; so that it was soon found necessary to have something in front that would throw off a cow or a bullock if it had strayed on to the line; or else, being an obstinate sort of beast, it might throw off the train. For they will stray, and there's no mistake about them, and when you see them there, and sound the horn—for we use that as well as a whistle—instead of the stupid things getting off and into safety, they'll go galloping on in their clumsy cock-tail one-two-three amble, till we catch up to them, and then—well, I should say that in my time I've made beef of a score of cows, though I never made an end of a fellow-creature yet. I was very near it, though, once.

You've laughed about the stokers going out in front on to the cow-catcher, to heave billets of wood at the brutes; but it's a fact, and I've done it before now; and a good crack from a cornerish piece of wood has saved 'em, making them give a kick and a plunge off the single line, and giving us room to go by.

But there are things that will not get out of the way, do what you will; I believe you might sound the horn or whistle, or whatever you'd got, at any old woman who was crossing the line, and she'd only stand still and stare; while, if you had a billet of wood, she'd only shake her umbrella at you, and call you a villain. They're dreadful creatures are old women, and if it warn't for the thought that they were once young, I don't know how we should bear them. They don't seem to understand railways at all; they never have their tickets ready; they're always either too soon or too late; and when once they are in the car, they bother every one to death, and drive the guard mad by expecting that folks have entered into a conspiracy to carry them right past their destination. Why, a friend of mine, a guard on the line between New York and Chicago, once told me of an old lady going to the last place and wanting to get out at the first station.

Well, putting cows first, and old women second, the next on the list, to my way of thinking, stand children, bless 'em! I love children, got half a score of them myself, but they always give me the cold shivers when I see them near a railway. For you see, I suppose, for company's sake, being an out-of-the-way lonely spot, there was a chap built himself a log-shanty close to the line, where he had made a bit of a clearing, and perhaps he thought it would be a bit of company for his wife and little ones to see the trains go by with people in, besides being a bit of protection from the wandering tribes about; for you see where a man sets up his tent, as you may say, out in the wilderness, he's obliged to run risks; so any chance, however small, of making it less risky is snatched at.

I got quite to know those people, and nice, hard-working folks they were. Why, before they had been there six months, that bit of wilderness began to look like a little garden of Eden; and two more people came and pitched in the next bits. I quite knew those first folks, though we never spoke; for I always went by them at twelve miles an hour; but the little ones used to stand at the shanty-door and cheer, and as time went on, I'd wave my hat to the wife and the husband too, so that they generally used to come out, when they heard me coming up or down; and more than once mine has been an anxious journey when I've passed there, and all has been quiet, for I've thought that perhaps the Inguns had been down, which would have meant murder and fire; but somehow I never had that to trouble me, for the next time I'd pass there would be some one at the door or in the strawberry patch in front.

We got to be such friends at last, that I used to buy candy and dough-nuts, and heave 'em into the garden as I went by, for the children to scramble after, and that's what it was that did it, and this is how it was.

We were going comfortably along one afternoon,

Digitized by Google

till, as we got near the clearing where my friends, as I called them, were located, I began to furridge about in my pockets for a couple of papers of something that I'd got, when my stoker says: 'Hollo! what's that on the line?'

'Cow?' says I.

'Cow; no,' he says: 'why—why—it's three children!'

'Sound the'—— I did not stop to finish, but opened the little valve myself, making the still afternoon air quiver with the hollow booming roar it sent far and wide.

'That's moved 'em!' says my stoker, laughing to see the little distant figures scamper away.

'I thought it would,' I says; and then with my hand on the valve, I made the thing scream and roar again, for there was one of the little ones still right in the middle of the track.

In a moment I'd forgotten all about the stuff in the papers, for a curious sort of feeling came over me, one that for a few moments took all the nerve from my limbs, so that I could not move; and then, instead of reversing the engine, I began to creep forward; while, as if from the same feeling, my stoker stood staring with all his might right at the poor little child.

We were too near for it to have done any good, even if we had both done our parts, and it was with a groan seeming to force itself out of my breast, that I told myself it was through my encouraging the poor children with presents that this was going to happen, for there, seeing no danger, was a little bright-eyed, long-haired thing dancing about and waving its hands as we came swiftly on.

It takes me some time to tell it, but it only took a few moments; and there it all is now like a picture that having once seen I can never forget. It was a glorious, golden, sunshiny afternoon, with all looking bright and mellow: the hut, with its patch of flowers; the children by the side of the line, and their mother running out wild and frantic-like, but only to drop down in the track, half-way between the door and where her little one was dancing and waving its little hands as we glided on.

I felt like a man does in one of those nightmare dreams, when the will is there to do something, only a dreadful kind of face holds you back, and you can see danger coming nearer and nearer, and yet not avoid it. We neither of us spoke, but stood there, one on each side, leaning forward as helpless as the poor little child in front, till, with almost a yell, I fought clear of the power that seemed to hold me, and with the feeling on me that I was too late, crept along the side of the engine, and lay down with arms extended in front of the cow-catcher.

Only moments, but moments that seemed like hours, as with its strange, hurrying, jumping motion, the engine dashed down, as I told myself, to crush out the life of that poor little innocent. I wanted to shut my eyes to keep out the horrible sight, but I dared not; and though now I seemed to be doing what might save the child's life, I could not think it possible. There it was, just in front, and yet we appeared to come no nearer. In an ordinary way, we should have passed the shanty a score of times; but now the horror of those moments acted so upon my imagination that we seemed to crawl slowly but surely, like the motion of some vast machine that hardly seems to move, and yet forces its way on with a power that there is no stopping.

Twenty yards—ten yards—were we never going to pass over the spot? or would some miraculous power stop the engine? I tried to shout, but only a curious hoarse noise came from my throat; I wanted to wave my hands, but they remained stretched out obstinately towards the child.

Five yards—four—three. There was the little thing laughing in its innocent glee, for it was expecting some little present from me, who was then calling myself its murderer, and lay there motionless as a statue.

Two yards—one—at last—all over. There was a shock as we dashed down upon the little thing, who seemed to stretch out its hands to mine, and to leap, actually jump, into my arms, and then, with it tightly grasped, we were still going on and on; I with my eyes shut, but feeling that I had the child tightly held to my breast, and yet not able to look to see if it was hurt.

Then I don't know how it was, but I believe I must have got up, and crawled back to my place by the stoker; but I don't know, I can't recollect doing it, only finding myself sitting down there, holding the frightened little child in my arms, and feeling stunned and helpless as a child myself.

'What am I doing of?' I said at last, for my stoker had spoken to me. 'Why, I'm crying,' I said; and so I was crying like some great girl.

We dared not stop to take the little thing back, but we sent it from the next station; and you'll believe me when I tell you, that we were better friends afterwards than ever, so that for long enough we used to make signals, I to the folks at the cottage, and they to me; but I shall never forget that little one getting out upon the line.

IN THE TWILIGHT.

Sits pale Alice in the twilight, at her laurelled lattice there,
Gazing out upon the landscape with a sad and vacant stare:
From below the light wind climbeth with a faint and odorous sigh,
And a white star and a whiter moon hang in the evening sky.

She has sat there very often in the days that have gone by,
With the same calm, mournful bearing, and the same sad, sorrowing eye,
As her heart had lost its object, and her spirit lost its aim,
And as earth was but a dreamland quite, and life an empty name.

What can ail her? wonders Colin, coming nightly from the field,
Who never knew the gloom of heart that falls when spirits yield;
What can ail her? wonders Mary, sturdy Colin's sturdier wife,
Who ne'er allowed a grief to pall in all her checkered life.

But as for him who roameth now in shadow of the firs,
He hath no need to ask her case—his own is like to hers:
Both nurse a silent sorrow which hath never yet been told,
Nor ever will while suns revolve, and human hearts grow old.

POPULAR

LITERATURE, SCIENCE, AND ART

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 274. SATURDAY, MARCH 27, 1869. PRICE 1½d.

THE FIRST COIFFEUR OF HIS AGE.

WHEN the last century was something older than our own, and hair was the great concern of the fair sex, as it is at present, system being their watch-word then, as chignon is now, the arbiter of beauty's destiny was M. Gastelet, of the Rue St Louise, Paris. The house, and even the street in which he lived and did business, have been swept away by the march of modern improvement; but doubtless his fame is still preserved in the high traditions of hair-dressing, for M. Gastelet was a mighty man in his day. Some said that his genius was first revealed to the fashionable world by a hair-dye which he invented for Madame de Pompadour, when that notable lady could appear only by candle-light, lest it should be discovered that she was growing old; some insisted it was through a wig he had fabricated for the Duchesse d'Orleans, which made her oldest friends take Madame la Duchesse for her own grand-daughter. Whatever was the source of Gastelet's power and glory, they grew and increased with systems and surmounting curls, till in the fair morning of Louis XVI., when they called Marie Antoinette the Queen of Hearts, he was undoubtedly the king of heads.

The numbers he had redeemed from grayness before and after the time, were not to be reckoned. The advantageous matches obtained through his skilful arrangement of tresses, false and true, furnished matter of amazement to the Parisian gossips. His heart-breakers and peace-destroyers, as certain curls were called in those days, were believed to do execution worthy of their names, two German barons having committed suicide, and three English lords gone mad, through the cruelty of their fair wearers, not to speak of duels and other desperate doings arising out of the same. What wonder that M. Gastelet's place of business was so besieged by ladies of all ages in and out of carriages, that the Rue St Louise was perfectly impassable for the greater part of the day; what wonder that his correspondence kept three secretaries in constant employment, that his assistants and apprentices formed a sort of household troop, that his agents were an army scattered throughout the provinces, and that M. Gastelet himself thoroughly understood his own importance.

To the use of scissors or curling-tongs, he never condescended; the proudest of grande-dames could get him to visit her hôtel only by falling suddenly sick: in his *bureau de conseil*, as he chose to call his shop-parlour, the great man held a levee every day from twelve o'clock till three, at which ladies were expected to attend and hear his decisions regarding the proper decoration of their heads. There he sat on a crimson-covered *fauteuil*, attired in a morning-gown of blue damask, with satin slippers to match, and a *queue* of *recherché* tie, while round him sat his fair clients, like courtiers round their monarch, and he delivered judgment on each in her turn. 'Madame,' he would say to one, 'your head demands the aspiring style; a towering system, with unlimited curls, pins, and feathers, form your best prospect of success;' to another: 'Madame, you can appear to advantage only in Arcadian simplicity, falling braids and a fillet *à la* shepherdess;' while a third was commanded to be seen in nothing but severe toilets, if she hoped to produce a favourable impression. The wives of ministers and millionaires, the daughters of prefects and farmers-general, ladies whose disputes for precedence had broken up the peace and pleasure of many a ball-room, whose tongues and tempers were the dread of friends and servants, not to speak of their fortunate lords, attended M. Gastelet's levees, received his commands without a murmur, and, what was more remarkable, paid for them in solid louis-d'ors. Great is the power of fashion and vanity, and on their mighty bases Gastelet's power was built, and his fortune likely to grow to princely proportions; at least all Paris thought so, and more than one good family had commenced negotiations with him through matrimonial agents, for the great coiffeur was still unmarried, when all domestic affairs were cast into the shade by a professional difficulty which threatened his prosperity, if not his fame.

Among the Russian nobles who came to reside

Digitized by Google

in Paris immediately after the elevation of Catharine II.'s fourteenth favourite, which was supposed to have made Petersburg too hot for them, was a certain Princess Nareskin, a widow of high connections and some beauty, according to the Russian type. She was also said to be marvellously rich and prudent, and having foreseen the coming danger, to have sold her estates in good time, and vested the proceeds in French and German funds, all but one seat of her ancestors in sixty-five north latitude, with two or three thousand peasants attached, which she kept by way of stake in the holy Russian empire, to return to when her own money was spent, and the empress had changed her mind. In the meantime, Princess Nareskin established herself and suite in a magnificent hôtel in the then headquarters of *ton*, took a box at the Grand Opera, and daily astonished Paris with the splendour of her equipage, and the number of her retainers. The jewellers went into ecstasies over her orders, the milliners had outbursts of enthusiasm, and hotter ones of rivalry on the same subject; and when M. Gastelet was summoned to the Hôtel Nareskin, he thought it worth while to go in person.

The French servants of her Highness—and she had not a few—made known to their acquaintances that his interview with the princess was long and confidential, held with closed doors in her private dressing-room, and with no attendants present but the Tartar dwarf, who understood nothing but Kalmuck, and the Livonian maid, who was deaf and dumb; but when Gastelet returned home, it was evident to the simplest of his *employés* that something of more than common importance occupied the great coiffeur's mind. He spent half-days in a back-room he called his studio, turning over bundles of choice hair, and arranging his most elaborate designs for wigs on the head of a wax-figure, known in his establishment as *la dame de Moscovie*. He sent for his most confidential agents, and was closeted with them for hours; and his goings to the Hôtel Nareskin were frequent enough to serve an ardent suitor for the wealthy widow's hand. The cause of those remarkable proceedings was at length made plain to such of his assistants as he thought best qualified for professional secrecy; and their intimates learned that the Princess Nareskin had come to Paris expressly to engage Monsieur Gastelet's skill on a subject which had foiled all the other coiffeurs of Europe. Her Highness did not choose to make it public, of course; but she was descended from a Polish family, which, in the revolutions and misfortunes of its country, had lost every remnant of inheritance but the plaka. That heirloom had come down to the princess, just when the departure of an experienced husband, and the lapse of a decent time of mourning, had enabled her to contemplate and arm herself for new conquests; but who can conquer with a shaven head? Shaved her Highness's head had to be, in spite of all the efforts of physicians, quacks, and even witches, whom, like a true daughter of the North, she consulted, some being yet to be found among the Finns and Lapps, and their endeavours were equally unsuccessful to make the hair grow again in its accustomed manner. The princess had got wigs of every form and pattern, shade and quality. She had tried them on at mirrors false and true, till her seven maids were exhausted, and herself went off in hysterics; but none of them suited her complexion like her own lost tresses, which, as such cases render necessary, the fire had consumed; and it was an article of faith with her Highness—some people thought the only one she had—that justice would never be done to her youth and beauty till a wig of the same colour, quality, and appearance was duly fabricated and fixed upon her head.

It had been M. Gastelet's boast that with him no hair was matchless, and no peculiarity impossible to suit. He had wigs for the zenith of charms, for the first touch of fading time, and for the latest autumn of beauty. The inconsolable widow could be fitted at his establishment with a coiffure of grief not to be mitigated; and the dame about to cast off her weeds, with one of assuaged sorrow. But in all Gastelet's resources of hair and skill, there was nothing that could or would suit the Princess Nareskin. Her hair, of which she had kept the only preservable portion, and a small one it was, had been neither red nor golden, nor auburn nor flaxen, but a combination of all four; and no other shade could her Highness be persuaded to wear. In vain Gastelet's agents ransacked the provinces, made promises to hair-dealers, posted advertisements on church doors, and sent criers through the remote villages where nobody could read. In vain Gastelet himself frequented the washing-greens on the banks of the Seine, and explored the lowest faubourg, in hopes of finding some head covered with the unmatchable locks. His agents failed, and so did he. The couriers he sent across the frontiers, armed with minute samples of her Highness's hair, and permission to pay anything that was asked for its match, returned empty-handed, and some of them never came back at all. His place of business was inundated by hair-dealers and peasant girls, every one declaring that the tresses they carried in their hands or on their heads were the very thing he wanted, and should be bought without loss of time; and the great coiffeur got into several quarrels and some lawsuits in consequence. The weight of that concern on his mind made him rather uncertain at times in his levees. He enjoined blonde upon ladies who looked perfect scarecrows in anything but raven locks, and equipped two German baronesses in coiffures so remarkably unsuitable, that all Paris thought they must have escaped from some lunatic asylum. Two or three desperate love affairs and several eternal friendships were broken up through these effects of M. Gastelet's pre-occupation. Any one else would have lost caste, and custom through them also. As it was, six ladies came scolding to his shop, and two of them threatened his own queue. 'But what does it matter,' cried M. Gastelet; 'I am in despair.'

The princess was in despair too. Without the hair that did her justice, she could not go to Versailles, then the fortress of fashion and the seat of royalty, where the Russian ambassador was ready to present her, and the ambassador's wife, who had been her rival belle in Petersburg, to triumph over her altered appearance. So the princess sat fast in her hôtel, generally in the private dressing-room, surrounded by her wigs, and despatched hourly messengers to Gastelet with the all-important question: 'Is there any hope?' Latterly, the messengers got for answer only a shake of Gastelet's head. The despair was deepening; an unknown quantity of mineral waters, mixed with *eau de vie*, was required to support the

Digitized by Google

spirits of her Highness; and her household were uncertain whether she would ultimately burn her wigs, and retire to a Greek convent, or proceed on her career of conquest with them all in turn, and never be seen two days together with the same coloured hair, when a ray of hope dawned at once on the princess and the great coiffeur.

Like other men of power and position, M. Gastelet had agents of whom he was by no means proud, and the chief of these unmentioned people was one Martin Brique. Whether Martin was a Swiss, a Bohemian, or a Creole, was supposed to be known to the police, who had paid particular attention to him and his history for the last twenty years, one half of which he had passed in the various prisons of Paris, but nobody else could say; he was a dark-complexioned, dwarfish, monkey-like man, who might have belonged to the undergrowth of any country, and assigned himself to those different nationalities as they happened to suit the exigences of his career. A promise of two thousand livres down, and no questions asked, had set Martin's wits to work; and after scouring Paris and its purlieus to no purpose, he had gone eastward to the Alpine lands of Dauphiné, saying, that if there was odd-coloured hair to be got in all the world one would find it there. Martin had been absent about six months, Gastelet's last courier had come back empty-handed from the Baltic towns, where his last hope had been, and the great coiffeur was sitting in his empty bureau one evening with the feelings of a defeated minister, when Martin Brique made his way in as quietly as he had made it into many a merchant's warehouse and nobleman's mansion, and flourished almost in Gastelet's face a bundle of the long-sought-for, long-despaired-of hair. It was the same, the very match and counterpart of that which the Princess Nareskin had lost by the razor and the fire, and Gastelet felt himself the ruler of heads and the dictator of coiffures once more.

'My dear, my precious Martin!' he cried, folding the remarkably dirty dwarf in his arms, 'where did you find it?'

'I answer no questions, and I want my two thousand livres, monsieur,' said Martin, wriggling out of his embrace: 'you are too much of a gentleman to forget your word of honour.'

Gastelet's dignity was in abeyance for that moment, and could not be offended; he paid the two thousand livres with many expressions of affection and gratitude, to which Martin made no response, but that he would take no paper; and sweeping the silver into his dirty wallet, the successful agent departed, while his more successful employer flew to the Hôtel Nareskin. The princess did not exactly fold Gastelet in her arms, but she called him everything from an angel upward, and being a devout daughter of the Greek Church, gave thanks to her patron saint on the spot, and then demanded that a suitable wig should be fabricated out of what she called the heaven-sent hair, before Gastelet or one of his employés slept.

It is recorded that they did go to rest rather late that night, but were thundered up by her Highness's Cossack footman long before daybreak, to the great alarm of the Rue St Louise, most of whose inhabitants supposed the street to be on fire; but the said footman never left the premises till the wig was finished. There was some difficulty in fitting her Highness's head, which was a Russian one, and not of the smallest size; moreover, by medical advice, it had to be kept strictly shaven, and the nice adjustment of the fastenings was therefore a delicate operation. But M. Gastelet's own skilful hand accomplished the feat; the princess was at length wigged to her mind. She paid like a princess; and he went home to repose on his laurels, or at least in his bed; the first quiet sleep himself and his household had had for nearly sixty hours. As for her Highness, she went to the Grand Opera the same evening, and on the following day to Versailles, where the Russian ambassador presented her to the queen; and his wife fainted with envy at the sight of her recovered hair. From that day, the Princess Nareskin was seen, heard of, and admired in every gathering of rank and fashion. There was not a penniless scion of nobility—and such olive branches were by no means rare in France at the time—who did not hope to win the rich and gay widow—there was not an unmarried prince of the blood whom she did not hope and endeavour to snare. Royal favour increased her chances; she was included in the king's hunting-parties, and invited to the queen's Trianon. The French court had a small vendetta just then against the Empress of all the Russias and her fourteenth favourite, and took that opportunity to shew it.

The Princess Nareskin became the reigning foreign belle, an article never wanting to the *beau-monde* of France since foreigners first began to spend their time and money in its society. There was the usual wonder, gossip, and semi-scandal about her; the fashion she set, the duels she caused, and the matches she was about to make, furnished topics to the coteries and *on-dits* to the wits. In common with all belles of home or foreign growth, she was admired by the men and hated by the women; but both admirers and haters agreed that her Highness had very remarkable hair. Its suitability to her complexion, its length and luxuriance, and the variety of styles in which she was accustomed to have it dressed, disturbed the peace, and perhaps the temper, of many a court beauty. The secret of its origin was better kept than that of most locks of the kind: none but Russian maids were allowed to know it, and being serfs' daughters, without a word of French among them, they had no chance of enlightening the backstair people of noble houses; Gastelet and his assistants had the bond of professional honour and considerable profits to insure their silence; moreover, the great coiffeur had his doubts about the manner in which his unmentioned agent, Martin Brique, had come by the bundle of hair which he presented to him that evening in his solitary bureau. Martin's agency and other doings had been brought to a close about six weeks after, by the knife of a brother Ishmaelite, with whom he had had a quarrel in the Faubourg St Antoine, and the best policy was to let the whole transaction rest with him in the cemetery of the Innocents. So the princess had her hair dressed in the most recherché and varied modes, heard compliments on its beauty with an unconscious simplicity of manner, which everybody said was charming, and refused a single curl to the prayers and vows of many a high-born admirer, with a dignity and composure perfectly natural.

No rival star having risen on the fashionable horizon, her conquering career continued to another winter, always the gayest season in Versailles; but the unprovided-for branches of nobility who had

Digitized by Google

hitherto sighed around the fair and well-dowered widow, saw a cloud come over their prospects, for the whisper went that Madame la Princesse had positively captivated the Duc de Chartres. He who lived to be called Egalité, and vote for the death of Louis XVI., was even then in the condescending and popular line, ready to forget his royal blood, and generally in want of money; whereupon Madame Nareskin had hopes, and her less exalted lovers great cause of fear. The hopes and the fears were subjects of remark to the entire court and its following, assembled on a certain evening, late in December, to see a new play, pronounced to be of exciting interest at the time, but long ago forgotten. The theatre of Versailles, which was built by Mansard for Louis XIV., has undergone many alterations since that play was new and applauded; but at the time, it retained its pristine form, a sort of outlying wing of the great palace; and its most select boxes were situated at the end, immediately adjoining a private chapel, which the Grand Monarque had fitted up for himself in his old and devout days, by way of having his bane and antidote both before him. In one of those select boxes sat the Princess Nareskin. Next to the royal one, it was the most select and costly in the house; there, according to tradition, Louis le Grand used to sit alone with Madame de Maintenon, when in ill-humour with all the rest of his rather large family. The rich Gobelins tapestry with which it was lined, the inlaid mirrors and brocade curtains, belonged to his stately and expensive time; and the lady who sat within seemed worthy of them, from her lace and satin-covered hoop, at least four yards in circumference, to her towering coiffure, a pile of curls and a blaze of diamonds.

It was a night of triumph to her as well as to the author and the actors of that long-forgotten play. The duke had been casting glances of adoration in the direction of her box, all through a scene of precise and long-winded love-making, such as charmed the critics of the period; the princess thought she heard them call her Duchesse de Chartres, and, fully determined to rivet the chain of enchantment, was bowing her head with strong but graceful emotion as the curtain fell on the parted lovers, when something seemed to clutch the tower of curls and diamonds. Madame Nareskin started up with a true Russian bound, and from boxes, pit, and gallery burst a mingled shout of astonishment and laughter, for curls and diamonds all were gone, and the reigning belle, in the splendour of her evening-dress, stood with a head as clean shaven as that of a Capuchin!

Madame Nareskin immediately went off in strong hysterics—what less could woman do under the circumstances? but at the same moment several ladies, in different parts of the house, followed her example; and in wild exclamations and frightened whispers the tale went round the theatre, that a long bony hand had been seen to grasp the jewelled coiffure, now known to be a wig, and vanish with it nobody knew how. Some said the hand was black, and had claw-like nails; some said it was white and fleshless as that of a skeleton: one was certain it had come up through the floor of the box, with a wonderfully long arm, bare and black; another swore it had come down through the ceiling; and a third asserted that he had seen it dart straight out of the wall. The house was in confusion not to be brought to order; ladies were carried out screaming in all directions, and among them the wigless princess. Men with stars and ribbons on their breasts were making remarkable haste to get out; and some pious or timid souls made vows then and there against entering a theatre for the rest of their lives. Even royalty did not feel inclined to sit; it was whispered that the queen and Madame Elizabeth had both seen the hand come out of the wall: at anyrate, the royal box was frightened as much as the subject ones. The performance was stopped at once, and the audience hurried to their homes, to wonder, to frighten each other, and to talk over the abrupt disappearance of Madame Nareskin's hair.

It is said that the princess's first inquiry, on her return to consciousness, was for her diamonds; and when told how they had been seen to go, she raised such an outcry about thieves robbing the widow and the stranger, as, with the help of her Cossack and Tartar servants, roused the *commissaire* of police, who got the theatre searched from garret to cellar; but no trace of diamonds, wig, or thieves could be found. The police, according to custom, arrested everybody connected with the theatre, and everybody else of whom they had the slightest suspicion. For weeks after, they were engaged in the investigation of the whole affair. It was said the court, and especially the queen and Madame Elizabeth, were particularly anxious to make out the agency by which Madame Nareskin's coiffure had disappeared; but examination and inquiry alike failed to fix the blame on any one of the arrested. People of all classes testified to having seen the hand clutch the princess's headdress and bear it away; but their testimonies were found so conflicting on every point regarding its colour, size, shape, and the direction whence it came, that they could be received only as evidences of the varied powers of light, shade, and imagination.

The police could discover nothing except that a trick of extraordinary cleverness had been played off on the Russian princess and the public of Versailles, the secret of which must remain for some happy accident or fortunate commissaire of future time to unravel. But the scores who had seen the mysterious hand, and the thousands who heard of it, were not disposed to accept that official explanation. The age was a fermenting one; under its fashion, frivolity, and philanthropic schemes, the first French Revolution was a-brewing; while breaking away from old beliefs and habits of thought, it had a strong inclination to the supernatural, as Cagliostro and the Rosicrucian doings made manifest. Who first suggested the idea to Madame Nareskin's mind was not distinctly known: some said it originated among her Russian maids; but when the police had searched their utmost, and found no clue to the mystery, she declared her opinion that the hair so long sought and so triumphantly worn had been obtained by murder, and torn from her head by the unresting ghost. That the ghost should have carried off her diamonds also, was explained by the confessor for whom she sent in post-haste to the nearest Greek monastery. He made it clear to her Highness that the loss of the gems was a signal judgment for wearing the crime-purchased wig; and such a tangible token of divine displeasure telling powerfully on her Russian mind, the princess directly betook herself to the most reliable austerities of her Greek Church, and talked of

Digitized by Google

making a pilgrimage to kiss the feet of the dead and dry saints in Kiev—a sovereign remedy for troubled consciences in the North. But Madame Nareskin's conscience belonged to the order that never get troubled without bringing other people into trouble too. M. Gastelet had got the hair and made the wig; he was doubtless guilty of the crime, and she and her Greek confessor united in denouncing him to the police.

The mysterious disappearance of Madame's coiffure was known in M. Gastelet's bureau soon after it occurred. He had always entertained some doubts of the hair being lawfully obtained; the higher the wonder and gossip about the lost wig rose, the more he felt himself compromised, and when warned of his danger at the eleventh hour, he could think of no resource but to hide himself in the attic of his own house. Gastelet was great in his levee, great in his shop, and great in the whole art of wig-making, but very small in things that lay beyond them. The police searched for and found him in the attic; and they had therefore got something to go upon, to the immense satisfaction of the commissaire. That gentleman did not accept the solution which the princess and her confessor gave to the problem that puzzled him and his; but keen and careful inquiry had made him aware that some mystery had attended the getting up of materials for the lost wig: a charge of murder had been preferred against Gastelet, and if not guilty, why did he hide himself? To work the commissaire and his assistants went in their usual fashion: Gastelet was imprisoned, examined, and spied upon; he denied the crime of course—the police were accustomed to that; but he could give no account of how or where the singular-coloured hair had been procured, except that it was brought to him by Martin Brique, a bad character, and now beyond the reach of warrant or question.

The accusation and arrest of the great coiffeur added a new element of wonder and sensation to the tale, which was by this time exercising the tongues and wits of all France, particularly the upper circles, among whom Madame Nareskin had so shone till that strange eclipse came over her. Those who laughed at the idea of a ghost abstracting a lady's wig in full evening splendour, diamonds, feathers, and all, were yet prepared to believe in the coiffeur's guilt as firmly as the police. The long and fruitless search which Gastelet had made for the hair to suit her Highness, though kept secret at the time, was now revealed by his agents and couriers, every one anxious to exculpate himself from any share in the criminal transaction. The silence which he had observed on the subject of his ultimate success, and his present unsatisfactory account of it, not to speak of his concealment in the attic, all weighed against him in the public mind.

The hairdressers of every order and degree, who hated him with one accord, did their best to strengthen the general impression; there was not one of their shops in Paris or Versailles that had not a version of Gastelet's crime, with full particulars of how and where it had been committed; and the specified victim belonged to all sorts and conditions of mankind, from a gipsy girl of the Spanish frontier, to a count's daughter receiving her education in a convent of Alsace. His employer, Madame Nareskin, did not escape her share of the blame, her princely admirer had got a sight of the clutching hand, and whence he supposed it to come was never made public; but he took an early opportunity to suggest that Madame's Russian penances were not for nothing, and that she must have had art and part in the getting of the hair. The commissaire of the police was of the same opinion. Madame Nareskin was placed under surveillance, secret and circumspect as befitted her rank, which justice much respected in those days; but it was known that the princess was not to quit French territory, however well inclined to resume her travels, that her previous history had been minutely searched and sifted, and that some curious facts had been brought to official light.

Never was murder more firmly believed in, or condemning evidence more anxiously waited for by a discerning public. It could not be got, with all their search and inquiry; the police for once, like the rest of mankind, found everything but what they wanted. Gastelet had no other story to tell; but between the frequent examinations in and out of prison, the company of warders and spies, the frightenings he got from authorities, and the exhortations he got from monks, the poor fellow's mind, never particularly strong except on wigs and systems, became muddled to the degree of almost believing himself guilty, and he would probably have confessed according to the next examiner's views, if a circumstance had not happened to give the whole case a new complexion.

The commissaire of police was sitting in his private office one day, reading over the last report of his most efficient prison-spy regarding Gastelet's sayings and doings, when a fiacre stopped outside, and the official heart bounded for joy as his servant came in to say that a stranger who could give information concerning the accused hairdresser waited at the door. 'Admit him,' said the commissaire; and in walked a priest, evidently from some distant province, leading by the hand what seemed to be a young nun, deeply veiled, and carrying a parcel carefully wrapped up. At a few words from the priest in the tongue of Upper Dauphiné, she advanced to the table at which the commissaire sat, rapidly unfolded her parcel, and laid down before him the identical coiffure wrenched off the head of Madame Nareskin in the Versailles theatre, with its system curls and diamonds all complete; then ran to the nearest corner, crouched down, and began to cry. The priest soon pacified her with his mountain patois, and related to the commissaire in good French, for he had been educated at the Sorbonne, her unhappy story. She was the daughter of a noble Dauphinese family, but a *crétine*, and placed by them in an ancient convent of Franciscan nuns, which, being situated in a remote Alpine valley, had preserved a custom common to monastic houses in the middle ages, and kept within their walls an asylum for the female insane of the district. The convent had never been a flourishing one, and its revenue was chiefly derived from that source; but the nuns were old and few, and had to take as assistants in the management of the asylum three or four robust women, one of whom happened to be the sister of Martin Brique, a native of the Swiss frontier. Claudine—such was the only name by which the crétine daughter of a noble house was allowed to be known in the commissaire's published Report—was one of their best paying patients, and remarkable for more than ordinary cunning, dexterity of hand, and the pride she took in the uncommon-coloured hair which now formed the wig, and had once been her own. In an evil hour, Martin

Digitized by Google

Brique, incited by Gastelet's promise of two thousand livres, found his way to the convent; and his sister, unable to resist the prospect of one thousand, which he promised to her, but never paid, assisted him in decoying poor Claudine into the neighbouring forest, where he cut off her valued hair almost at the roots, and set off with it to his employer in Paris.

Claudine could not give a correct account of her loss to the guardian nuns, whose oversight age had made somewhat slack; but with the keen perception sometimes found to exist in otherwise deficient minds, she guessed the route Martin had taken, and, in spite of his sister's vigilance, contrived to escape from the convent. The nuns and their assistants searched for her in vain throughout the mountain country, so did her family; and months after, when both had given up the search in despair, Claudine returned, much exhausted by hunger and hardships, but bringing with her the magnificently dressed and jewelled wig made of her own stolen hair. That in so long a journey she had been able to keep it and its gems from the thousand covetous eyes and hands to be met with in town or village, the nuns thought was wholly due to the special interposition of their patron saint, though the priest thought her natural cunning might have somewhat assisted it. He was the curé of that Alpine parish, and it cost him and the good nuns some months to get out of Claudine, how, following Martin Brique's track, she had begged her way to Paris, saw her own hair by accident on the head of a great lady, followed that lady about everywhere unnoticed, till she got an opportunity of plucking the wig off her head, in a place which she described, but they could not understand. It was their united opinion that the diamonds sparkling among the curls and feathers must have belonged to the queen of France; and the priest was thinking how to restore them to her Majesty, and save Claudine from punishment, when a traveller whom he entertained one stormy night, presented him with a Paris journal containing the whole story of Madame Nareskin's loss and Gastelet's arrest. To save an innocent man from the consequences of so dark an accusation, he directly set out for Paris, taking Claudine with him, by consent of the nuns, that she might make the case clear, by shewing the commissaire how and where she had contrived to wrench off the princess's wig.

Claudine did clear up the case, and gave a wonderful example of crétine cunning, by shewing the commissaire what he and his assistants had never dreamed of. The long-disused chapel of Louis XIV. had a low and broken window, through which she had managed to creep; it had also a small door, by which majesty had found its way from the theatre to devotion, but long forgotten and completely concealed by the rich tapestry lining the box in which Madame Nareskin sat to see the new play, when Claudine contrived to open it behind her, draw aside the tapestry, and possess herself of the wig. The story of the ghost and the murder was thus exploded, to the deep disappointment of the public. The princess identified her lost coiffure with not a diamond missing, but was not quite satisfied because nobody would punish the crétine girl, whom the good priest took safely back to the convent of St Francis, from which it is said she never wandered again. The laugh rose on all sides against her Highness; what was worse, her belleship was ruined by the exhibition in her box on that eventful night; and a German duchess reigned in her stead; so Madame Nareskin retired to Vienna, where play was then deepest, gave up conquest, and took to cards. Gastelet was liberated, of course without a stain on his character; but he had lost caste by getting into the hands of the police, and some attributed to that event the sudden change of fashion which abolished systems with all their towering structures, and made flowing hair the mode. His occupation was gone; and perhaps he had enough of wig-making; but out of the wreck of his business and fortunes he collected enough to live upon in the quiet old town of Narbonne, where he had been born. There the man so tried and talked of passed out of the public mind; but he came to the sunset of life in peace, having survived court, throne, and revolution, and never forgot that he had been the first coiffeur of his age.

THE LAST RECORD OF LORD BYRON.

'A GREAT book,' says the sage, 'is a great evil,' and, in the case of a book in two great volumes, the remark has double force. These long-promised *Recollections of Lord Byron*, by the Countess Guiccioli, might be compressed with advantage into a single duodecimo. A series of chapters, headed 'The Constancy of Lord Byron,' 'The Modesty of Lord Byron,' &c., would have been a dangerous experiment even in a biography of Lucretia; but with such a subject as his Lordship, this sort of treatment is simply ridiculous; when they come to 'The Mobility of Lord Byron,' most readers will think it time to stop. The title of the work too is a misnomer: the personal 'recollections' are very few: the quotations from other biographies of the poet are interminable. Yet surely, since the Countess Guiccioli thinks it necessary to put forth so stupendous a monument of the departed, the inscription might have been made better worth reading. We have the word of a trustworthy and intimate friend of his, that her influence over him was great, and for good; from a most ignoble course of life at Venice, says Shelley, she saved Byron, and ever afterwards exerted over him an excellent influence. Yet nothing of this is gleaned from the work before us; the present authoress must be in possession of letters, opinions, interesting facts of this great man, such as no other living person has to boast of: she is continually scolding Moore for having destroyed those private papers, the publication of which would have whitewashed the poet's reputation; and yet she herself makes no effort to set him right with posterity. She abuses Moore and Macaulay for their descriptions of her Idol, and she does not spare his dead widow, but she adduces no proof of the correctness of her own view, that his Lordship was almost an angel.

The brief space devoted to 'The Faults of Lord Byron,' is filled with the virtues omitted in the chapters of avowed panegyric; yet we cannot be blind to the fact that these are matters of assertion. The corroborative testimony of names and dates is almost always wanting. That Lord Byron was capable of acts of noble self-denial is certain: that he may now and then have dismissed very charming young ladies, who, enamoured of his fame and beauty, came privately to consult him about their manuscript verses, with the most excellent advice and a

Digitized by Google

paternal salute upon their brows, is also possible; but really, from the countess's account, one would think he was editor, trustee, and friend of the family to half the pretty girls in England, and that his conduct throughout was strictly professional, dashed with a wise benevolence. When young women, married or single, fell in love with him—which seems to have happened about 'once every quarter of an hour'—he always fled from the temptation; upon one occasion, he even 'declined to go to Asia,' lest he should disturb certain family relations by his presence in that continent. In fact, if among the male sex there was ever 'a dragon' in the matter of virtue, it was my Lord Byron. Apart from this absurd exaggeration, there is no doubt that half the vice imputed to the Man arose from the looseness of the Poet, and perhaps a good deal of the other half to Lord Byron's own affectation in making himself out as bad as he could. Mr Finlay, who knew him well, declares *that he not only calumniated himself, but hid his best sentiments.* This remark is quoted by his present biographer with evident triumph; she imagines it shews his hatred of hypocrisy; but hypocrisy has been well defined to be the homage which vice pays to virtue, and the vice that declines to pay it, is not always of the least objectionable sort. 'We are forced to confess,' says his present biographer, 'Byron had one great fault: it consisted in a species of *cruelty* towards himself, *a positive necessity of calumniating himself.*' It is most amusing to read the querulous complaints of the countess at Lord Byron's having been taken at his word in this matter; as though a successful Genius, and the handsomest man of his time, could possibly expect a greater charity from his contemporaries than he exhibited towards himself. She appeals (through her English translator) to 'the great and moral feeling that pervade [*sic*] the two last cantos of *Childe Harold;*' to Moore's remark, that the lines on the Death of Thyrza are 'far too beautiful and too pure to have been inspired by a mortal being;' and finally even calls in the aid of orthodoxy in the person of 'the very Rev. Dr Stanley, Dean of Westminster,' as a witness to the spirituality, not of Lord Byron, but of his Hebrew Melodies.

The truth is, as respects the Libertinism attributed to Lord Byron, it was grossly though not malignantly exaggerated; and besides, perhaps scarcely any man has ever been so attractive to the fair sex. In the first place, he was a lord; in the second place, he was supremely handsome; and in the third place, his fame, whether wholly deserved or not, was something of which those who did not live in his time can form no conception. The system of advertisements had not then attained its present dimensions, but he was advertised—gratuitously and by word of mouth—as no author has been before or since. His domestic squabbles, his antagonism to established opinion, and his supposed dissolute mode of life, all helped to make his reputation with the ladies. With regard to his personal appearance, there is considerable information afforded in the present work. For feature and expression, though it was very pale, the beauty of his face seems to have been absolutely unrivalled. It struck men as much as women. His eyes were so luminous and expressive that Walter Scott compared his young rival's head to 'an alabaster vase lit up by a lamp within.' 'No portrait,' says Dallas, 'has done him justice; the charm of expression and the grace of movement, were beyond the power of the brush to render. 'Of his face,' says Moore, 'the beauty may be pronounced to have been of the highest order, as combining at once regularity of features with the most varied and interesting expression. His eyes, though of a light gray, were capable of all extremes of expression, from the most joyous hilarity to the deepest sadness, from the very sunshine of benevolence to the most concentrated scorn or rage. But it was in the mouth and chin that the great beauty as well as expression of his fine countenance lay. His head was remarkably small, so much so as to be rather out of proportion with his face. The forehead, though a little too narrow, was high, and appeared more so from his having his hair (to preserve it, as he said) shaved over the temples. Still the glossy dark-brown curls, clustering over his head, gave the finish to its beauty. When to this is added that his nose, though handsomely, was rather thickly shaped, that his teeth were white and regular, and his complexion colourless, as good an idea perhaps as it is in the power of mere words to convey may be conceived of his features. In height he was, as he himself has informed us, five feet eight inches and a half, and to the length of his limbs he attributed his being such a good swimmer. His hands were very white, and, according to his own notions of the size of hands as indicating birth, aristocratically small.' As to his intellectual expression, Scott remarks: 'Of poets, I have seen the best that this country has produced, and although Burns had the finest eyes that can be imagined, I never thought that any man except Byron could give an artist an exact idea of a poet. His portraits do not do him the least justice. The varnish is there, but the ray of sunshine is wanting to light them up. The beauty of Byron is one that makes one dream.'

In his novel of *Venetia*, Mr Disraeli also gives a truthful and elaborate description of Byron's appearance, under the name of Hubert. No wonder, then, since it even moved men to admiration, that all women were attracted by Byron's beauty, including even his wife. Moore once asked Lady Holland whether she thought that Lady Byron had really ever loved her husband. 'Could it be otherwise?' replied she. 'Was it possible not to love so lovable a creature? I see him now, surrounded as it were by that great light: oh, how handsome he was!'

With respect to his lameness, we are assured by his present biographer that 'no defect existed in the formation of his limbs: his slight infirmity was nothing but the result of weakness of one of his ankles.' As for the emaciation of his legs, as evinced by the post-mortem examination, that was 'brought on by his habit of ever being on horseback.' A curious illustration of this subject has lately appeared in the newspapers. 'Mrs Wildman (the widow of the colonel who had bought Newstead) has lately given to the Naturalist Society of Nottingham several objects which had belonged to Lord Byron, and amongst others his boot and shoe trees. These trees are about nine inches long, narrow, and generally of a symmetrical form. They were accompanied by the following statement of Mr Swift, bootmaker, who worked for his Lordship from 1805 to 1807. Swift is still alive, and continues to reside at Southwell. His testimony as to the genuineness of the trees, and to the nature of Lord Byron's deformity, of which so many contradictory assertions have circulated,

Digitized by Google

is as follows: "William Swift, bootmaker at Southwell, Nottinghamshire, having had the honour of working for Lord Byron when residing at Southwell from 1805 to 1807, asserts that these were the trees upon which his Lordship's boots and shoes were made, and that the last pair delivered was on the 10th of May 1807. He moreover affirms that his Lordship had not a club-foot, as has been said, but that both his feet were equally well formed, one, however, being an inch and a half shorter than the other. The defect was not in the foot, but in the ankle, which, being weak, caused the foot to turn out too much. To remedy this, his Lordship wore a very light and thin boot, which was tightly laced just under the sole; and, when a boy, he was made to wear a piece of iron with a joint at the ankle, which passed behind the leg, and was tied behind the shoe. The calf of this leg was weaker than the other, and it was the left leg. (Signed) WILLIAM SWIFT."'

Lord Byron had a way of walking, remarks Galt, that made his lameness almost imperceptible, and indeed he spent several days with him on shipboard without discovering the fact. That he was not morbidly sensitive to the defect, as is generally supposed, we have, for once, his biographer's own testimony, instead of a quotation from other people. 'Once at Genoa, he walked down the hill of Albaro to the seaside with me, by a rugged and rough path. When we had reached the shore, he was very well and lively; but it was an exceedingly hot day, and the return home fatigued him greatly. When home, I told him I thought he looked ill. "Yes," said he, "I suffer greatly from my foot; it can hardly be conceived how much I suffer at times from that pain;" and he continued to speak to me about this defect with great simplicity and indifference. He used often to laugh at it, so superior was he to that weakness. "Beware," said Count Gamba to him on one occasion whilst riding with him, and on reaching some dangerous spot—"beware of falling and breaking your neck." "I should decidedly not like it," said Byron; "but if this leg of which I don't make much use were to break, it would be the same to me, and perhaps then I should be able to procure myself a more useful one."'

It is a pity that our authoress does not occasionally permit herself to deviate into commonplaces of this sort, which at all events afford a definite idea of what she intends to convey; it is no use her telling us that the influence of the Norman Conquest has shewn itself in no noble individual so much as in Lord Byron, who, 'belonging to the Gallic race (modified by the Latin and Celtic elements),' evidenced this genealogical mixture in his moral and intellectual character. This requires, as the Americans say, to be 'fried' before it can be rendered intelligible. If the people about Lord Byron, indeed, were accustomed to speak of him in this style, it is no wonder that folks at a distance got very misty notions of him. That the lies invented about his Lordship were, however, most monstrous, there is no doubt. Even the great Goethe indulged himself with a most abominable critique upon *Manfred*, which perhaps he considered owed some of its beauties to his *Faust*.

Byron's own criticisms, although never attaining this extremity of extravagance, were singular and unjust enough. The fact is, his intellect, although so powerful, was so subjective, that it considered all things in their relation to himself. A spoiled child from the beginning, he remained so to the end, whether on the heights or in the depths of fortune. A more egotistic man, as it seems to us, never existed; though he was, on occasion, capable of self-sacrifice. When his gondolier was drawn for the conscription, he not only paid the sum (and he was ordinarily generous in mere money matters) requisite to buy him off, but even delayed a proposed journey in order to arrange the affair (since there was a necessity for it) in person. But this gondolier was a favourite servant, and Byron would do anything for those who were personally attached to him. His judgment was warped by affection, at least as much as by prejudice. He once amused himself by drawing a 'triangular *gradus ad Parnassum*,' in which he thus classifies the position of contemporary poets—all his personal friends at the top, and the others nowhere. Walter Scott is at the apex; in which opinion he may, at that time, have had many to agree with him. Then, a long way down, but still second, and all by himself, Rogers! Below him, Moore and Campbell together; and below *them*, Wordsworth and Coleridge!! Perhaps, since they were living together at the time, Shelley was omitted from this remarkable verdict: but Keats (over whom no intelligent person would now dream of placing Rogers) is also left out. He was never brought within Byron's personal circle, and therefore had to die before that tardy eulogium was pronounced: 'His fragment of *Hyperion* seems actually inspired by the Titans, and is sublime as Æschylus.' Byron afterwards gave out that his indignation against Keats's depreciation of Pope had not permitted him to do justice to the young man's genius.

Notwithstanding Byron's close intimacy with Shelley, his religious opinions, at all events in later life, seem to have been more orthodox than they are supposed to have been. He naturally protested against those sentiments being considered as his own which he placed in the mouth of 'the first murderer,' *Cain*. 'I, of course,' says he, 'embody myself with the character while I draw it, but not a moment after the pen is off the paper. I am no enemy of religion, but the contrary; and as a proof, I am now educating my natural daughter a strict Catholic in a convent of Romagna.' Indeed, he would not permit her to remain under the kind and feminine superintendence of Mrs Shelley, lest her feelings upon religious subjects might be disturbed by the conversation of the author of *Queen Mab*.

One of the most interesting portions of these so-called *Recollections* is, where we have pointed out to us those passages in Lord Byron's poems wherein he paints himself. These occur, for the most part, in *Don Juan:*

> His manner was perhaps the more seductive,
> Because he ne'er seemed anxious to seduce;
> Nothing affected, studied, or constructive
> Of coxcombry or conquest: no abuse
> Of his attractions marred the fair perspective,
> To indicate a Cupidon broke loose,
> And seem to say: 'Resist us if you can'—
> Which makes a dandy while it spoils a man.
>
> By nature soft, his whole address held off
> Suspicion: though not timid, his regards
> Was such as rather seemed to keep aloof,
> To shield himself, than put you on your guard.

Serene, accomplished, cheerful, but not loud,
Insinuating without insinuation;
Observant of the foibles of the crowd,
Yet ne'er betraying this in conversation;
Proud with the proud, yet courteously proud,
So as to make them feel he knew his station
And theirs:—without a struggle for priority,
He neither brooked nor claimed superiority.

That is, with men: with women he was what
They pleased to make or take him for.

There was the purest Platonism at bottom
Of all his feelings.

Without arguing the question of pure 'Platonism,' which is a somewhat delicate one, the assertions of his present biographer as to the sort of charms which were most pleasing to Lord Byron in the fair sex, are at variance with the statements of his other biographers. 'He felt no attraction,' says she, 'to that style of woman since called "fast." . . . . In order to be truly loved by Lord Byron, it was requisite for a woman to live in a sort of illusive atmosphere for him, to appear somewhat like an immaterial being, not subject to vulgar corporeal necessities. Thence arose his antipathy (considered so singular) to see the woman he loved eat.' It must be added, that he himself combined example with precept in this matter, since he never touched meat, and complained that a dinner which consisted of fish and a pint of Bucellas, made him heavy and stupid: when he beheld Moore consuming a beefsteak with gusto, he regarded him attentively for some moments, and then inquired gravely: 'Moore, does not this eating of beefsteaks make you ferocious?'

It was 'her air of modesty and reserve,' remarks the countess upon this subject of Byron's fastidiousness, 'that first drew him towards Miss Milbank.' And this confession is the more remarkable as it is the only compliment which that lady receives throughout these volumes. The chapter devoted to 'Lord Byron's Marriage, and its Consequences,' although a very bitter one, is by far the most striking part of their contents; and although an *ex parte* statement, deserves to be heard, since the other side has had the ear of the public for so long. Indeed, at this present time, in the admirable volume of *Biographical Sketches* just published by Miss Martineau, we have the plaintiff's case thus strikingly stated. 'Never was a young creature' [she is speaking of Miss Milbank] 'led to the altar more truly as a sacrifice. She was rash, no doubt; but she loved him, and who was not, in the whole business, more rash than she? At the altar, she did not know that she was a sacrifice; but before sunset of that winter day she knew it, if a judgment may be formed from her face and attitude of despair when she alighted from the carriage on the afternoon of her marriage-day. It was not the traces of tears which won the sympathy of the old butler who stood at the open door. The bridegroom jumped out of the carriage, and walked away. The bride alighted, and came up the steps alone, with a countenance and frame agonised and listless with evident horror and despair. The old servant longed to offer his arm to the young lonely creature, as an assurance of sympathy and protection. From this shock she certainly rallied, and soon. The pecuniary difficulties of her new home were exactly what a devoted spirit like hers was fitted to encounter. Her husband bore testimony after the catastrophe, that a brighter being, a more sympathising and agreeable companion, never blessed any man's home. When he afterwards called her cold and mathematical, and overpious, and so forth, it was when public opinion had gone against him, and when he had discovered that her fidelity and mercy, her silence and magnanimity, might be relied on, so that he was at full liberty to make his part good, as far as she was concerned. Silent she was, even to her own parents, whose feelings she magnanimously spared. She did not act rashly in leaving him, though she had been most rash in marrying him. As long as others called him insane, she was glad to do so too; and when she left him for her father's house, she regarded him as mad. When Dr Baillie and other physicians whose opinions were asked (not by her) declared him sane, she still abstained from acting on her own impulses or judgment. As the published correspondence made known, the case was submitted, in an anonymous form, to Dr Lushington and Sir Samuel Romilly; and the unhesitating decision of these two great lawyers and good men was, that the wife—whoever she might be—must never see her husband again. When they knew whose case it was, they did not swerve from their first judgment, but declared that they would never aid or countenance Lady Byron's return to her husband.'

The case for the defendant is stated in the work before us. From it we learn that, at first, the Byrons got on together well enough, notwithstanding that they were as opposite in temperament, opinions, and habits as two persons well could be; but her Ladyship was a slave to rule, and as inflexible as the figures she loved to study. She could not do without the comforts 'so generally appreciated and considered necessary by English people;' and for which Lord Byron had certainly no taste. His long sojourn abroad had given him foreign habits. He did not dine every day, and when he did dine, it was upon some (to her) objectionable dish. He swallowed his breakfast, which consisted of a cup of green tea, without sugar, and the yolk of an egg, standing, which naturally scandalised a young person who liked a tea-urn; while she, on her part, considerably disgusted him by asking, three weeks after marriage, *when he intended to give up his habits of* VERSIFYING. If this last remark was really made, it was itself sufficient to explain the subsequent separation; but there was, as it seems, an abundance of other reasons. Lady Byron was 'extremely jealous,' and placed a female spy over her husband's actions. She forced open his writing-desk, and found in it several proofs of intrigues that had taken place *previous* to his marriage, and in the frenzy of her jealousy, even sent one packet to the husband of the lady compromised. Altogether, there were worse than faults on both sides, and it is not to be wondered at that this ill-assorted pair soon separated. In the eyes of the present biographer, 'the cold companion who brought him ruin for her dowry,' as he says in his *Prophecy*, was really the cause of all his woes. 'If I had been the husband of the Countess G——,' said he, a few days only before setting out for Greece, 'we should have been cited, I am certain, as samples of conjugal happiness, and our retired domestic life would have made us respectable.' But, with all due respect for this independent but anonymous witness, we do not think that 'respectability' would have been Lord Byron's fate under any

Digitized by Google

circumstances. As an appendix to this curious observation of the biographer, we presently read, among other reasons for Byron's unpopularity in England, that 'his admiration for foreign beauties wounded feminine self-love at home.'

The singularity of these *Recollections of Lord Byron* extends to the translator: it may be forgiven to the Countess Guiccioli that she does not know that Cheltenham is an inland spa; but the gentleman that puts her work into an English form should not have admitted this passage: 'He shewed at an early age his disposition to a poetical turn of mind by his meditative wanderings in Scotland among the mountains, and *on the seashore at Cheltenham*.' Is it possible, then, that the famous Address to the Ocean was evoked by the contemplation of the Cheltenham Waters?

AN ADJUTANT'S DUTIES.

I HARDLY knew whether or not my good star was in the ascendant, when, on the occasion of 'Straps' obtaining his captaincy, our good colonel offered me the appointment of adjutant. To the uninitiated in the matter, it may appear that the 'proud position,' to say nothing of the addition of some three shillings and sixpence to his not superabundant pay, would make the idea a welcome one to a needy subaltern; but there were other considerations which it is necessary to explain.

I believe (for it is not necessary for an adjutant to have a classical education) that, according to its Latin derivation, the word adjutant signifies 'helper'—not in a *stable* point of view, for I have nothing to do with the colonel's horses, but keep one of my own, upon which I flatter myself I make a rather good appearance at parades and reviews; but, in the words of the military authorities on the subject, I am the 'mouthpiece of the commanding officer;' I am to have charge of young officers and recruits, whom to instruct in their drill, and for whose efficiency I am answerable; I am to superintend the drill and discipline of the regiment generally; to me are to be addressed, for the commanding officer's consideration, letters from the various departments of the regiment; and by me, or in my name, must the commanding officer's opinions and directions be conveyed to the regiment at large; and all the rest is left to my 'zeal and discretion!' This is a 'large order,' and it seemed especially so to me, when, in my young days, I was offered the appointment. But the pride of being selected from some thirty other subalterns, the additional pay, the forage for a horse, and, above all, the hope that I might really do well, and bring credit to the regiment by the manner in which I discharged my duties, outweighed the considerations of my youth, inexperience, natural laziness, and the fact that my promotion might be productive of the envy, if not dislike, of my brother-officers, with whom, I flattered myself, I had hitherto been popular.

The adjutancy is very often held by an officer who has been promoted from the ranks. This is well in many respects; but yet the arrangement is not altogether advisable. The adjutant from the ranks is undoubtedly a first-rate 'drill' (he has probably been regimental sergeant-major), and bears a first-rate character for intelligence and integrity, or he would not have been so promoted; but, on the other hand, he has to be the adviser, to a certain extent, of the colonel; he is his 'go-between,' and, upon occasion, has to convey censure to officers, senior and superior in rank to himself. In this capacity it is necessary that he should be a *gentleman*. Moreover, with the non-commissioned officers and privates of the regiment, an adjutant from the ranks is seldom popular. He is too strict with them. He is (from experience) 'up to all their little games,' and is 'down upon them' on every occasion. He knows too much of the 'when,' 'where,' and 'how' of their irregularities and misdeeds, and is generally an advocate for punishment in a severe form, for 'cure' without 'prevention.'

In some cases, the 'mouthpiece,' the adjutant, takes it upon himself to perform without the 'instrument,' the colonel, and the result is not so much out of tune as might be supposed. Indeed, I have heard it said that the only officers required in an army are a general, an adjutant, and an assistant-surgeon! The individual who made this remark belonged to the last-mentioned grade, and was an Irishman, which accounts perhaps for his ignoring the question of whom the *assistant*-surgeon is to assist if there is no surgeon! Yet it is perhaps a little dangerous, in these days of economy, to thus make public the opinions of my Hibernian friend, lest the experiment may be tried of reducing our national military expenditure after his receipt.

The duties of an adjutant are very similar in whatever part of Her Majesty's dominions he may happen to be quartered; not on active service, of course, for that is quite another matter, but at home, in the Mediterranean, and the colonies, the work is very much the same. In India, it is rather different, as there he has dealings with the natives, and is sometimes also interpreter to the regiment. The heat of the climate, too, makes it necessary to have parades at odd hours; but in other respects the 'mouthpiece' preserves his accustomed place.

To begin, then, with an adjutant's life in barracks in a country town at home. If he is worth his salt (and we flatter ourselves that, generally speaking, we are up to our saline value), he rises at 6 A.M., the hour when the morning is made hideous by the bray of the bugles sounding the 'dress' for the early parade. This same dress is a warning bugle, which goes half an hour before each parade. It is of all bugle-sounds the most lugubrious and discordant, and its drawling, melancholy tones provoke every dog in barracks to howl in concert. The first parade of the day is at 6.30 A.M., and lasts for an hour. It is an uninteresting affair, under the superintendence of the adjutant and sergeant-major, no other officer being present at that early hour, except one or two young ensigns who are learning their drill. The men are generally without arms, and are told off into squads for 'extension motions.' The impression of an uninitiated observer, on seeing a squad put through the extension motions, would be that a number of men stand in a row, simultaneously contorting their bodies in every conceivable manner, whilst another man, with stripes on his arm and a short stick in his hand, struts about in front, *barking* at them.

After the early parade, our adjutant receives his budget of letters, which is generally of considerable size. They are of all sorts and sizes, from the largest official to the smallest 'billet-doux.' There are letters from men (gentlemen very often) desirous to enlist, but requiring that immediate

Digitized by Google

promotion may be guaranteed to them; letters from fathers wishing to purchase their sons' discharge; from mothers and friends, inquiring after the welfare of men in the regiment, and why they never wrote (as if I could tell!); and sometimes of men who have left the regiment, or died, or been killed in action years and years ago, and would have been altogether forgotten by us, but for the record kept in the orderly-room of what has become of them. There are advertising circulars, too, without number, principally from money-lenders; also from quack-doctors, from wine-merchants, tailors, and tradesmen of all sorts. These, together with the usual letters which fall to the lot of ordinary mortals, occupy our adjutant's time pretty fully until he repairs to the mess for breakfast at half-past eight. Here he meets the quarter-master and 'orderly subaltern for the day,' who have been superintending the issue of rations; the subaltern looking sleepy, and his appetite evidently not rendered very keen by the quantity of raw meat he has been called upon officially to inspect. At half-past nine, the bugle sounds for guard mounting parade. The men for duty fall in at 'open order' for the inspection of the adjutant, who goes round the ranks, and sees that each man is shaved, his hair properly cut, and his uniform and accoutrements scrupulously clean. He then goes round a second time, and looks at the pouches and ammunition; then a third time, and inspects the rifles; the men all this while standing 'at attention,' stock still, and scarcely daring so much as to wink without obtaining permission to fall out of the ranks and do so. To *sneeze* would be a serious breach of discipline! After the inspection, and all being found satisfactory, the guards are marched off to their posts. At ten o'clock, the doleful 'dress' is again heard, with the canine accompaniment; and at half-past ten is the regular morning parade. There is more 'pomp and circumstance' about this than there was at the early morning arrangement. The band plays; the men turn out in 'marching order,' and all the officers in full dress. The colonel himself takes command, and does the 'barking,' varied by an occasional growl, or a roar, if the manœuvres are not performed to his satisfaction.

After parade at half-past eleven, we all repair to the orderly-room, where the prisoners are 'told off' by the commanding officer. I fancy our proceedings here are very similar to those of an ordinary London police-court. A man is brought in, escorted by a sentry, and charged with having been 'drunk,' or 'absent without leave,' or what not. The evidence is taken; and the captain of the man's company produces the 'defaulters' book,' which shews how often, and in what manner, the culprit has previously committed himself; and he is punished accordingly. If he denies the charge, or if the offence is serious, he is remanded for a court-martial, by which he is tried. This is all very sad, and one sighs and wishes the world were better. But it is not so very bad after all, and the little military world is not so much the worst part of it as is generally thought. Soldiers are not murderers and butchers *con amore;* on the contrary, they are, I think, kinder-hearted than any other men of the same station of life, except perhaps sailors. They are peculiarly fond of children, and of taming and making pets of dumb animals. There are many Corporal (and even Private) Trims now-a-days, although they are differently dressed and better paid and cared for.

After the disposal of prisoners is ended, the colonel and the adjutant are left alone with their correspondence, and the latter drops into the post of private secretary. The colonel shews the adjutant the official letters he has received that morning, and *vice versâ*. Documents are signed, and letters written in answer to those received; drafts of others made, and of the 'orders' for the following day. This (with a short interval for luncheon) occupies our hard-worked functionary until half-past two, when there is another parade—more drill, more barking, growling, and roaring, until half-past three. He then returns to the orderly-room, and signs the orders for next day. These consist of the detail of officers and men for duty, of notices of awards of imprisonment and stoppage of pay, as also the names of men who have become entitled to good-conduct pay, &c., with directions for the parades and drills on the ensuing day, and many other things, which to describe here would be tedious.

After he has signed the orders, the adjutant's work for the day is virtually ended, except when there is an unusual amount of correspondence, when he is often at work for the whole afternoon and evening (with an interval for dinner at mess) until late at night. Moreover, he is supposed to be continually 'in the way,' in case of anything unusual occurring, and to be ready at all times to receive and answer letters, and see people, at odd hours and on odd subjects, who do not think it worth while to 'bother the colonel!'

It may be remarked that the adjutant works pretty hard for his money, in which opinion I entirely concur with the discriminating reader. If, however, it be supposed that I have written this paper for the purpose of indulging in an Englishman's privilege of grumbling, never was a greater mistake made. It was written solely from the suggestion of a friend (who ought to know something about such things), that it might possibly amuse and interest ordinary readers to peruse an account of the duties of an adjutant.

KITTY.

IN THREE CHAPTERS.—CHAPTER III.

THERE came the day for the picnic to Ashbury Hall. It was fine and sunny, and laden with the beautiful scent of flowers; and, inasmuch as Kitty Courtney knew it would bring her to Abel Musgrave, she thought all things were fine and sunny, and laden with beautiful flower-scent too.

With a certain utterance echoing in her ears, with its unhindered music making her raise her hands joyously to hide her impatient and longing eyes, it was just the shelter that it should be, to stray into Ashbury woods out of the blaze of the hot July sun. Kitty had been in the park now perhaps two hours. She and Mrs Courtney, and some half-dozen other ladies, had arrived as pioneers, to attend to the unpacking of the hampers; and now that this was seen to, and it was time for the company to come, Kitty had left My Lady's Oak-tree, that was the rendezvous, and had strayed away. She sat where she could see the guests as they drove in, and where she would stay till

Digitized by Google

she saw Abie Musgrave. He was her whole entertainment. Why was she there, if it were not that she might be with him! And had he come? Not yet; and Kitty still sat on. The lime-tree avenue was merry with dog-cart, and wagonnette, and phaeton, as they rolled briskly in; but not one of them held Abie. And then horsemen came; alone, or in clusters of two or three; and through the massy foliage she could recognise them all, and not one was Abie. But she sat on—getting weary of vain looking, sick from deferred hope; tearing up fern-leaves she had gathered, strewing the petals of the dog-roses into a little heap at her feet. More gentlemen were riding quickly down the avenue; but no Abie. The hotel 'sociable' was as crowded as it would bear; but it did not bring Abie. And now Kitty must go away. The company must be all come; it must be time for tea; and she must leave the bowering hazel-trees with this weeping heart within her, and go away. But, there was one chance left: Abie might have gone the other road! There was a bridle-path leading through the spinny, and if he had had *Old Sol* lent him, he was sure to have chosen that! How absurd not to have thought of that before; how ridiculous to have forgotten it, and to have sat hankering there!

Out from the little wood, then, Kitty walked; across the avenue, by the syringa-beds; over the soft dry turf, up to My Lady's Oak. Happy faces gave greeting everywhere—merry tongues; but still no Abie Musgrave. Smart young men, smarter still by roses or heather-blossom set about their hats, were carrying cakes, and creams, and custards, and placing them round the knoll; smarter girls, who would not have had their hats disturbed for all the wild-flowers in the world, were hurrying after these, for glad mischief, undoing their work directly it was done; children, as heedless and noisy as they should be, careered about amongst crockery and baskets, getting inextricably involved with dishes of fowl and ham; and burly fathers and contented married men were overlooking all with a broad warm smile, that meant they felt their being there a little condescending, but that there might be somewhat of satisfaction in the doings after all. Here, also, were the Folletts, and every tribe and variety of the Folletts, amidst such piles of damson-cheese, and ratafias, and candied-covered buns, it seemed the simple spreading of them would take an hour more; and here, too, was handsome and active Mrs Courtney, with a word for Kitty directly she saw her come.

'Catherine,' the word ran—and Mrs Courtney spoke from a cluster of restless-minded matrons anxious for the quality of the tea—'you can fill these sugar-basins with sugar, and send some one for more boiling-water from the lodge; and get the spoons out from the little Tunbridge basket; and go round and call all the people who have come.'

So Kitty did as she was bid; and then went on her little mission from busy group to group. To the lake's edge, where young folks sat upon the grass, and chatted; to the little brook, where the willows grew so thickly, she had to go right down to a pretty arbour to see if any one were in it; to the crisp-turfed terraces, where children were having eager and heated runs; to the path in the shadow of the great Hall windows; to the laurel thicket; to the head of the little beech-grove. And people trooped to the rendezvous at her call, leaving all their loitering-places in one gaily coloured stream; but she saw no Abie—she came to no Abie Musgrave! Surely, Kitty thought, she must chance upon him now! He would be in the shelter of this plane-tree, on the seat behind this weeping-ash.—No. Kitty went further still, with her heart growing so vexed and fretted, her usual cheerfulness was getting changed to tears; but she could find no Abie. Not in the peach-walk; not by the marble sun-dial; not riding—late now as it was—along the avenue; not by the flower-beds stretched before the house. She must go back, then, to My Lady's Oak. She had emptied the pleasure-garden thoroughly. There was no one else to be seen, why linger any longer now?

Back, therefore, Kitty went; so out of heart, she could have flown away; so out of heart, that if any one had spoken to her, she would have liked to have laid her hands about their face. Back across the avenue; by the odour-laden syringa-beds (how languidly they smelt! how even these nearly made Kitty faint and cry!); over the soft dry turf, up to My Lady's Oak.

Kitty's steps went faster. Musgrave *must* be there now; she *must* soon meet him, and see the love so strongly moving her lighting on his face! Surely he would not have staid away! Surely, after that talk with her in the minster porch, he would not have missed this chance of being at her side! He *must* be seeking her as eagerly as she was seeking him!

No; there was no Abie: not with those with their filled plates already on their knees; not with those who had just thrown themselves upon the grass; not with those who were yet laughingly straggling in. He had not come; he had not meant to come. It had never been his thought to come; and he had no care whether she were here or not. And overborne by this conviction, Kitty seated herself away from all the babbling idlers who seemed to have all they could desire, and amidst the unloveliness of empty baskets and strewn cloths, sat disconsolate and alone.

Mrs Courtney discovered her the instant there was a little lull. 'Catherine,' she cried out, 'what are you doing there? Come here, child, for some of Sophia's nice hot tea!'

'No, thank you, mamma,' Kitty said. 'Send me some, and I shall be very glad; but I am tired, too tired to come.'

A couple of the beaux, with flower-garlands on their hats, sprang to her side directly her mother spoke, and held out each a hand to help her to her feet.

'Go back!' she cried petulantly to these. 'When

Digitized by Google

I am hot and tired, I am like the babies, I grow very cross and peevish; and if any one comes near me, I will stone them off!'

She must come, they said. She must allow them to take her to Jinny Follett, who had the most ravishing Venice-cake and raspberries anybody had ever seen. She must consent. One, two, three, and the remove would be done.

'I cannot!' Kitty cried out again. 'I would rather stay here! Let me have my way!'

'Nonsense!' rung out Mrs Courtney, aiding the young men with her authoritative tongue. 'You have my permission to bring her of your will, if she won't come of her own!'

'You are great bears,' Kitty tossed out, as she was obliged to yield. 'You are jailers! You are spies! I will be as mischievous as possible! I will worry you all I can!'

And Kitty sat and played at pouting, to cover her chagrin; and she leaned upon the grass and pulled it, and picked the daisies into shreds.

Ah me! there was no word mentioned of Abie Musgrave. Kitty listened hard for that. She would have recovered some liking for the company, if they had shewn a little care: she could have melted into her ordinary *badinage*, if, by some stray chance, they had satisfied her mind; but they seemed to forget there was an Abel Musgrave; and she sat and began to hate herself and everybody, and to feel she could not keep down the aching at her heart.

The tea went on—with much running up and down the little knoll, much upsetting of plates and spoons; the girls were over-brimming with their friskiness, the boys quite as frisky as the girls. Kitty's silence was taken by them for caprice and waywardness, and made to do duty so for plenty of merriment more. Biscuit-pellets were fired at her, and sugar-shell. She was teased with offers of every dish, and worried into play; she was forced to hurl counter-missiles, compelled to take up the position of a besieged castle, and beat her assailants back: with her heart yearning—with the only thing she would have done—the only word she would have spoken, being to watch and ask for Abel Musgrave.—What had kept him? Had he sent word he couldn't come?—she was obliged to fence and parry, to snap out a threat or a repartee; and it was only when some newer target offered that her tormentors left her finally in peace; and then she held her head down, that no one might see her face, and she fretted miserably at the crushing end that had come to her hopeful day.

There came a stir. With her head still turned away, with her heart still full, Kitty was conscious of a slight commotion near her, and a sudden stoppage to the rattle of the spoons. A half-dozen young men bustled to their feet, and waved their hats and handkerchiefs in the air. There was a gig being driven along the avenue; and as it came quickly, and drew nearer, Kitty, even with her lowered head, saw the driver was Stephen Biddulph, the cheery widower, whom she had never missed, bringing with him the Abie Musgrave she had missed so painfully, she had thought that in another moment she must have cried!

She would not raise her happy eyes then; she must hide the cheeks that had such an exulting flush upon them, or they would tell her tale at once: so she plucked at the grass still, crushing the daisies and clover-heads into little fairy balls, throwing them down the knoll ceaselessly, to occupy her nervous hands. She dared not speak; the sudden triumph after her deadening pain had brought such ecstasy, she longed only to leave the busy feasters, and enjoy her gladness out alone. And there was no need for her to step into the front. Musgrave had a multitude of hands extended to him, to assist him from the gig, to welcome him when he was seated on the ground; so she kept her head down while she took her tea; she made all the haste she could; and then stole down to the willows overhanging the little brook.

There was a wooden bridge spanning the tiny thread of water, and Kitty crossed it and walked into the shrubbery beyond. She was crowned now; she had begun her reign; she had only now to stretch out her hand and grasp the jewels she had been longing for, and her exultation would be complete. She did not bound and hurry when she had consciousness of this; she only trod on triumphantly, feeding on her happiness, anticipating the quick coming harvest of her joy; and when she had lifted up her face to feel the cool air, she turned back to join the party, that she might realise her dream.

She could see My Lady's Oak when she made her turn; she could not see Abie though, and she was wondering who had helped him to move far away, when, looking down, she saw him, only a few steps from her, sitting at the foot of the wooden bridge.

He had not heard her come. She had time to note his attitude, his aspect—the willows over him—the wild-flowers to the very brink of the brook, before he raised his eyes, and knew that she was there. Then Kitty would have had him fly to her—she would have flown to him—she would have had him take her to him unasked and undisputed without a wavering word; but though there was pleasure in the face that swiftly recognised her, it seemed to Kitty she saw nothing more, and she was chilled to her heart's core, and her ecstasy died right away.

'I did not hope any one would be coming here,' said Musgrave, looking up at her as she leaned on the wooden rail.

'It was the quiet—it was that that brought me;' and Kitty spoke with a great deep pang. She shut her eyes, too, painfully, and sighed, and would have passed by.

'Nay,' Abie cried to her; 'stay, now you are here. Because I didn't hope for you, that is no reason not to be glad.'

'But I came for quiet,' fretted Kitty, unable to bear the agony of her wound; 'and I can have no quiet if I stay.'

'Must I *come* for you?' asked Musgrave, signing to a seat at his side. 'Will you not sit here without being made?'

No; Kitty dared not. It was too cruel to her, this communion with Abie, and then the communion ending where it had begun. She shook her head. But—this outer darkness was so killing, that lost light so sweet! and she was *but* a woman—and—and—she would!

Womanlike, though, she would be asked again. 'I will stay here,' she said. 'I will not go away, but I will stay where I am.'

'No,' urged Abie. 'Talk loses by the distance between us now, and you know I cannot easily get to you! Pray, come!'

'But why?' was Kitty's luring. 'I don't like to move unless I know why.'

Digitized by Google

'I will not tell you till you are here,' said Musgrave, his tones almost drawing her to his side. 'Then, if you will listen, you shall hear. Come!'

So Kitty stole down—round the overhanging willows, down the moss-grown bank; with steps that lengthened out the distance (she did not know why), and with a sadly treacherous heart; and then she knelt upon the grass by Abie, seated herself, and he took her hand.

'I had no greeting when I came,' he said, 'and so I may have it now.'

'You—you came very late,' broke out Kitty.

'Well,' was Abie's answer, 'to tell you the truth, I did not think to get here at all.'

This was not the speech to make Kitty's lip keep still. 'Perhaps you did not *care!*' she said; her cheek very pale.

'Why, for that,' said Musgrave, not looking at the face melting so cruelly at his side, 'what is Ashbury Hall, or anywhere, to *me?*'

'You might'—cried Kitty, so near an outbreak now she was on the very verge—'you might have liked—have liked to—to meet your friends!'

'Friends!' echoed Musgrave, looking round at the Hall, the groves, the avenues, with a broad sweeping eye. 'What is it that friends can do for *me?*'

Kitty's tears broke into a full sharp shower. Spite of her striving, spite of the strong curb, they fell in a hard hot burst, and she started up to fly away.

'Kitty, Kitty!' Abie cried, catching at her skirt.

She would not stay. She had been so full of love to this man, the agony of her swift overthrow was more than she could bear. Over the bridge she meant to go, out into the little thicket, where the same trees that had witnessed the confession of her joy should look on whilst it was laid low; but she gave one glance at the brook-side where death had come to her, and she saw Abie raising himself, with a speed perilous to his enfeebled limb, that he might get to her and pluck her back.

'Kitty, Kitty!' rang his cry again; and his arms were out that she might come.

And the trees looked down upon a different hasting, and the willows fluttered with another cry. Kitty turned—back upon the smooth bank, down upon the short crisp grass; and Abie snatched her, and drew her closely to his breast.

'Little girl!' he cried—'little girl! has it come to this?'

No answer for him; nothing but the dear head close upon his breast.

'Why, little girl!' was his cry again. 'My Kitty! Isn't this little girl's faith as strong as mine?'

Kitty found faint voice through her tears then. 'I have no faith at all,' she sobbed; 'I am very foolish; very weak.'

'Why, Kit,' cried Abie, kissing the lips that had spoken to him, and the eyes that again sank low, 'have I been cruel? Ought I not to have relied on you being strong?'

'You are the best,' sobbed Kitty. 'It is only I who am not good; it is my weak fault. Forgive me, and let me go.'

'Go!' cried Abie, holding her more tight. 'Now I have once had you, you shall never go away! No, little Kitty! *My* little Kitty! You must stay now!'

'But you never would!' said Kitty, through her sobs—'you never would, if I had not been so weak! You will mock at me by-and-by!'

'Why, Kit, listen!' cried Abie. 'I never should have held back without a word, if I had not loved you as I do! I meant to have worked hard—the hardest; to have denied myself everything; to have had no expense I could have done without; so that in three years, perhaps, I should have worked myself back to what I was before; and then, my Kitty, love, I should have come to you, the crown of all my labouring, and told you what I tell you now. Are you clear, my Kitty, about that?'

'Yes.' And Kitty let the kisses fall upon her lips, and did not take her held hand away.

'I did not speak,' Abie went on, 'because I would not have any one looking shy upon you. Do you understand?'

'Yes,' was again Kitty's one word of answer; but this time the sobs began to die away.

'I might have lost you so, I know,' said Abie: 'that was my only fear. But I was *almost* sure, Kitty; and if I *had* been mistaken, it would only have proved that it was better I had never told! It would have shewn you didn't care, Kitty. Do you see it all now?'

There came from Kitty just the anticipation of a smile. 'But if you didn't tell me,' she asked, 'if you never spoke, how was I to know?'

The kisses fell swiftly and frequently at this. 'You *should* have known,' cried Abie, 'that I *couldn't* see you without thinking you the dearest little Kitty in the world! and if you loved me, you should have been certain that I loved you!'

'I wish,' cried Kitty, with the sparkle of her usual self—'I wish, to tease you, I dared deny now that I do!'

Abie's response to which was impeded much by kisses; but it went, as Kitty's quick ears understood it: 'You merry Kit! How could I know such a great deep waterfall was under a face like this!'

And at night, when the sun had turned from gold to gray, and the moon had crept up silently to her work, Kitty left the old woods and park of Ashbury to get back with her mother to the Combe, and a pretty confidence she had to mingle with her affection and her chat. She had to tell of Abie; of what he had said to her; of the time it would take to work himself free. He and she had thought to be just as they were, she said; to have no engagement beyond an understanding that they were tied together by a great strong love. And then, when Abie was what he hoped to be, he would come to the Combe to say what he had to say, and then—and then—why, Kitty would like to know what papa and mamma would answer in return!

Mr Courtney put his hands out with only feeble comprehension of what she told. 'You are my own little girl, Kitty!' was his plea. 'You mustn't leave your poor old father! You mustn't go away!'

But Mrs Courtney's comment was pitched to a very different tone. 'Gracious, Catherine!' she cried, 'is that why you staid so long at Abel Musgrave's side? I saw you sitting there; but I never thought it would have come to this. Why, child, the man is only just recovering from ruin; and to think of *you!*'

Nevertheless, when the three years were over, there was no 'No.' Good luck came to aid Musgrave's good endeavour; and when people saw to

Digitized by Google

what an establishment he had returned, they began to hint that Mrs Courtney had managed very well, and that perhaps Kitty couldn't have done better, even had she tried!

THE MONTH:

SCIENCE AND ARTS.

CHEMISTRY has been described as a science in which, if a man will but stoop, he cannot fail to pick up things worth finding; and that this is the fact is demonstrated by the unbroken series of discoveries made in all countries where science is cultivated. Not startling discoveries, perhaps, furnishing occasion for popular excitement, but unobtrusive results of hard work and intelligent investigation. Chemists enjoy the great advantage of a field of research which is inexhaustible. The more they learn, the more remains to be learned; and it is safe to predict that, wonderful as have been the discoveries made by chemists within the past twenty-five years, those to be made within the next half-century will be at least equally so.

Dr Frankland has been for some years experimenting on certain phenomena of combustion, and finds as a general law that the illuminating power of a flame is in proportion to atmospheric *pressure*. For instance, a lamp gives less light at the top of a mountain than at the bottom, because of the diminished pressure of the air at high elevations. And he finds reason to doubt the generally received theory that the light of luminous flames is due to the presence of solid particles —that is, of carbon. There are some very luminous flames in which, it is known, there cannot be any solid particles whatever; hence Dr Frankland concludes that the luminosity of gas and candle flames is an effect of radiation from dense but transparent hydrocarbon vapours. In one series of experiments, the burning of a mixture of hydrogen and carbonic oxide in oxygen was carried on under different pressures, up to a pressure of twenty atmospheres. The increase of brightness in accordance with increase of pressure was most remarkable; and it may be expected that these results, though of a high philosophical character, will in due time be turned to practical account.

A Frenchman, M. Le Roux, has discovered a way by which the brightness of the electric light may be largely augmented. He places a bar of magnesia, specially prepared, close behind the arc of light formed between the two charcoal points, and the light is thereby so well concentrated and reflected, that the illuminating power is increased in a surprising degree. But there is a difficulty in the way of bringing the light thus improved into general use: it is that the bar of magnesia by exposure to the intense action of the light becomes converted into a kind of glass, and loses its effect. If this difficulty could be overcome, M. Le Roux' electric light would be as much used as admired.

A paper, *On the Transmission of Power by Water-pressure*, has been read before the Institution of Mechanical Engineers, by Sir William Armstrong, in which it was explained that with a good head of water in an elevated tank, or in an accumulator, power may be transmitted to a distance, as it is by iron shafting. But for many purposes water in a pipe is preferable to shafting, inasmuch as it is perfectly controllable, and being uniform in its action, communicates no shocks to the machinery. At present there are about six thousand hydraulic machines in use, mostly in this country, and it is in docks and other establishments where there is much lifting, and loading and unloading to be done, that their use may best be seen. Twenty or more cranes may be working at once unaffected by each other. At the docks at Goole, on the Humber, these hydraulic cranes lift barges containing thirty-two tons of coal fairly out of the water, to a considerable height, where they are made to tip their load all at once into a coal-ship lying alongside. Another use for hydraulic machinery is to feed blast-furnaces. These furnaces are now built so big and tall, that the labour of wheeling up the ore and fuel to the mouth would be too severe and costly. The hydraulic lift, when properly arranged, does it by the turning of a cock. By the same simple operation, large holes can be punched through thick solid iron. At Newcastle-on-Tyne, the water-supply, as it runs down one of the hilly streets, flows through an engine, and prints a newspaper. In other parts of the same county, all the raising and lowering in mines is done by water-power. The 'lifts' in hotels and warehouses also rise and descend at the turning of a tap; and we have listened to the music of a magnificent organ, of which the bellows was blown by water-power. The water is ready for work at any moment, and makes no noise either when turned on or turned off. From this, it will be understood, that for many purposes water is preferable to steam.

In the United States, a considerable number of small machines from one to four horse-power, worked by heated air, are in use. They are the invention of a Swede by birth, Mr Ericsson, who is now endeavouring to find a way by which the direct heat of the sun may be used to set machinery in motion, without the use of coal or other fuel. He has satisfied himself that it can be done; and he estimates the heat falling, directly, on ten square feet of the earth's surface as more than equal to one horse-power; and the heat wasted on the roofs of Philadelphia would work five thousand steam-engines, each of twenty horse-power. This seems marvellous; but Mr Ericsson reckons that the heat radiated from ten square feet of the sun's surface would be sufficient 'to run an engine of 45,984 horse-power.' The inventor is very earnest in endeavours to reduce his theories to practice. Should he succeed, there will be an end to the melancholy forebodings which some people have entertained as regards the speedy consumption of all our coal. When the sun works our engines, manufacturers will have nothing to dread but cloudy weather.

Some readers will remember that in the observations of the total eclipse of the sun last summer, the red protuberances were among the principal objects of interest. Up to that time it had been thought that those remarkable objects could be seen only during an eclipse; but scarcely was it over when M. Janssen in India, and Mr Lockyer in this country, discovered that with a spectroscope of special construction they could be seen whenever the sun was shining. And now Mr Huggins, in a note to the Royal Society, makes known that he too has seen the red prominences in ordinary daylight, and that he has a method of examining them which gives better results than any hitherto

Digitized by Google

obtained. The consequence is, that observations of these phenomena will become so numerous, that our knowledge of the circumsolar regions will be largely increased: and, as physicists know, there are many reasons why we ought to know more about the sun than we do at present. In addition to this, we notice that Mr Huggins has contrived a process by which he measures the amount of heat radiated to the earth from some of the principal stars.

Mr Ellery, government astronomer at Melbourne, has calculated the rate at which the great tidal wave occasioned by the earthquakes in Peru crossed the Pacific. The distance between South America and Australia is six thousand five hundred statute miles; the wave travelled across in thirty-two hours, being a rate of about two hundred miles an hour. What an idea this fact conveys of the tremendous force of the original shock!

Are we about to have a supply of home-grown sugar? It seems so; for Mr Duncan, an enterprising merchant of Mincing Lane, has laid out works and built a factory near the pleasant town of Lavenham, in Suffolk, for the manufacture of beet-root sugar. Sugar-growing is a profitable occupation in Belgium and the north of France; and it remains to be seen whether it can be made permanently profitable in this country. The farmers of Suffolk supplied Mr Duncan last year with 800 tons of Silesian beet; and this year they hope to increase the quantity to 4000 tons, for which the payment is to be one pound a ton. The 'works,' when in full operation, use up sixty tons of beet a day, during the sugar-making season, which commences at the end of September.

This is an experiment in which the whole nation may be said to be interested, for the annual consumption of sugar in the United Kingdom is nearly forty pounds a head, reckoning the entire population. If successful in Suffolk, it may be expected to answer in other counties, for seeds have been sown elsewhere, by way of experiment; and it appears that the roots grown in England and Scotland contain more sugar than those grown in Holland. There is much more sugar made in Europe (all from beet-root) than would commonly be imagined, the quantity being 630,000 tons, as shewn by the returns for the season 1867–68. The season begins October 1, and ends April 1. Of this great quantity, France manufactured 220,000 tons; Germany, 165,000; Russia, 97,500; Austria, 92,500; and Belgium, Poland, Sweden, and Holland, 55,000 tons. We observe, moreover, that endeavours are being made to introduce the manufacture into the United States, where the beet is unusually rich in sugar, and where the cost of imported sugar is eighty million dollars a year.

THE FOUR MOURNERS.

The bravest of them all lay slain;
The trumpet's blast appealed in vain
To ears that never should hear again.

Within the tent upon the floor,
There crouched three women weeping sore,
And one sat silent by the door.

First spake the eldest: 'O my son!
My course on earth was nearly run,
Couldst thou not stay till it was done?

'Then would I wait thee on the strand,
Once more to take thee by the hand,
A child again in that new land.

'And now Heaven's sun shines first on thee,
Alas! thou wilt not think of me,
How my last days will darkened be!'

Then spake the sister: 'Thou saidst true,
O mother dear! Thy days are few;
Short space is left for thee to rue.

'One brother had I—only one;
How will it be when thou art gone,
And I left here alone—alone!

'O for those happy hours again,
When he and I were children twain,
Sharing each little joy and pain!

'Together in the woods we played,
Beneath the checkered sun and shade,
And of wild berries garlands made.

'Together climbed the elm-tree tall,
And watched the shadows rise and fall,
And measured heights against the wall.

'Each trifling memory seems to start
To life again, and form a part
Of the great wound that wrings my heart.'

Then wailed the youngest of the three:
'Oh, little seems your grief to me,
Whose thoughts and memories wander free!

'My cloud is all too black and vast,
To see behind it, or forecast—
I have no future, and no past!

'My lord, my love, my life lies here!
No care have I—no joy, no fear—
Save the dead form upon this bier!'

And still the other sat silent by—
Her lips were mute, her eyes were dry;
No mortal heard her woeful cry:

'O God! more bitter and more deep
The gnawing pain, I secret keep,
Who have no right to moan or weep!

'My grief is silent—my love was vain;
Yet weary years shall wax and wane,
Smiles sit on others' brows again—

'His name be blazoned in the past,
Ere my heart slumbers—holding fast
Its hidden burden to the last!'

ABOARD THE SEA-MEW.

IN TWENTY-TWO CHAPTERS.

CHAPTER I.

I SHIPPED aboard the *Sea-mew*, full-rigged, trading from the port of London to New Zealand. Two more old shipmates of mine entered along with me; and we were just beginning to feel the breeze that would send us down Channel in less than no time. The skipper came aboard at Gravesend, and the rest of the passengers, and among 'em we had one poor chap who had to be whipped up in a chair, looking the while like as if he'd come aboard to find a hammock and a sailor's funeral. There was some petticoats, too, about him, and they had to be whipped up too, but I didn't take much notice, being hurried about here and ordered there, and the passengers all seeming to have an idea, that now they'd come aboard, all there was to do was to get in everybody's way, and stand wiping their eyes. They would get in your way and aggravate, and when they moved, go and stand somewhere wuss, till it was enough to make a saint swear; and I'm blest if I don't think that, being a man used to the sea, and a quick-tempered sort of a fellow, Peter hisself would have gone on 'most as bad as I did. What does a great fat fellow of two-and-forty want to go walloping down where the mate had told you to coil forty fathom o' rope, and then begin blubbering like a great gal? And what do people as have done nothing but grumble and cuss at the old country, go waving their handkerchiefs at it for, and then fall into one another's arms a-kissing and a-hugging, and just, too, when the deck 's in such a litter that the skipper and the mate are 'most raving mad?

It's a nice place, deck of a ship just before sailing; what with the lumber, and the crew being all raw, and half of 'em three parts, or quite drunk. We'd a nice lot, we had, aboard the *Sea-mew; for it* seemed to me, as soon as I saw them together, that the skipper had been having the pick of the docks, and choosing all them as nobody else wouldn't take aboard a ship. But it was in this way: there'd been a sort of an upset about pay, and half the merchant-sailors were on strike; and as the owners of the *Sea-mew* had advertised her to sail at a certain time, and it was ten days past that time, the skipper had been obliged to sign articles with any one he could get. They were all fresh ones to us; six-and-twenty of 'em, but mostly seemed to know one another, and how to handle a rope.

We'd a mixed freight—live-stock mostly, going out emigrating, and more live-stock to feed 'em with, and a young doctor to see as they was all well, and had their salts and senny reg'lar; and a great big chap as couldn't stand up down below, but was always chipping his head, and taking the shape out of his hat against what he called the ceiling. They said he was a nat'ralist, though he was about the longest, okkardest, corner-shaped, unnat'ral fellow I ever did see; and he'd got more live-stock in no end of great cages—cock-sparrows and tom-tits, and blackbirds and starnels, and all sorts o' little twittering things to introduce amongst the New Zealanders. Then there was Brummagem and Manchester and Sheffield goods, and plants and seeds in cases; and the deck that full, that, as I said before, it was enough to make any one swear, let alone a sailor.

'Tain't a nice time, the first week at sea; for, to begin with, it takes all that time to get the long-shore goings on shook out of the men, and them fit to work well together; then, if it happens to blow a bit, as it mostly does in the Channel, there's all the passengers badly, cabin and steerage, and their heads chock-full of shipwrecks; and when they ain't frightened of going to the bottom, calling the doctor a brute for not attending to 'em. Sea-sickness is bad enough, while it lasts, but folks needn't be so disagreeable about it, and every one think his case ten hundred times worse than any-body else's; but they will do it; and as for the fat chap as cried so about going away, he quite upset the young doctor, as they called Mr Ward; and if I'd been him, and been bothered as he was, I'd have give Mr Fatsides such a dose o' Daffy as would have sent him to sleep for a week.

CHAPTER II.

'You 've put your foot in it, Sam Brown,' I says to my old shipmate when things was about knocked together, and we were bowling along well out of sight of land. We 'd been putting that and that together, and found out that for some months to come, let alone wind and weather, we 'd got our work cut out, the skipper being one of your reg'lar slave-drivers, that nothing can't satisfy, and the mate a sneak, as would do anything to please the captain. So 'You 've put your foot in it, Sam Brown,' I says; but he only grunted. Bill Smith, though—my other mate—turns a bit rusty, and says it was me as got them to sign the articles, and it was all my fault; for he was a bit sore, owing to a row he 'd been in that day.

But it was no use to growl, and say the ship was a bad one; we were in the ship, and bad captain, bad mate, bad crew, and bad victualling, there it all was, and there was no getting away from it.

'Never mind, lads; 'tain't bad pay,' I says.

'Pay!' says Bill Smith. 'I 'd forfeit to-morrow to be out of it, and—— Look ye there, Tom.'

I turned to look; and it was the passenger I 've spoken of before, him that was whipped up on deck, and now he was out for the first time for a walk, being a bright sunshiny time; while the petticoat as came on board with him was leading him about the deck.

'Looks bad,' I says.

'Yes,' says Bill. 'But I meant the lass. Just look at her.'

'What for?' I says.

'Fine lines,' growls Sam Brown, squinting at her, for he was a chap that could squint awful, and when he looked partic'lar at anything, his eyes used to get close together, and he had to turn his head first on one side and then on the other. He was such a quiet chap, and spoke so little, that I used to think his eyes tried to turn round and look inside his head, to see what he was thinking about. 'Fine lines,' he says, and then he shuts one eye up, and holds it close, while he has another look.

'Beautiful! ain't she?' says Bill.

'Gammon,' I says. 'Wax-doll. She 'd better not get wet, or she 'd melt. I wish they wouldn't have no women aboard.'

'Why?' says some one close behind me. And looking round, there was the young doctor and Tomtit, as we called him—the long chap as had all the birds.

'Why?' I says gruffly; 'because they 're in the way, and ain't no good, and consooms the ship's stores. Would my deck be littered here with hens and cocks singing out eight bells when 'tain't nothing of the kind; and a couple of cows as is always lowing to be milked, and then giving some thin blue stuff like scupper-washings; and a goat and ducks, till the place only wants an old turkey-cock and a jackass or two to be a reg'lar farmyard, 'stead of a ship's deck—would there be all these things aboard if it warn't for the women? Bother the women! I wish there wasn't a woman on the face of the blessed earth.'

'He was crossed in love when he was a young un, sir,' says Bill Smith with a grin.

'Women's right enough ashore,' says Sam Brown, and he squinted towards where the sick passenger was along with the petticoat, till both his eyes went out of sight behind his nose, which was rather thick in the bridge, and then he sighed, and went and sprinkled the sea with a little baccy-juice before coming back to the job we were at—scraping the chain-cable.

'One of our protectors wants to pay his respects to you, Miss Bell,' says Mr Ward, the young doctor, you know, for just then she was passing close by with the poor thin sick chap, who was her brother, and I saw her just bend her head as the doctor and Tomtit took off their hats to her.

'Sarvant, miss,' I says gruffly, getting on my legs too, for there was something about her as seemed to compel one to be civil like, being a tall bright-eyed girl, with red and white in her face, and a set o' teeth as couldn't ha' known what it was to want to be pulled out in their lives. 'Sarvant, miss,' I says, making a scrape, and not a bit took aback. 'I was only a-saying as wom—ladies ain't no business aboard ships.'

'And why not?' she said quietly.

''Cause all 's rough and ready, and folk's tongues gets running too free afore them,' I says. And then to myself: 'That 's one for you, Mr Jalap;' and then I turned towards the sick young man, whose sunken eyes looked brighter, and angry, and jealous like, as he held tight by his sister's arm, and he says: 'Come, Eady, let 's go below. The sailor is right.—Drink my health, my man;' and he threw me a shilling.

'That I will, sir,' I says, as he turned away, though I thought to myself it would want drinking a many times before I could do him any good.

The doctor looked rather black at me; but I wouldn't see it, and got down cross-legged at my work, while Tomtit and he lit their cigars, and began walking up and down the deck.

CHAPTER III.

What a wonderful deal a sailor can get to know if he only keeps his eyes and ears open! Of course, I mean aboard ship, where everything is, as you may say, close to your hand. Now, acting after this way, and being a rough, blunt sort of an old fellow—for I always looked old from the time I was forty—people would come and make friends with me, in a fashion, so that I got to know a deal. The doctor would have his chat on things in general, and give me cigars, and by degrees work round to the sick passenger and his case; and I soon could see that though he didn't care a dump about the sick passenger, he took a deal of interest in his case, and I could guess pretty well why. Then Tomtit would come and fold his back, so that he could lean his elbers on the bulwarks, and he 'd chatter about his birds, all the while smoothing his hair, and arranging his tie and collar, and brushing specks off his coat, as he kept looking towards the cabin-stairs, to see if some one was coming up; and when—being a thoroughly good-hearted, weak, soft Tommy sort of a chap—he 'd heave a great sigh, I used to shake my head at him, and say as I could see what was the matter with him, it was wonderful how friendly he 'd get.

'I wouldn't care if I had a few canaries on board,' he 'd say. 'They are such nice birds if you want to make a present to a lady.'

'Why not try a couple o' doves?' I says.

He looked at me as if he meant to do it through and through, but I don't think he got any further

Digitized by Google

than the outside rind—mine being rather a thick skin, and I didn't let a single wrinkle squeeze up to look like a smile; so he says, after a minute's thought: 'You're right, Roberts,' he says; and that night, hang me, if he didn't send me to the cabin with a note, and a cage with a couple of turtle-doves in. He gave me half-a-crown for taking it, and he'd been busy all the afternoon touching up the cage with a bit of ship's paint, that wasn't half dry when I took it; but I brought it back again with me, with Mr and Miss Bell's compliments and thanks, but Mr Bell's health would not bear the noise of the birds.

The poor chap — Butterwell, his name was— looked awfully down when he saw me come back, but he wouldn't shew it more than he could help; he only said something about wishing he'd had canaries, and turning his back to me, began to whistle, and feed his other birds, of which he'd got quite five hundred in a place fitted up on purpose, though there was nearly always one or two dead of a morning, specially if the night had been rough.

Well, somehow, I got to see that Miss Bell was not without her admirers; while her brother, poor chap, clinging to her as the only being he had to love on earth, seemed to hate for a soul to speak to her, and whenever I saw him, he used to watch her every look. Not that he had any need, for she seemed almost to worship him; leading him about; reading to him for hours, till I've heard her husky and hoarse, and have gone and fetched a glass of lime-juice and water from the steward, to get a pleasant smile from her, and a nod from the sick man for what I had done.

'You're a lucky man, Roberts,' Mr Ward says to me one day when he had seen me fetch it, and the pay I got for my trouble.

'What for?' I says gruffly, for it wasn't no business of his. 'P'raps you'd like to change places, sir, eh?' But he only laughed, and the more rough I was, the better friends we kept.

There were many more passengers, of course, but I never saw that they were any different to other cargoes of emigrants as I had helped to take over: there was two or three of those young chaps that always go out to make fortunes, packed off by their friends because they don't know what to do with them at home; some young farmers, and labourers, and mechanics—some with wife and children, some without; children there was plenty of—always is where there's women; and one way and another there was plenty to make the ship uncomfortable, without a skipper who was a brute, and a mate a cowardly sneak. The crew were as bad a lot as ever ran round a capstan, but that was no reason why they were to be treated like dogs. If they'd been as good men as ever stepped, it would have been the same, for Bill Smith and Sam were A1 foremast-men; and while there was a sheet to haul taut, a sail to furl, or a bit of deck to holy-stone, I was ready to take my turn; but it was all the same, and I've seen the men bullied till they've gone scowling down below, and more than once I've said to Sam: 'There'll be foul weather yet, my lad, afore we get this voyage to an end.'

CHAPTER IV.

Now, as to ordinary weather, that was all as a sailor could wish for—bright skies, fine starn winds, and the ship bowling along her nine or ten knots an hour. We got into the warm belts, shoved up the awnings, and had our bits of fishing as chances come up; but for all that, I wasn't easy in my mind. I'd been so long at sea, and knocked about amongst so many sorts of people, and in such different weather, that appearances that would not have been noticed by some folks made a bit of an impression on me, and not without reason, as you'll say by-and-by. For instance, it didn't look well, so I thought, for a chap to out knife and threaten the captain, for hitting him on the head with a speaking-trumpet, though it might be only in a bit of a passion, still it didn't seem right; nor yet for the skipper to be always harassing the men when there was no need—piping all hands up to make or shorten sail, when the watch could have done it very well themselves, and then making the men do it again and again, because it wasn't what he called smart enough. You see, men don't take much notice of that sort of thing once, nor yet twice, but if it's kept up, they grumble, 'specially when they know they've been doing their best. Then the provisions were horrible, and enough to make any man discontented; water wasn't served out in sufficient quantity, and things got so bad at last that the men had meetings right forward of a night about the way they were served.

I knew a good deal and heard a good deal, but it didn't seem to be my place to go and tell tales, and besides, I never thought there'd be much the matter, more than a row, and perhaps a man or two put in irons, to be kept there till we got into port. I said so, in fact, to my mates Bill and Sam, 'and what's more,' I says, 'irons won't do for me, my lads, so let's make the best of things, and get a better ship as soon as we can.' Sam grunts, and Bill Smith said it was all right; so we went on with what was set us to do, and made as little trouble of it as we could.

But there was one chap aboard as the captain seemed quite to hate, and used to put upon him shameful. He was a thin wiry fellow, as yellow as a guinea, and looked as if he'd black blood in his veins; but he always swore as he had not. He'd got a Dutch sort of name, Van Haigh, but hailed somewhere out of one of the West Indy Islands, and had knocked about almost everywhere. Curious-looking chap he was, looked as if he'd always got his parlour-blinds half pulled down, and he'd peep at you sideways from underneath them in a queer cat-like sort of way. He was quite a swell sort of fellow in his way, only dirty as dirty, and that didn't do nothing towards setting off the big silver rings he had in his ears, and was uncommon proud of. We always used to call him Van for short; and against this chap the skipper always seemed to have a spite, bullying him about more than all the rest put together, till you might have thought his life would have been miserable—but not it: he always shewed his white teeth and grinned, pocketing all both the skipper and the mate gave him, till them pockets of his must have been full and nigh unto bursting. Once the captain knocked him down with a marlinespike, but he never drew no knives, not even when the mate kicked him, and told him to get up. He only grinned, but it was a queer sort of grin, and I didn't like the look of it.

These sort of rows used generally to take place when the passengers had gone down of a night, or before they came on deck of a morning. While before the cabin lot, Captain Harness was quite the

Digitized by Google

gentleman, and it seemed to me that he had a sort of hankering after Miss Bell, like some more of them, or else he wouldn't have been so wonderfully civil about having Mr Bell's chair moved here and there, and wanting him to take wine, and things that Mr Ward said he was better without.

As to the fore-cabin passengers, they went on just about the same as fore-passengers mostly do: asked every day whether we were nearly there, played ship's billiards, and a bit or two of music; smoked a deal, and slept a deal more, and only did just so much work as they was obliged to. No doubt there was their little bits of squabbling, and courting, and so on going on; but my eyes were turned in another direction; and, soon after we 'd crossed the line, I couldn't help thinking how very sixy and seveny matters had growed. Instead of being friendly, there was quite an unpleasantness between Mr Ward and the Bells, for the sick man was as jealous as could be, and it was plain enough that he downright hated the doctor. As for Miss Bell, as far as I could see, she never even bowed to him, and he and Tomtit used to walk up and down the deck together, as if they were the fastest of friends. 'And why don't they bow to one another as they used?' I says to myself, as I lay in my hammock. 'Why don't you mind your own business and go to sleep?' says Common-sense; and as I was too tired to argufy, I made no answer, but went off sound.

CHAPTER V.

Now, if what I'm going to tell you had happened a week sooner, I should have been on the lookout for it, or, if it had come off a week later; but, like many more such things, it came when it wasn't expected, and my sails were took aback as much as anybody's.

Things had been going on more peaceably than usual—weather having been hot, with light steady wind, which just took us easily through the water with stunsails set alow and aloft. The heat had made the captain sleepy, and he shewed precious little on deck, while the mate, who always took his tone from the skipper, used just to give an order or two, and then make himself as comfortable as he could.

It was my watch one night with Sam Brown, Bill Smith, and a couple more. Hot! it was one of the hottest nights I ever knew, and we were lolling about over the sides, looking at the golden green water as it gently washed by the bows as we just parted it, making only way enough for the ship to answer her helm. Bill Smith had gone to take his trick at the wheel, and, looking along the deck, you could just make out his face by the binnacle-light shining up and around him. There was a faint glow, too, up from the cabin skylights, and from where the ship's lanterns flashed on the water, else it was a thick darkness everywhere, and us sailing through it, and seeming to get nearer and nearer to some great black heat, that made the perspiration stream out of you at every pore.

'Nuff to bake 'em down below, Sam,' I says, after we 'd been quiet for a good hour. 'I fancy if I was there, I should be for coming up and lying on the deck, where it 's cooler.'

'Cooler!' says one of them with us, 'why, the planks are hot yet.'

'But you can breathe,' I says.

'Well, yes,' says the other; 'you *can* get your breath.'

Then we were quite still again for a piece, when Sam gives me a shove, to call my attention to something.

'Well, what now?' I says.

'They 're a-coming on deck,' says Sam.

'They 're in the right of it,' I says; 'and if'—

I got no more out, for there was a hand clapped over my mouth, and the next moment I was at it in an up-and-down struggle with some one, but not so hard but that I heard Sam Brown go down like a bullock upon the deck; and then I shook myself free, ran to the mizzen-shrouds, and sprang up them like a cat; and, as soon as I was out of reach, leaned down and listened.

There was no mistake about it: the ship had been taken with hardly so much as a scuffle, and though I could not see more than a figure trot quickly by one of the skylights, I could hear that the hatches were being secured, and men posted there; and for a minute I felt sure that we had been boarded in the darkness, and that I, one of the principal men in the watch, had kept a bad look-out. Directly after, though, there came a bit more scuffling and an oath or two, and I heard a voice that I knew for Bill Smith's, and another that I could tell was Van's; and then, like a light, it all came upon me that while we had been watching out-board, there was an enemy in the ship, and the men had risen.

I wouldn't have it for a bit, feeling sure that I must have known of it; but I was obliged to give in, for I heard next in the darkness a hammering at the cabin doors, and the skipper's voice shouting to be let out; and then came the mate's, backing him up; then a pistol-shot or two, and the shivering of glass, like as if the cabin skylight had been broken; and then came Van's shrill voice, giving orders, and threatening; and from the way the man spoke, I knew in a minute that there had been a chained devil amongst us, and that he had broken loose.

As soon as I could pull myself together a bit, and get to think, I got out my box, opens it and my knife, cuts a fresh bit of baccy, and then taking a good hold of the stay I was on, began to wonder what I'd better do next. Staying where I was did very well for the present; but it would not be such a great while before daybreak, and then I knew they would see me, and, if I didn't come down, shoot me like a dog. I felt sure that they had done for my two poor mates, for I could not hear a sound of them; and seeing that joining the enemy below was out of the question, what I had to do was to get to them in the cabin. But how?

There I was, perched up close to the top, with the yard swinging gently to and fro; and between me and those I wanted to join, there was the enemy. I felt puzzled; and in the midst of my thought, listening the while as I was to the muttering of voices I heard below, I snapped to the lid of the steel box I had in my hand, and in the still night it sounded quite sharp and clear.

'What a fool!' I said to myself, and crept in closer to the mast, for the voices below ceased, and two pistol-bullets came whistling through the rigging. Then there was a sharp whispering, and a couple more shots were fired; but I did not move, for it would have been like directing them where to aim. Then came Van's voice, as he

Digitized by Google

shouted: 'Fetch him down!' And I knew from the way in which the rigging trembled that some of the enemy were coming up the shrouds to leeward and windward too.

'Hunt him overboard, if he won't give in,' shouted Van, and I set my teeth as I heard him; but there was no time to spare, and feeling about for a sheet, I got hold of it, meaning to swing myself out clear, and hang quite still, while they passed aloft, and then try for some hiding-place where I could gain the deck. I held on tight for a moment, and listened; and then in the darkness I could hear some one coming nearer and nearer, when, letting go with my feet, I swung gently off, and the next instant brushed up against something, when my heart gave a great bound, for I had found the way to get down to them in the cabin.

CHAPTER VI.

'It may come to a fight though, after all, and a prick will keep some of them at a distance,' I says to myself, and getting my legs well round the sheet, I got hold of my knife, and opened it with my teeth, before making use of the chance that had shewn itself.

Perhaps it isn't every one who knows what a wind-sail is, so I'll tell you: it's a contrivance like a great canvas stocking, six or seven feet round, and twenty or thirty long; and by letting one end of this hang down through the cabin hatch or skylight, and having the other bowsed up in the rigging, you have like a great open pipe bringing you down a reg'lar stream of cool air in the hot weather.

Now it was just against the top end of this that I had brushed; and as it seemed to me all I had to do was to slip in, check myself all I could, and then go down with a run amongst friends, where, if not safe, I should certainly share their fate, whatever it might be, besides, perhaps, being of some use.

Fortunately, I had the rope, and hauling myself up a bit, after two or three tries, I got my legs in, lowered away quickly, and came down pretty smartly, not, as I meant, in the chief-cabin, but upon the deck, where I was now struggling to get loose, like a monkey in a biscuit-bag, for they had done what I had not reckoned upon, dragged up the end of the wind-sail, and shut down the cabin skylight, most likely when I heard the shots and breaking glass.

It was lucky for me that it was dark, for though the noise I made brought them round me, I had time first to slit the canvas and slip out, panting, and not knowing which way to turn. I knew they dare not fire, for fear of hitting one another, and starting off, I ran them once right round the deck, keeping as much as I could under the bulwarks. The second time round I came right against one fellow, and sent him down head over heels; but I knew it couldn't last, and that in spite of doubling they must have me. I could hear panting and voices all round, and on leaving off running, and creeping cautiously about, more than once I felt some one pass close by me—regularly felt them, they were so close. Once I thought of getting into the chains, but I knew if I did they would see me as soon as it was daybreak. Then I thought I might just as well jump overboard, and make an end of it, as be pitched over; directly after, I fancied I could crawl under the spare sail that covered the long-boat, and lie there. Last of all, I made for the poop, meaning to try and climb down to one of the cabin windows, but I stopped halfway, on account of the binnacle-light, and crept back towards the fore-part, to see if I could get down to the fore-cabin passengers. But it was of no use, and the only wonder was that I did not run right into some one's arms; but the chances, perhaps, were not, after all, so very much against me, and I kept clear till they grew savage, and I could hear that they were cutting about at me with either knives or cutlasses; and in spite of my trouble then, I could not help wondering how they had come by their arms, for, of course, I could not know then how Van had stolen them from the cabin while the skipper was asleep.

'I may as well knock under,' I said to myself, and I was about to give up, meaning first to give 'em one more round, when I stumbled. Twice over I had felt my bare feet slip upon the deck, in what seemed blood, and had shuddered as I thought of how I should leave my footmarks all over the clean white boards; but this time I stumbled over what seemed to be a body, and should have fallen, if I had not gathered up my strength for a jump, and thrown myself forward, when, as if in one and the same moment, there was a crash as of breaking glass, a heavy fall, and then a foot was upon my throat, and a pistol held to my head.

CHAPTER VII.

I was that shaken and confused by my fall, that for a moment I could not speak, and when I could say a few words, I did not know who I was speaking to, expecting that it was Van, till a voice I seemed to know whispered: 'If you attempt to move, I fire.'

'I ain't going to move, Mr Ward,' I says at last: 'it's been too hard work to get here; but if you'll pynt your pistol up at the skylight, it'll be better, or some one else will be tumbling down after me. Only wish Sam Brown would.'

'Pitched me down more'n half a hour ago,' growled a voice I knew.

'What's come of Bill Smith?' I says.

'Lyin' on the deck with his head split,' says Sam, 'if they ain't pitched him overboard.'

Then I heard a whispering consultation going on, which seemed to be about whether I was to be trusted, when Mr Ward seemed to be taking my part, and then the skipper whispers to me: 'If you'll be faithful to us, Roberts, you shall be well rewarded; but if you play fast and loose, mind, we are well armed, and there will be no mercy for you.'

'Who's playing fast and loose?' I says gruffly as old Sam. 'Ain't I been cut at, and shot at, and then pitched neck and crop through the cabin skylight! If that's your fast and loose, give me slow and tight for a game, I says; but mind you, it's my opinion that there's something else to do but play, for them beggars mean mischief.'

'I'll be answerable for him, Captain Harness,' says Mr Ward; and though all this went on in whispers, there wasn't a face to be seen, every light having been put out. 'You may trust him, he's no spy.'

'Spy be hanged!' I says. 'Who's going to play spy down here, in a place as is dark as an empty pitch-kettle in a ship's hold! Don't I tell you I've

Digitized by Google

had to cut and run for my life, and what more do you want?'

'Nothing, my man,' says Mr Ward; 'only your help as a good and true British sailor, for here are women and children for us to protect.'

'However shall I get to my birds?' some one says from out of the darkness.

'Birds!' I says: 'you won't want no more birds, sir, for it 's my impression as we 're going to be kept caged up ourselves now.'

Just then I seemed to catch just a faint glimpse of a face from out of the darkness, then it was gone again, and half a minute after I got another glimpse, and then another, when it was plain enough that the day was breaking; and by degrees the pale light stole down through the skylight, till the anxious faces of all the passengers, with the two officers and Sam Brown, was plain enough to see; and strange, and haggard, and queer they looked; but for all that, there was an air of determination amongst them, that shewed they meant mischief; and I soon gathered from Mr Ward's words that he was spurring the captain on to try and retake the ship.

'I 'm afraid it would only be a sacrifice of life, if I did,' said the skipper.

'It would be a sacrifice of duty, if you did not sir,' says Mr Ward warmly.

'Perhaps you 'd better retake her yourself, sir,' says the skipper sulkily.

'I certainly shall try, sir, if you do not do your duty to protect these helpless women. But we have a right to demand your assistance, and we do; while I have the word of every man present that he will fight to the last gasp for those who need our protection.'

'I cannot fight, but I can load for you,' said a voice from behind; and looking round, as many of us did, there stood Mr Bell, pale as a ghost, but quite calm, and leaning upon his sister's arm; while, if I could have seen anything in a woman to admire, I should have said she looked beautiful just then—being quite pale and calm—like the sea of a still morning before the sun rises.

'There 's something to fight for there,' says Sam in my ear.

'Why didn't they all stop at home?' I says. 'Just look what a mess they 've got themselves in through being aboard ship, which is the last place as they should be in.'

What Mr Ward had said seemed to have warmed the captain up; for sooner than see another take his place, he set to, and began to hunt out what arms he could find, after placing Mr Ward to guard the broken skylight, which he did with a revolver and a thin skewer of a thing out of a walking-stick, and it put me in mind of what I have read about some one being put in the fore-front of the battle; but the young man never said a word; and then, after a bit of a rummage, the captain came back to serve out what arms he could get hold of, but that wasn't many, for the enemy had pretty well emptied the locker where they were kept. A precious poor lot there was left for us to defend ourselves and a whole tribe of women and children; my share being an empty pistol, which didn't seem to be so much use as a fellow's fist, that being a handy sort of weapon in a tussle.

Everything was done quiet as could be, so as not to let them on deck know what we were doing; but as soon as the arming part was finished, and I looked round, I could see that the game was up, for two more pistols, two cutlashes, and a couple of guns—sporting-guns, that two of the passengers had used to shoot sea-birds with—was all we could muster.

As is always the case when it 's wanted, neither of these passengers had any more powder; and when Mr Ward's little pistol-flask had been passed round once, there was not another charge left; but the captain had gone to get more, and we were expecting him back, piling up hammocks and bedding the while, to keep the mutineers off, and to have something to fight from behind. I was doing all I could, after shoving a good charge of powder and a whole handful of small-shot into my pistol, when Mr Ward beckons to me and whispers: 'Go and see why he don't come back: it 's time to be on the alert, for they are moving on deck.'

I stepped lightly off—my feet being bare, making no noise on the planks—when coming upon the captain quickly, I saw him just putting down a water-can, and he turned round to me, looking pale as a sheet, as he says: 'It 's no use, my lad; resistance would be vain, for they 've contrived to wet what powder we had. Look at it.'

He pointed to the little keg and a small case of cartridges, and sure enough they were all dripping wet, while it seemed rather surprising that the wetting looked so fresh. But I did not say so, only that Mr Ward hoped he 'd make haste.

'Curse Mr Ward!' he muttered; and then he went on first, and I followed with my cheeks blown out, as if I was going to whistle, but I didn't make a sound for all that.

'I fear that we must give up, Mr Ward,' says the skipper, 'for the powder is all wet.'

There was a regular groan of dismay at the news, and one woman gave a sort of sob, else they were still as mice, and the children too behaving wonderful.

'Who talks of giving up?' says Mr Bell, his pale face flushing up as he spoke, holding one hand to his side. 'Do you call yourselves men to hint at such a thing? I am no man now, only a broken, wasted shadow of a man, or, by the God who made me, Captain Harness, I 'd strike you down! Look at these women, men! think of their fate if those scoundrels get the upper hand—completely—Mr Ward—you—as a gentleman—my sister—God help'——

The poor young fellow staggered, and would have fallen, for the blood was trickling down upon his shirt-front—gushing from his lips; but Mr Ward saved him, springing forward as a cry burst from Miss Bell; and he was laid upon a mattress in one of the cabins fainting—dying, it seemed to me.

Then there was a murmur amongst the passengers, of such a nature that Captain Harness found he must make some show of a fight, or it would be done without him; and accordingly he took hold of a very blunt cutlash, looking very pale, but making-believe to tuck up the wristband of his shirt, to have free play for killing six or seven of the mutineers.

As for the passengers, all mustered, there was about eighteen of them; and had they been well armed, numbers being about equal, I don't think we should have had much the worst of it; but ever so many of them had no arms at all, and I began to turn over in my mind what was to be

Digitized by Google

done. I had a pretty good jack-knife; and not having much faith in the pistol, I was about to trust to the bit of steel, same as Sam Brown, who had one with a spring-back and a good seven-inch blade, so I says to Tomtit: 'P'r'aps you'd like the pistol, sir;' and he took it quietly and earnestly, tapping the back, to make sure the powder was up the nipple, and I thought to myself, that's in the right hands, anyhow.

'Are you ready?' says the skipper; for they were evidently collecting up above, and some one fired a pistol down the skylight, but none of us was hit.

'Not quite, sir,' I says.—'Steward, suppose you hand out some of them knives o' yours; and I'll trouble you for the big beef-carver, as I spoke first.'

Mr Ward turned round and smiled at me; and I gave him a nod, turned up my sleeve too, and then laid hold of the big carver, which did not make such a bad weapon, being new, sharp-pointed, and stiff; while my idea had put a knife into a dozen hands that before had nothing to shew.

'Pile more mattresses and hammocks up,' said Mr Ward; for it was plain that neither the skipper nor Mr Wallace meant to do much towards what was going to take place; and then I saw the doctor give one look towards where Mr Bell was lying, and run across, as if to see how he was; but he hurriedly caught hold of Miss Bell's hand, and I could see that he spoke, while, as she drew her hand hastily away, she gave a strange frightened sort of look at him. Next moment he was back at my side, just as the cabin-hatch was flung open, and the shuffling of feet told that the mutineers meant to make their rush.

OUR PUBLIC STATUES.

We certainly cannot compliment ourselves, or expect to be complimented by others, on our success in regard to public statues. We can doubtless make a statue, and a good one too; or rather, our sculptors can when left to their own genius; but there is nearly always something or other to bring trouble and disappointment in connection with their efforts. If a statue is to be paid for, wholly or in part, out of the public purse, Lords and Commons insist on having a voice in the matter; there are committees and commissions; there are boards and departments; there are referees and judges. As all these worthy tribunals are composed of worthy people claiming to have a taste, the upshot is that some of them check the rest, and are checked in turn, until a general checkmate is effected.

And yet our public statues comprise some fine works, executed by sculptors whose names will live. There *ought* to be something good provided for us from the chisels of Chantrey, Baily, Wyatt, Westmacott, Marshall, Foley, Bell, M'Dowell, and Marochetti; and selecting in the metropolis such statues as are under the charge of that much-harassed official, the Chief Commissioner of Works and Buildings, we find them (from a recently published parliamentary paper) to be about forty in number. There are other statues, it is true, which have been erected at the public expense, or from the public purse in aid of private subscriptions, and placed in royal or national palaces, in St Paul's, or in Westminster Abbey; but these do not come under our present notice.

Most of these forty have an obscure biography, and are honoured by very few glances from the public eye; but the history of some of them is curious and notable.

The equestrian statue of Charles I. at Charing Cross is among the best placed and the best looking of the whole. Modelled by Lesueur, about 1638, on commission from the Earl of Arundel, it was cast in bronze, and set up on its pedestal. When the hapless monarch had been consigned to the block, his statue became as unpopular as himself; it was taken down, by order of the revolutionary parliament, and broken up; or rather, it was sold to one Rivers, a brazier in Holborn, with strict injunctions that it should be broken up. But Rivers was either a royalist or a sly-boots; he kept the statue intact, buried it underground, and drove a brisk trade in bronze-handled knives and forks, pretending that the bronze was derived from the statue. Long after the season of turmoil, when the royalists and Charles II. were in power and in fashion, the bronze statue came forth into light, and was set up in 1674 on the present pedestal, which was executed by Grinling Gibbons. The poet Waller praised the king and the statue with most courtly panegyric; but Andrew Marvell contrived to make a good deal of fun out of both. Sir Robert Vyner, Lord Mayor of London, about that time put up a statue of Charles II. at Stocks' Market, on the spot where the Mansion House now stands; and as Marvell had not much more love for the one monarch than for the other, he wrote a satirical dialogue, purporting to be held between the two bronze horses. Each horse reviled the monarch who bestrode the *other* horse—the one attacking the profligacy of Charles II., the other the despotism of Charles I. Charing Cross, making an onslaught on Stocks' Market, said, among other bitter things, it was wondrous

> That he should be styled Defender of the Faith,
> Who believes not a word that the Word of God saith!
>
> . . . . . .
>
> Though he changed his religion, I hope he's so civil
> Not to think his own father is gone to the devil.

—and many other pretty things of the same kind. The sword held by Charles I., in the statue at Charing Cross, is a modern one. The odd story concerning the substitution of the new sword for the old, we will take from Chambers's *Book of Days*: 'In *Notes and Queries* for 1850, Mr Planché asked: "When did the *real* sword of Charles I.'s time, which but a few years back hung at the side of that monarch's equestrian figure at Charing Cross, disappear; and what has become of it? This question was put, at my suggestion, to the official authorities by the Secretary of the British Archæological Association; but no information could be obtained on the subject. That the sword *was* a real one of that period, I state upon the authority of my learned friend, the late Sir Samuel Meyrick, who had ascertained the fact, and pointed out to me its loss." To this query, Mr Street shortly afterwards replied: "The sword disappeared about the time of the coronation of her present Majesty, when some scaffolding was erected about the statue, which afforded great facilities for removing the rapier (for such it was); and I always understood that it found its way, by some means or other, to the museum (so called) of the notorious Captain D——; where, in company with the wand of the

Digitized by Google

Great Wizard of the North, and other well-known articles, it was carefully labelled and numbered, and a little account appended of the circumstance of its acquisition and removal." The editor of *Notes and Queries* pointedly added: "The age of chivalry is certainly past, otherwise the idea of *disarming a statue* would never have entered the head of any man of arms even in his most frolicsome mood." We may conclude, then, that the *present* sword of this remarkable statue is a modern substitute.'

None of our other statues come up to this of Charles I., in what may be called sensational incidents; though several among them have been much talked about. In the open quadrangle of Whitehall Yard or Gardens is Grinling Gibbons's statue of James II., set up in 1686. Queen Anne is to be seen in all her glory in two squares named expressly in her honour—Queen Square, Westminster, and Queen Square, Bloomsbury—by whom executed, 'your deponent knoweth not.' George II. is seen by a few, and only a few, Londoners, in a place once very fashionable and lively, but now among the most unlively quadrangles in the metropolis, Golden Square. George III., of glorious memory, has more than two effigies, we imagine, within metropolitan limits; but those under the command of the Board of Works are the one by Bacon in the quadrangle of Somerset House, and Wyatt's 'pigtail statue' in Pall-Mall East. The latter has been a good deal laughed at; for royal George's pigtail stands out horizontally in a most mirth-provoking way. When this statue was first cast, in 1836, permission was obtained to set it up in the triangular space of ground where Pall-Mall East and Cockspur Street meet—not a bad place for a statue, all things considered. But certain clauses in the leases of certain houses near at hand provided that the said triangular space should be left unoccupied; and the inhabitants objected to the pigtail statue as an ugly sight. The affair was brought before the Vice-chancellor's Court, and the Solicitor-general urged that the Pall-Mall-Easters ought to be proud at having so good a statue of so good a king—but they did not seem to see it. The Vice-chancellor decided that the leases entitled the inhabitants to expel the statue from the selected spot; but the Lord Chancellor, on appeal, decided that the leases did *not* give this power. And so the statue remained, to stand its chance of being welcomed as a work of high art. If the pig-tail would wag a little—but it won't; it only stands out to invite the east wind.

Coming down to the time of George the Magnificent, we find Chantrey's equestrian statue of that monarch, at the north-east corner of Trafalgar Square—set up, not during George's time, but in 1845. Several statues of notabilities are to be met with in the squares of London, not included in the present list, because they are not under the supervision of the Board of Works—such as those of the Duke of Cumberland, in Cavendish Square; Lord George Bentinck, also in Cavendish Square; the Duke of Bedford, in Russell Square; Charles James Fox, in Bloomsbury Square; William Pitt, in Hanover Square; the statue of the Queen, in the Royal Exchange; Sir Robert Peel, in Cheapside; the Duke of York (stuck up so high, as a wag suggested, to be 'out of the reach of his creditors'), and the Guards' Memorial, in Waterloo Place; Lord Herbert of Lea, in front of the War-office; and, latest of all, Richard Cobden, in Camden Town.

As to the Great Duke, the controversies concerning his statues have been almost interminable. Passing by Milnes's, on Tower Green, and Chantrey's, in front of the Royal Exchange (which have passed pretty well through their troubles), there is at the present time in preparation a statue, tomb, sarcophagus, mausoleum, or something of the kind, which is to be placed in or under St Paul's Cathedral. Money has been spent upon it somewhat lavishly; but hardly any of us can tell who is executing it, how long it has been in hand, when it will be finished, what will be the ultimate cost, or what it will be like when done. Then there is the Achilles Statue in Hyde Park, erected in honour of the Duke in 1822. It was a ladies' present to the nation, and was, as the inscription tells us, 'Inscribed by the Women of England to Arthur Duke of Wellington and his brave companions in arms.' It was cast by Sir Richard Westmacott from cannon taken in the victories of Salamanca, Vittoria, Toulouse, and Waterloo, at a cost of ten thousand pounds. Besides adverse and somewhat indecorous criticisms on the practice of adopting the nude antique in celebration of modern heroes, this statue has been called a misnomer; it is not Achilles at all, but merely a copy from one of the unnamed antiques at Rome. But the most stormy 'Duke' we have had is that which surmounts the arch at the end of Constitution Hill, Hyde Park Corner. When Mr Wyatt had completed it, the question arose where to place this Brobdingnagian work of art. It is the largest equestrian statue ever cast in this country; and it took about twenty of Barclay and Perkins's magnificent horses—in lieu of all the Queen's horses and all the Queen's men—to draw it from the sculptor's studio (or rather from the caster's foundry) to its place of destination. What a battle there was! Commissioners of Works urged how grand it would look to have the Great Duke's effigy just opposite the Great Duke's mansion, and at the end of the fine drive leading from the royal palace. The architect, on the other hand, protested that his arch was never intended to support a gigantic equestrian statue; and he was backed by connoisseurs, who denounced the bad taste of the whole affair. But the 'Works' conquered; and, as we all know, the bronze Duke has remained there ever since, pointing to something (nobody knows exactly what), and looking very funny in his cocked-hat and cloak.

Then, again, there is Nelson. None under middle-aged folk can remember the day when that Trafalgar Square statue and column were first begun. It was thirty years ago; and the work is not yet really finished! Mr Railton designed the column itself, which was built very slowly. It is admitted to be a good thing of the kind; but then came a question whether a Corinthian column would form a proper support for a statue of a naval hero. After abundant wrangling on all sides, this question was decided in the affirmative; and Mr Baily was employed to chisel a statue of Nelson in granite. It really matters not much whether the statue is a good one; for it is perched up so high that excellences and defects are all one. The money went quite as fast as it came in; and parliament was invited to come to the aid of private subscriptions, in order that the bas-reliefs on the four sides of the pedestal, and the

Digitized by Google

four lions at the corners, might be finished. The four bas-reliefs were, in the lapse of years, executed (by Carew, Woodington, Ternouth, and Watson); the enormous lions, by Sir Edwin Landseer, were finished, and set in their places; the critics renewed the criticisms which they had commenced more than a quarter of a century before; and people are still prone to ask whether the forty thousand pounds sunk in the Nelson Column and its appendages were well invested.

Sir Charles James Napier's statue in Trafalgar Square, by Adams, and Sir Henry Havelock's in the same locality, by Behnes, were set up about ten years ago—paid for by private subscriptions, but honoured with a sort of governmental care and recognition. Then there are Marshall's statue of Dr Jenner, in Kensington Gardens; Noble's Sir John M'Grigor, in the grounds of Chelsea Hospital; the same sculptor's statue of Sir John Franklin, in the garden of Carlton House Terrace; and Foley's Sir Charles Barry, in or near the gorgeous legislative palace which that architect built. As to Baron Marochetti's Richard Cœur-de-Lion, in Palace Yard, one does not quite see the connection between the man and the building in front of which he is placed, however much we may admire the sword pointing bolt upright. The statues of Canning and Peel, in the open space near St Margaret's Church, have been subjects of furious war, honourable members having almost come to blows about them—in relation to the artistic fitness of the sites; indeed, it is not improbable that, by the time this sheet reaches the reader's hands, Sir Robert will have been dethroned altogether, pending the choice of a new locality for him. As to the six statues of kings, in Westminster Hall, intrusted, in 1867, to Thorneycroft, Weekes, Woolner, and Theed, we must wait a little longer before deciding whether to quarrel about them or not. And as to the statues of Hampden, Selden, Walpole, Falkland, Clarendon, Somers, Chatham, Mansfield, Fox, Pitt, Grattan, and Burke, in St Stephen's Gallery, there has been no end of grumbling; because, neither in this Gallery nor in Westminster Hall is there a statue of Oliver Cromwell—which, as regards our national history, is something like leaving out one whole section from Hume, and a good many sections from Carlyle.

LITTLE VENICE.

When the first Spaniards who came to the American coast, the famous (and infamous) Conquistadores, discovered the territory north of the Brazil, they found the Maracaibo tribe living in huts which were built on piles in a lake. The similarity of this primitive architecture to the style of beautiful Venice suggested to the invaders, who had a turn for poetical nomenclature, to name the new 'annexation' Venezuela, or Little Venice. The term, which was more pretty than appropriate even then, is an absurd misnomer now, when it has been extended to a region 'four times the size of Prussia, which comprehends a forest larger than France, steppes like those of Gobi, and mountain tracts which it would take many Switzerlands to match.'* Probably very few people who have not been there know much about Venezuela. The charm of the unknown hangs around the South American republics in an unusual degree, considering how very high in the sky is the sun of universal knowledge at this time of day. People know that they are tremendously big places, in one sense, but conceive that they are very little in another; and outside that not very sound or sagacious generalisation, they have a vague notion that the history of these immense tracts of the beautiful earth is roughly composed of revolutions, civil and other wars, a bewildering succession of 'presidents,' shaky public credit; loans, attended with difficulty and distrust; hovering wild Indians, popularly known, or rather unknown, as 'tribes;' heat, earthquakes, bull-fights, bell-ringings, 'processions,' Spanish manners, and easy morals. As far as Venezuela is concerned, Mr Eastwick gives his compatriots an opportunity of learning all about life in that part of the world, which they may avail themselves of, without any apprehension of finding the process merely useful.

Landing at La Guaira, which he declares to be 'the hottest place in the world'—a distinction which tropical tourists claim for many other localities—he first, of course, abuses the mosquitoes, and then acknowledges that the port, otherwise detestable, is one of the most picturesque places imaginable, with its huge blue, black, and green masses of rock heaped up into the clouds, forming a mountain, rising abruptly from the sea to a height of eight thousand feet. La Guaira is a dirty place, where nobody ever takes any exercise, and where, 'as there are no Englishmen, outdoor amusements are unknown;' so the traveller started for Carácas, and had his first experience of a Venezuelan mountain-road. After an ascent of a thousand feet, the heat is less unbearable; but the speed is terrific, and the recklessness of the drivers great. Here is a pleasant anecdote: 'The turns were so abrupt as to be quite invisible while one was approaching the precipice, from which they diverged almost at right angles. We seemed to be galloping straight into the abyss, and we did reach its very brink, and then swept round by a turn in the road, which only at that moment shewed itself. There are similar roads over the mountains in Peru, and it is said that a late president of that country got so alarmed on one occasion, that he shouted to the youth who was driving to stop. The *mozo*, however, rather enjoying the joke, drove on faster than ever, till the president, drawing out a pistol, called to him that he would shoot him dead unless he pulled up instantly. This was a hint not to be disregarded, so the youth obeyed, but turned round and said, with the usual freedom or impudence of the country: "Truly, you're a fine fellow to be president of Peru, if you are afraid of such a trifle as this."'

Mr Eastwick arrived at Carácas in the midst of a *fiesta*, which indeed it would seem difficult to avoid. South American Catholicism is very joyous and buoyant in its manifestations. Bell-ringing and fireworks are perpetually going on; and the women, who, at Carácas, are remarkably beautiful and graceful, are perpetually meeting together, and walking to the churches in bevies, a religious exercise which is regarded with much approbation by the male sex. The Venezuelan ladies have dark complexions and little bloom, but they 'whip creation,' according to enthusiastic Yankee evidence, in the attractive particulars of large black eyes, brilliantly

* *Venezuela, or Sketches of Life in a South American Republic; with the History of the Loan of 1864.* By Edward B. Eastwick, C.B., F.R.S., &c. London: Chapman and Hall.

white teeth, slight waists, and faultless feet and ankles. The site of the Venezuelan capital is both strong and beautiful, but Valencia would be a better seat of government, as it possesses the richest soil and the best seaport in South America. The environs of the capital are sadly interesting, by reason of the traces of the awful earthquake of 1812, which did its work with suddenness almost as appalling as that which destroyed Manila. There is much simple force in this description: 'On Holy Thursday, 26th March 1812, the churches were crowded with ladies dressed in their gayest attire. The chapels of the convents were filled with nuns, the streets with people from the neighbouring villages. At the barracks of San Carlos, a regiment of six hundred men were mustering under the walls. There was not a cloud in the sky, nor a thought of danger in the heart of any one. Suddenly the earth seemed to move upward, the church bells tolled, and a tremendous subterranean noise was heard. The perpendicular motion lasted four seconds, and was instantly succeeded by a violent undulatory movement, which continued six seconds more. In those ten seconds that great city, with fifty thousand inhabitants, had become a heap of blood-stained ruins. The churches of Alta Gracia and Trinidad, with towers one hundred and fifty-one feet high, were so completely levelled, that in their place only shapeless mounds remained, spread out to a great distance, but not more than five feet high. Every convent was destroyed, and of the inmates scarcely one escaped. The barrack of San Carlos was hurled forward from its base, and of the six hundred soldiers mustering below its walls, not a man was left alive. A vast cloud of dust rose up to heaven, and with it ascended the shrieks of more than twenty thousand human beings dying or wounded in the ruins. Great rocks came thundering down from the mountains, and at intervals explosions, like the discharge of innumerable pieces of artillery, were heard beneath the earth.' No wonder that the survivors were so terrified that they could not go to their customary work for long afterwards, but were continually absorbed with prayer and religious exercises. But one would like to know who was the individual who, amid the horror and the appalling danger of the hour, timed the earthquake so neatly as to know it lasted just ten seconds.

Two objects of interest are to be found in the Cerro d'Avila, near the capital: the first is the Catholic cemetery, the finest in South America; and the second is the Torna, or reservoir, which supplies the city with water. The Torna is situated in a thickly wooded ravine, and a very narrow path leads to it, surmounted by a rocky terrace, which is a favourite promenade for snakes. It is not uncommon to see a reunion of forty or fifty rattlesnakes and other serpents taking the air and the sun in that spot. Wages are very high in Carácas, trade is good, the people have a taste for amusement, and altogether Mr Eastwick considers that 'if it were not for earthquakes, epidemics, insect plagues, triennial revolutions, and bell-ringing, there would be few more desirable localities for a residence.'

Republicanism finds its full expression in Venezuela, not always satisfactorily to the visitor accustomed to other institutions. Little Venice is the paradise of servants, or rather, as Mr Eastwick has it, of 'the vagrant ladies and gentlemen who pay you short visits to replenish their purses and wardrobes, leave you without notice, and severely repress any attempt to communicate with them as to your domestic arrangements.' You may talk with them on general subjects, such as the weather or the theatre, and on politics you may be as expansive as you please; for where any one may become a general or a president in a few days, that subject is universally interesting. The theory that one man is as good as another appears to have acquired in practice in this happy land the Irish corollary of 'and better,' judging from the following amusing anecdotes: 'In one of the best houses where I was a guest, the gentleman who cleaned the boots always came into my room with his hat on, and a cigar in his mouth; and another gentleman, whom I had engaged to assist Juan, left me the day after his arrival, on being refused the custody of my keys and purse, which he candidly stated was the only duty he felt equal to. On my sitting down to play chess with the wife of the president of one of the states, half-a-dozen female servants, of every shade, from tawny twilight to black night, surrounded the table, and began to watch the game. The first time I went to a tailor, I was accompanied by a Creole friend, who undertook to shew me the best place. We had to wait some time before the gentleman of the shop appeared. When he did, he came in with the inevitable cigar in his mouth. He raised his hat politely to my friend, walked straight up to me, shook hands, and asked me how I did. He then sat down on the counter, put various questions to me regarding my coming to Venezuela, talked on general subjects, and at the end of a quarter of an hour intimated that he was ready to oblige me if I wanted a coat. This tailor was an officer in the army, and coming in on one occasion to measure a friend of mine, wore his uniform and spurs.'

Public honour and honesty do not attain to a high standard. There is too much adventuring, too little stability, and not enough grave, dignified public opinion. Perception of the progress of the United States, and jealousy of that progress, do not suffice to inspire the Venezuelans with energy and steadiness enough to enable them to emulate it; and education is at a very low ebb. The country, with great resources, is wretchedly poor, and is eternally borrowing. It is difficult to discern the objects of expense. 'You Venezuelans,' said Mr Eastwick to a well-informed native of Carácas, 'are not extravagant. Your soil is the richest in the world, and has never been trodden by an invader since the Spaniard was driven out. Then why are you always borrowing from other countries? How is it, when the northern republic has made such progress, the population here is all but stationary; the seas and rivers are without steamers, the country without roads, and commerce languishing?' In a condensation of the Creole's reply may be found a sketch of all which Mr Eastwick's book advances. As to the superiority of North America, he explained it first by the difference in 'the breed,' by the active and mercurial temperament of the 'Yank,' and by the fact, that long before Lexington and Bunker's Hill, the Northerns were fit for self-government; while the Southerns are not fit for it now. The Spaniards kept their subjects ignorant. There were no schools; and the first printing-press was set up at Carácas in 1816. The Spaniards did nothing to introduce the cultivation of any plant, or improve farming.

Digitized by Google

The culture of the vine and the olive was prohibited, and that of tobacco was made a crown monopoly. Emigration was all but prevented. Under the circumstances, it is rather a wonder that the republic should exist at all, than that it should have made so little progress. Mr Eastwick enters very fully and lucidly into the causes of the chronic impecuniosity of the country; and sad and serious as the facts are, it is impossible not to feel some amusement at the coolness and ingenuity with which the robbery of the public is carried on. It is not too much to say that all the revolutions at Venezuela commence at the custom-houses. 'Owing to the frauds of the officials, the revenue falls short; to make up the deficiency, the customs are raised, until the necessaries of life are too dear for men of small means. Thus discontent is sown broadcast; and discontent leads to conspiracies.' According to the published returns, the Venezuelans must be the dirtiest in the world with any pretensions to civilisation, since it is officially made out that a quarter of an ounce of soap in a week is all that each person uses. The province of Carácas alone consumes a hundred barrels of flour a day; but according to the custom-house returns, the daily consumption of all Venezuela does not reach sixty-nine barrels. Under such circumstances, it is no wonder that the public treasury is empty, and that money has to be borrowed in foreign markets. A large portion of Mr Eastwick's book refers to the proceedings respecting the Venezuelan loan of 1864, for which he was commissioner.

Arrived at Valencia, the stranger is struck with the strictly republican style in which the business of the government is carried on, the council meeting in a plain room, without one superfluous article of furniture, while external loiterers lean on the window-sills, and stare at the debaters. The Valencians seem to be happy, idle, and ignorant people, with a splendid faculty for basking in the sun, and plenty of sun to bask in. Looking down on the city from the Morro, Mr Eastwick asked himself how it was that in three centuries it had made so little progress in wealth, population, and importance, endowed as it is with a healthy and beautiful site, a soil unmatched for fertility, a position on one of the great high-roads of South American commerce, and near the unrivalled harbour of Puerto Cabello.

A broad expanse of beautiful vegetation stretches on all sides around the beautiful lake of Taricagua, the principal ornament of one of the loveliest scenes in the world. Looking across its breadth, towards the city, one sees 'a glittering expanse of silver water, studded with fairy islets, rich masses of foliage of every hue, a city in the distance that seems built of white marble, and hills that gradually swell into blue mountains.' Ascending the mountains, the traveller still sees the beautiful lake, until the grand forests intervene, and the scene then assumes another aspect of the Protean, but omnipresent beauty of the tropical countries. In one of the mountain ridges, after he had left far behind him the famous valley of Araguas, the traveller was caught in a sudden shower of the fierce, pelting, sweeping rain which he had experience of in similar regions. He and his attendant looked about for shelter, and found it, under these circumstances—the only story of a sinister sound, the only trace of grimness in a remarkably pleasant book. 'Seeing a low hut on the side of the road, we made up to it, and knocked. The door was opened by a short but very squarely built woman of middle age and forbidding appearance, who objected strongly to our entering. However, the storm looked even uglier than she did, so we would not take a denial, but went in, and seated ourselves on a rude bench. I asked her how she could live alone in such a wild forest. She said she had had a friend, who had been killed by a snake, but that she was not afraid to remain, though alone. She added that she should very likely be bitten by a snake too, for serpents of all kinds were most numerous, especially *cascabels* (rattlesnakes). There were also *tigres* (panthers), she said, but she did not fear them much. It afterwards occurred to me that she was probably a leper, and consequently safe from human savages, and necessarily an outcast.'

A simple, plain picture of one of the most melancholy conditions of existence possible to a human being—a whole tragedy in a few lines, the story of a life of fear, privation, and utter solitude.

The resources of Venezuela, as regards mineral and vegetable wealth, are enormous. The gold-fields in Guayana are probably among the largest in the world. Between Arva and Nirgua, there is a silver mine. The Quebrada mines, of red copper, yield an ore superior to that of Sweden, Chili, or Australia. There are several other valuable copper-mines. Iron is abundant in Panina, in Guayana. Tin mines are numerous, and lead mines exist in Tocuyo. Coal is found in Coro. Trujillo and Cumaná have rich mines of petroleum, and there is a valuable salt mine at Aragua; a sulphur mine at Avechez, and abundance of earth suitable for porcelain. Garnets are found in the Silla Mountain, near La Guaira; and along the sierra of the coast are inexhaustible supplies of marble, granite, slate, rock-crystal, gypsum, and lime. The vegetable wealth of Venezuela is almost incalculable, its items are beyond counting. Coffee, cocoa, cotton, sugar-cane, tobacco, and indigo are among the chief; and of the extraordinarily abundant coffee-crop, twenty per cent. is generally lost for want of hands to get in the harvest. Among the innumerable treasures of the beautiful tropical forests, the following trees are especially worthy of mention: 'First, the palms, which grow at any altitude, from the level of the sea to three thousand three hundred feet above it. They yield fruit, a vegetable like the cabbage, oil, cordage, thread, hats, roofs for the cottages of the Indians, rafters, wine, ship-timber, wax, mats, bread, soup, sieves and baskets, and many other things useful for man, in number at least a hundred. The tuma, or cactus, valuable for its pleasant fruit, its repulsive spicula, which render it the best of all hedges, and as being the abode of the cochineal insect, which is also found on the pear tree. The candela supplies tallow for candles, oil for lamps, and a beverage, made from its toasted fruit. More curious still, perhaps most wonderful of all trees, is the *palo de Lecha*, or milk-tree, which supplies a milk like that of cows, but thicker; analysed, this product is found to consist of water, animal milk, and wax as pure as that of bees. Mixed with cotton, this milk is used for candles. To the parched traveller, the *bejuco de agua* supplies the place of wells and fountains, for from each yard of it a pint-bottle of water can be obtained. Not less useful in its own peculiar locality is the *frailejou*, which grows at the height of thirteen thousand

Digitized by Google

five hundred feet above the sea, in the region of the icy wastes called Parámos. Even in these wildernesses of death, the *frailejou* keeps the human body warm. It yields a turpentine superior to that of Venice.'

This is but a faint outline of the subjects treated by Mr Eastwick in his entertaining and instructive work. The effect of that book is to fill the mind with wondering admiration of the rich and majestic beauty, and the stupendous 'potentialities' of the republics, but also to recall to the memory, as applicable to Venezuela, the memorable Irish lamentation: 'Ah, then, but the world would be a lovely place, if it wasn't for the people that 's in it!'

PAWNBROKING IN SCOTLAND.

At the present time, the hue and cry of free-trade has been raised by that conspicuous class, the pawnbrokers, who no doubt are encouraged by the Report of the government commissioner recently appointed to inquire into the state of pawnbroking in Ireland, in which some relaxative measures are suggested for the carrying on of this trade in that country. The British pawnbroker wants the period which he is required to keep all pledges reduced from twelve months to six months; and in the event of free-trade not being conceded, wishes an increase of five per cent. to the present rate of interest allowed him—the present rate being twenty per cent. In other language, the accommodating 'uncle' wants for his careful trust of his nephew's Sunday suit of clothes, upon which he has advanced one pound, five shillings per annum instead of four shillings, as formerly, and to be paid every six months instead of yearly; certainly a radical difference.

Let us glance at pawnbroking as it is at the present. This business, though long sanctioned by parliament, and carried on in Britain, did not so rapidly expand until the statute was passed, 39 and 40 George III., which requires them to take out a licence, for which they pay L.7, 10s.; to enter all pledges in a book, stating the name and address of the pledger; and to furnish a duplicate for every distinct pledge, but for which they are now allowed one halfpenny, deducted from the amount at the time of pledging, when the sum lent is under ten shillings. The pawnbroker is forbidden to take any pledge from persons under twelve years of age; but by a certain Police Act adopted in many burghs, the age is sixteen. Nor is he allowed to receive a pledge from a person intoxicated; neither durst he receive goods in an unfinished state; parties having goods in pawn can have them, at the expiry of the twelve months, kept over for three months longer by giving notice in writing, or by taking a witness; and all pledges on which there has been advanced more than ten shillings, are, if forfeited, required to be sold by public auction, and the surplus, if any, handed over to the late owner, after deduction of expenses and payment of interest. To enable parties to know the proper rates of interest and charges for duplicates, a statement in legible characters has to be exhibited in a proper situation in the establishment. These, with many others, are enactments of parliament for the guidance of this business; but they are of little use, from the want of machinery to have them strictly enforced.

The pawnbroker in Scotland is to be found in any town or village which can number three or four thousand, and even in places which boast of a less population, if there happen to be any manufactories in the district; and should the three balls be absent, you will invariably find a host of brokers, or 'wee pawns,' as they are termed. Let us briefly notice the increase of pawning, from the extent of facilities offered for this traffic. We will suppose a community with a population of between three and four thousand, in the midst of which there are already located two pawnbrokers' establishments, each taking in, on an average, two thousand five hundred pledges per month, which gives five thousand received by the two establishments. A third person embarks in the business, and after being, say, six months in the 'trade,' receives two thousand pledges per month. We should conclude that, if the third pawnbroker receives pledges to that extent, the amount of pledges now received by the others must be diminished to a corresponding degree. But such is not the case; they rarely suffer any reduction, or if so, but to a comparatively small extent. Consult their stock-books, and you will observe that though they may be in the habit of receiving a few less pledges per month, their pledge stock, or, in other words, the amount of pledges remaining on their respective shelves, was never higher than at this period. Nor is it difficult to understand how such is the case. The pawning class avail themselves of every facility to ease themselves of most articles that can be converted into cash; and my old 'uncle,' who was wont to be careful in his dealings with his indefatigable 'nephews' and 'nieces,' suddenly turns quite affectionate, from the pressure of his more youthful brother in trade, and now receives from his nephew a pair of indifferent trousers which were formerly rejected, or tells 'John' to enter for his niece ninepence on a tartan handkerchief, which but a week ago he 'could not touch at all.'

Pawnbroking might be called a bank of deposit, as a considerable number of the articles pawned remain so for years, the owner, at the expiry of every twelve months, paying the interest on the sum advanced. This is what is designated 'renewing the ticket.' There is scarcely one of the habitual pawners but who has got goods lodged with the pawnbroker for a number of years. It is a difficult matter for the pawners, when once entangled in the meshes, to get clear again; that is, to be able to muster sufficient cash at once to get their goods redeemed—neither do they care to lose them, as they are often associated with family ties, or they have paid for them at some 'club shop' a large sum, and set a value on them which they really do not possess. The writer of this article knows an instance in which a poor man had a coat pledged for the long period of *eighteen years;* and often in such cases the pawner loses his goods in the end, thus contributing a sum of money yearly in no way advantageous to himself; and, on the other hand, the goods have been so much deteriorated in value, more especially if they be what is known as soft goods, that the pawnbroker rarely realises the sum he had originally advanced on them. The amount of pledges forfeited, as indicated by the pawnbroker's books, averages about six or seven in every hundred. It should, however, be understood that the quantum one hundred, in which six or seven are represented as being forfeited, includes pledges which have

Digitized by Google

been repeatedly pawned. Of the actual number of distinct pledges which have been pawned only once, probably the number forfeited will be over twenty per cent. But this again varies according to the nature of the town and locality; in manufacturing districts, the number forfeited being considerably less than in other districts. The number of pledges received by the pawnbroker in Scotland varies from one thousand to six thousand per month, and even reaches in one or two establishments as high as ten thousand; but the average is three thousand. It need hardly be said that these pledge stocks consist of a very miscellaneous collection, the great bulk, however, being wearing apparel, blankets, and other soft goods. Next in the list come watches and jewellery, books, workmen's tools, musical instruments, and in reality everything from a 'needle to an anchor.' Certainly a very liberal idea as to the multiplicity of articles received by the pawnbroker was evinced on the part of a poor man from a country district in the north, who, with an air of simplicity, inquired at the pawnbroker if he had 'ony way for a coo.' I may state another case, as illustrating what desperate shifts may be resorted to to raise the needful. One afternoon, in a certain establishment, a commotion of a peculiar character was heard in the lobby by the assistants, amidst which they could distinctly recognise the noise of something unstrapping. Their wonder was soon set at rest by the apparition of a wooden leg; but though the probability of its redemption was backed up by the owner asserting 'he couldn't want it,' it, however, like the cow, was declined.

The main support of the pawnbroker is 'the weekly pledger,' whose custom is to pledge the Sunday clothes on Monday, and on receipt of the pay on Saturday, to redeem them. Generally, in establishments 'taking in' one thousand pledges in the week, nearly one half of these are pledged on the Monday. It has erroneously been set forth that the pawnbroker's shop affords facilities for theft, but this is really not the case, as comparatively few pledges received by the pawnbroker turn out to be stolen, and it is but giving him justice to state that very many cases are detected solely through his instrumentality. The fact of his having to lose the money advanced on stolen goods, stimulates a wholesome discretion in regard to the goods he takes in pawn. It is also currently believed that the pawnbroker makes a large revenue out of the forfeited pledges; this is a fallacious idea. Forfeited pledges, taking them all over, are a decided loss to him; perhaps in a few country towns, where no competition exists, it may be otherwise, but in the majority of establishments the loss on this head comes to be a serious item.

The systematic evasions of the law, in regard to pawnbroking, by the pawnbroker are notorious; and the ignorance of the mass of his customers, and the exposure prosecution would entail to the respectable pawner, secure the lawless trafficker. As may be supposed, it is in the rates of profit that the pawnbroker chiefly evades the Pawnbrokers' Act; for instance, the pledger is only entitled to pay one halfpenny for the duplicate, when under ten shillings; however, he is generally charged one penny when the sum advanced is six or seven shillings; and as the sum advances, an overcharge is made in the same ratio. In the case of interest, it is expressly stated 'that in all cases where any intermediate sum lent upon any pawn or pledge shall exceed the sum of two shillings and sixpence, and not exceed the sum of forty shillings, the person lending the same shall and may take by way of profit, as aforesaid, at and after the rate of fourpence, and no more, for the loan of twenty shillings by the calendar month, including the current month as aforesaid.' This section of the act is evaded to a great extent. In the first instance, we will suppose the pawner is wanting to redeem a pledge on which there has been advanced three shillings, while the pledge has been deposited one year. He will, in nine cases out of ten, be charged from ninepence, even, in some cases, to as much as one shilling, for interest; the statutory sum being sevenpence-farthing (which is giving the pawnbroker the benefit of the fraction); being, in the extreme case, an overcharge of thirteen per cent. Or, suppose five shillings and sixpence had been lent on the pledge, the person redeeming the pledge would have been charged even as much as one shilling and sixpence for interest; the statutory sum being about one shilling and a penny-farthing; while, singular to say, the pawnbroker never overcharges on an aliquot sum, that is, on two shillings and sixpence, five shillings, seven shillings and sixpence, &c., but just charges at the neat rate per month of one halfpenny, one penny, three-halfpence. By the fifth section of the Pawnbrokers' Act it is enacted, 'that in all cases where the party, or parties, entitled to, and applying for the redemption of goods pawned within the space of seven days after the expiration of the first calendar month after the same shall have been pledged, he, she, or they shall and may be at liberty to redeem the same without paying anything by way of profit to the pawnbroker for the said seven days, or such part thereof as shall then have elapsed;' and should the pledge be more than seven days entered into another month, and less than fourteen days, the pawnbroker is only allowed to take half a month's interest, in addition to the interest for the other complete months the pledge may have been in pawn. But this section might never have been in the act for all the consideration it receives from the pawnbroker. He considers himself liberal if he lets the pawner escape without paying another *whole* month's interest, if the pledge he is redeeming be two days more than a complete month. With regard to that section in which it is required that forfeited pledges on which more than ten shillings have been advanced, are to be sold by public auction, and the overplus paid to the owner, there have not been twenty cases in the same number of years in which this stipulation has been fulfilled. But, in reality, this is totally unworkable, as few pledgers give their correct address, and as few pledges realise, when sold, an overplus, when the interest is added to the principal, and payment of auctioneer's commission is made. Another clause in the act is generally evaded—it being required that a table of the rates of interest, as also the charges allowed for duplicates, be fixed in some conspicuous part of the pawnbroker's establishment. Possibly, by great industry, a 'table' may be discovered in some part of the interior; but printed in such small type, and in such a mutilated condition, that it would be a physical impossibility to decipher it, or even if near enough, to understand it. Indeed there is not a clause in the whole Pawnbrokers' Act but what is ingeniously evaded. These facts may appear startling, and lead to the impression

Digitized by Google

that pawnbroking must be a singularly lucrative business; but such is not borne out by facts. At the present time, there are about three hundred and forty pawnbroking offices in Scotland, each carried on with a capital varying from one thousand pounds to five thousand pounds; and in one or two exceptional establishments, a much larger capital is employed, but the average capital is about fifteen hundred or sixteen hundred pounds. Now, the net sum realised varies from fourteen to twenty per cent., never higher; and in the one or two joint-stock establishments that exist, never more than six or seven per cent. of a dividend is declared. Would the draper, grocer, or ironmonger, or indeed any tradesman, believe he was making a fortune with the same returns, considering the amount of capital invested?

The attempts made to establish pawnbroking offices in this country on the French system have proved a failure. The reason for this is that an establishment of this kind, carried on by a company, though charging a reduced rate of interest, cannot successfully compete with another carried on by private enterprise, because the former is generally managed in too formal a system, and values the pledges with too much nicety to receive the appreciation of that portion of the pawners who constitute the staple of the pawnbroking establishments, who prefer a higher advance for the time being to a low rate of interest, and cannot therefore get a sufficient sum invested in stock proportionate to the expense incurred in carrying on such establishments. But abolish private pawnbroking establishments, and the Mont de Piété here would, of course, be moderately remunerative. So exclusive a system would not, however, be consonant with our ideas of liberty. On the other hand, the proposal made by some interested parties to make pawnbroking a 'free-trade,' cannot for a moment be entertained. In short, for this matter there are the two extremes, both evils.

With respect to the shortening of the term of forfeiture from twelve to six months, much can be said in its favour. It is found, as might be expected from habitual pawners, that that class of property of which they are in no immediate want is very often left deposited with the pawnbroker to the very last day which it is required by law to be retained. Now, at the present rate of interest, the amount required at this period for redemption comes to be considerable, and many articles are allowed to be forfeited, which, had the interest been not so heavy, would have been redeemed. Another important matter with regard to this point is, that 'soft goods' get much deteriorated in value by being stored up for the long period of one year, more especially as the pawnbroker is compelled to economise his warehouse space, and, to facilitate delivery, each pledge has to be tightly tied up, which prevents the free admission of air. It should be considered, also, that the goods thus kept up get less in value by the changes of fashion, and goods forfeited of this class come to be a hardship to the pawnbroker, who, perhaps from the pressure of competition, has been compelled to advance the general market value at the time of taking in the pledge. Thus, had the forfeiture been six instead of twelve months, and, as it is found that generally winter goods are pledged in the beginning of spring, the pawnbroker would have been enabled to have sold his forfeited pledges of that class in the ensuing winter; but, under the present forfeiture, he is compelled to keep them for another season, for with winter goods, sales will not be effected in summer. Now, it will be apparent that had the forfeiture been modified, this class of goods being 'turned over' six months earlier, the pawnbroker would have been enabled to have given the pledger even a higher advance at the time of pledging.

A matter of particular importance to strike at the root of overcharging would be to compel the pawnbroker to print on the back of each ticket the rates of interest allowed to be charged for intermediate sums under two pounds, and particularly to cause the pawnbroker to give with each distinct pledge at the time of redeeming, a printed form, bearing the pawnbroker's address, filled up with the date of pledge, sum advanced, and interest charged, written in plain and intelligible handwriting; and that under a penalty for any wilful false filling up, or failing to grant such a form. As this would entail a considerable extra labour, and not a little extra expense to the pawnbroker, it would be but just to grant him some small remuneration for his trouble; government might sanction the charge of one penny for each duplicate above two shillings and sixpence, instead of one halfpenny, as at present. With respect to brokers' shops or 'wee pawns,' they should be taken under the strict surveillance of the municipal authorities, and no establishments that have back-doors, or where the owner lives on the premises, should be tolerated.

These are matters which affect our social system deeply. The pawnbroker's shop, that has in many a case stripped the child of its clothing, and emptied the house of its furniture, at the same time has enabled many good folks, struggling with poverty, to tide over difficulties till better times came. Such legislation, therefore, is demanded, as, while it will not shut the door on those that require sometimes to enter in, will not at the same time foster dissipation and encourage habits of thriftlessness.

FORTY SHILLINGS AND COSTS.

I HAD been all day trying to get from Aveminster to Chelchester by a country line, a London line, and a branch line of railway. In the first place, as the country line only ran three trains a day, passenger and goods together, necessitating weary shuntings at every station, we could hardly be said to have made a good start. In the next place, the strategic arrangement whereby the London line managed invariably to start its trains five minutes before the arrival of the 'up'-country train, making us wait for two hours at Marlbury Junction, to spite the country company, scarcely tended to rapid progress. In the third place, as it always happens to be the aim of a traffic-manager to endeavour to drive passengers on to the main line, and to visit with all possible retributive delays the hostile British public when it *will* travel on a branch, we could not be considered to have made up for lost time on the branch. In the fourth place, it didn't help us forward to be compelled to travel one hundred and twenty-seven miles round-about in a parabola, in order to reach Chelchester, which, at starting, was only fifty-eight miles from Aveminster. In the fifth and last place, we were not

Digitized by Google

got to Chelchester yet; and it would have been money in my pocket if I never had.

'Swinbro'—Swinbro'. Change here for Marchmont and Nutchley. Change here!'

Almost time for a change, I reflected, considering I had been nine hours out on a journey of fifty-eight miles, and was still far off from my destination. Looking out from my window of a first-class compartment, I saw it was a cheerless, drizzling night, and the railway porters were steaming in the misty air as they hurried to and fro past the gleam of the lamps. Remonstrating with the guard respecting our train being nearly an hour late, and the time past eleven at night, he soothed my irritation by telling me gruffly I had no business on a branch line, if I wanted to go anywhere; and if I would go to out-of-the-way places like Chelchester, I must be very thankful if the company put themselves to the expense of taking me there at all, considering branches didn't pay to work as a rule.

A solitary passenger then entered my carriage, or rather was banged into it by the guard. Another minute, and the guard had banged himself into his van, emitting the growl: 'Change here!' Our fiery and restive iron steed, no doubt weary with its headlong career of full twelve miles an hour, gave a heroic neigh of triumph, resembling a feeble crow, in emulation of past exploits, in days long before it was condemned to transportation on a branch, and dragged us off into the bleak night.

My companion was a tall, thin, middle-aged man, with a face lean and withered like a shrivelled apple, concluded below the chin by a stiff satin cravat. In a dress, tight-fitting, and of ancient and faded black, he looked altogether like a man who had run very much to seed, which perhaps accounted for the luxuriant growth of his arms and legs. Observing his clothes steaming with the damp air, I began to realise it was very chilly. It certainly was.

'Quite a change in the weather,' I remarked. 'Very cold to-night, is it not?'

'Don't feel the cold myself. Perhaps you would like *to change places with me*. There is no draught here.'

I replied I should be very pleased to do so, if not to his inconvenience; and accordingly we changed seats.

It *was* cold, and no mistake. I must have taken a chill, for I felt the cold creeping over me in a most unaccountable manner.

Looking at my companion on the opposite seat, on whom the lamp-light now shone full, I saw that his face was not so thin, nor his features so withered, as I had at first supposed; and I must have made a mistake as to his age, for he was by no means so old as I had previously judged. How cold it was to be sure! As I continued to look at him, I noticed his aspect changed momently—that he was growing younger; that the wrinkles in his face were filling out, and smoothing down; and that he was gradually becoming like some one I had seen before. As his cheeks grew round and ruddy, and his hair changed from gray to brown, before my very eyes, I became in such a state of nervous agitation, I endeavoured to cry out, but could not. I was paralysed with the cold—cold that seemed to make my limbs rigid, and numb my vitals; for I saw the man sitting before me was no longer a stranger—no mere friend or acquaintance: he had become ME!

I held up my hands, to try and shut out the sight, and as I did so, saw they were withered, and thin, and old. I pressed them on my brow, to see if I were dreaming; but I found it shrivelled, and seamed, and puckered. And I knew that this man, this fiend, had stolen my body, and given me his. Maddened with the discovery, I rose to my feet—*his* feet—which swayed beneath me, and I struck wildly at the vision of myself on the other seat. But I found my arms light as vapour, for they passed over his body, which went through them, giving me the impression of pain. It was a body of shade that had been given me for my own body of flesh and blood, which this wretch had stolen. By some sorcery or other, we had indeed changed places.

'Sorcerer-demon!' I cried out, only to hear myself speaking with his sharp, cracked voice. When I saw *myself* sitting opposite to me, coolly addressing me in my own voice, I could no longer credit my senses, if indeed I had any of them at all left of my own.

'Daresay you think you are speaking loud now,' he said.

I answered by calling the guard as loudly as I could halloo.

'Ah, you might call a good deal louder than that, if the carriage were full of passengers, and they could no more hear you than they could *see* you,' he continued, chuckling and screwing up my features into a hideously knowing grin, such as I could never have made them assume. 'You see, my friend, yours is a body of air, of shadow, insensible, impalpable to all but myself, just as it was to all but you when I entered the carriage. You wish, perhaps, to know who I am? Well, two years ago to-night, I was a passenger by this very up-mail. There was a collision with a stupid down-goods, you see, and the result was that several passengers were injured. One of them was—well, it's no use mincing matters—killed on the spot. Quite so: it was I. Yes, I am what you call a ghost, though we consider the word rather *infra dig.* amongst ourselves, and have a better term for it. Now I have told you what I am, you will like to know what I want? Very good. You shall see.'

The ghost in my body then began to feel in my pockets, from which he drew out my meerschaum, loaded it from my pouch, and lighted it with one of my Vesuvians.

'Ah,' he proceeded, whiffing the weed rapidly, 'you smoke very good stuff—Golden Leaf and Returns: not a bad mixture, though I prefer a little Latakia with it myself.—Not at all a bad body yours either,' he went on, eyeing the form in which he was sitting—'not at all a bad body; and it fits me to a T, only a little short in the arms. By the way, I find one of your front teeth a little loose, so don't say I did that, when you come to yourself again; and your nose is a little long for me, but I daresay it blows none the worse for that.' I shuddered as I saw him take out my handkerchief, and use it on that cherished organ of mine.

'Yes, I daresay now you feel the cold a little; I did at first; but it's nothing when you are used to it. I find your body very hot—being heavier than I am accustomed to wear; but it won't be for long. I require it "positively for this night only," as you say in your playbills; and will return it uninjured by the time we get to Chelchester. By the by, let me beg you to be a little

Digitized by Google

careful how you throw your arms about so much as you did just now, for my body is of a more delicate construction than yours; and being so thin in substance, I am afraid you will scag it under the armpits. You will observe, ladies and gentlemen,' he went on in lecturer's style, 'that if I take a lighted Vesuvian, and insert it in the cornea of the patient's eye, he will feel no pain.' Saying this, my dreadful companion proceeded to illustrate his remark by making a dive at my shadowy eye with a burning match. I felt no pain as the match burned in my head, certainly.

'You will allow, after all you see, that my shape has its advantages,' the ghost proceeded; 'but it also has its disadvantages. Try the pipe now.' I tried to take the pipe; it dropped through my vapoury fingers. He placed it in my mouth; I could not hold it, nor get a whiff from it. 'Precisely so,' said the ghost. 'Now, this is just what has brought me here to-night. A great smoker all my life, doing my six pipes a day regularly, I have been defunct these two years—and during all that time I haven't had a smoke! not a blessed draw! I miss my 'bacco dreadful. There is provision made for smokers, down with us, you will understand; but we are governed by a Board of Directors, whose incapacity quite equals that of most of your City Boards. There is a stock of bodies kept on purpose for smokers, so that, if you want a pipe, you must go into one of the bodies to enjoy it. But, if you will believe me, the supply is so notoriously insufficient to meet the demand, that there is no chance whatever for a new ghost to get a smoke. When I entered the Society, all the bodies were out in use, and booked for three years in advance. My name has been down on the books for two years, and there is no likelihood of my getting a body allotted me under another twelvemonth. Fancy two years without a smoke! Why, sir, the incompetence of our Board is positively wooden. I can only explain the reason why we put up with such gross mismanagement in the other world, because we have become so used to it in this. Our constitutions, however, are being undermined to that extent, that the Board has at last been coerced by popular feeling into passing a measure empowering ghosts to render themselves visible to single individuals at a time, in order that they may effect an exchange of bodies for short periods, always with the consent of the person in question, for the purpose of indulging in a habit which the directors "cannot, however, but characterise as pernicious and injurious." Under this new act I obtained your body.'

'You never had my consent, fiend!' I cried.

'It is vulgar to call names, my friend,' the ghost replied, smoothing my moustache with my fingers; 'but you are trifling. I asked you to *change places* with me, and you agreed, as you must be well aware.—But, dear me, here we are at Chelchester: however, I *must* finish my pipe—think of two years, and not a blessed draw, my friend!'

The train was pulling up. My companion leaned out of window, puffing fast and furious.

'Plenty of time to change bodies,' he said: 'it shall be done in an instant, as soon as the train stops.' And he continued leaning out, and whiffing away great clouds of smoke, till we came to the platform. He hurriedly knocked out the ashes of the tobacco on the door-rail, as the guard cried: 'Change here—change here; all change here, if you please.'

A sudden glow of warmth seemed to pass over me as I rubbed my eyes, and found, to my great delight, my own smooth hands against my very own unwrinkled cheeks. I looked up for my companion—he was gone—I was alone in the carriage.

I was greatly surprised, when I got on the platform, at being asked for my card by a very officious person; still more so, on receiving a magistrate's summons in the morning. The officious person deposed that he was the Secretary of the Anti-tobacco Alliance, and applied for a conviction against the undersigned, under one of the by-laws of the company, for smoking in a railway carriage, the property of the D. E. F. G. Company, contrary to their regulations. He declared to have seen me (only think!)—*me* leaning out of the carriage as it came into the Chelchester Station, smoking a meerschaum pipe! The guard gave evidence that the carriage certainly smelled very strongly of tobacco on arriving at Chelchester, and that I was the *only* first-class passenger. A meerschaum pipe, answering the officious person's description, was found on my person. Case was clear. Fined forty shillings and costs. Nay, more—the case of smoking in a railway carriage has been gibbeted at all the stations on the line—where I am hung up as a caution and warning to the British Public, in a solemn black frame, with my name and address, and the amount of the penalty enforced, at full length!

It would have been useless to attempt to dispute the case before the magistrates. It is something to have set one's-self right with the public.

AN OLD STORY.

Now is seen the kindly power
Of April sun and April shower;
Now the blade begins to shoot
From the wakened warmèd root.
Oh, how tender, yet how strong,
Is every little light-green tongue,
That, rustling in the rustling breeze,
Maketh chorus with the trees,
With birds and water, as they sing
That sweet as ever comes the Spring!
See, in soft grass interset,
The primrose and the violet,
The violet dark, the primrose bright,
But clinging close as day and night.
See, in the mead is springing up
The polished-yellow buttercup;
So thickly springing, that the wold
Shines like a tossing lake of gold.
The waterfall in changing flashes,
Now gold, now silver, downward dashes,
Till further on the stream anew
Runs on, a vein of brightest blue.
The air is filled with myriad notes,
Sent from a thousand little throats.
Above the general chirp is strong
The blackbird's and the thrush's song.
Spring's messenger, with loud ado,
Proclaims her with 'Cuckoo, cuckoo,
Cuckoo, cuckoo,' from yonder tree
In constant quaint monotony;
And with the rest we're fain to sing
That sweet as ever comes the Spring!

SAVAGES I HAVE KNOWN.

THE NEGRO.

My recollections of savagery on the Spanish Main are so numerous and so varied that I find myself really embarrassed in making a selection. In a certain sense of the word, nine in ten of the population between the Gulf of Mexico and the borders of Peru might be called savages, excepting here and there the dwellers in a little oasis of civilisation, such as Vera Cruz, Greytown, and Aspinwall on one coast, San Juan del Sur and Panama on the other. But it is of real barbarians I propose to treat, not of that very large class who may be conventionally so defined. Of such, then, there are three types noticeable in Spanish America —the Indian, commonest; the meztizo, or ladrone, the mixed blood; and the negro, exceedingly rare. I shall take the third of these for my first example.

All through Central America, from the States' frontier to the Panama Railway, exclusive of the population dwelling on the latter boundary, negroes of pure blood are not common. There never was any large proportion of slaves in that quarter of the world, except in Mexico and San Salvador; and, to their honour be it told, the very first act of these despised republics, when, in 1821, the blighting authority of Spain was overturned, declared slavery or peonage in any form opposed to the rights of man and the will of God. This act, however, though a just cause of pride to the people of Central America, was doubtless facilitated in its passage by the fact that very few persons were held in such bondage, and by the absence of any powerful interest hostile to it. From one reason or another, the negro seems not to have been regarded here with that antipathy commonly found in a white population brought closely into contact with him. His freedom proclaimed, he was immediately '*miscegenated*,' as the Yankees say; and though the marks of his blood are common enough among all classes of society, the thoroughbred African himself has become rare. On the Atlantic coast, indeed, are found a few small colonies of emigrants, creole blacks from St Thomas and Jamaica; and here and there is a settlement of that curious and interesting race, the Carib, of which people I am bound to declare that its males rival the Chinese in industry, and in honesty surpass all the world; while its females are so invariably chaste as to have given a proverb to the dissolute population, which their good example cannot shame into decency or good conduct. Whatever was the blood of these Caribs when deported, in 1796, to the island of St Vincent, by the English governor of Belize, they are now undistinguishable in any way from the pure negro stock, and the name of 'Carib' still clinging to them is obviously a false description. Nevertheless, they are not likely to surrender it, for that name now carries a dignity and repute more valuable than passports or testimonials. 'I Carib man, sah!' says a black fellow who comes for employment, standing upright before you, with a conscious pride of race and good name in his eyes; and if, on inquiry, his boast is found to be the truth, it only remains to settle wages and terms. A Carib's honesty and skill are among the self-evident verities of nature. But I must not dwell on this people, most interesting though it be, for not among such does one find a savage.

But Joe, or Joe'm, as he called himself, was undoubtedly a savage. Perhaps I ought to say something of my hero's birth and parentage, and I would with pleasure if I only knew anything. It is possible poor Joe had vague recollections of 'where his rude hut by the Niger lay,' but nobody seemed to care much about the matter, nor about any other sentimental feelings of Joe; indeed, summoning my memory to account, I am almost ashamed to find how very little I knew of the honest fellow in his capacity of individual. Joe was to me a realisation, an embodiment of the wood-spirit; he was more like to 'Man, the King of Animals,' than any shikari I ever met. To see Joe stalking through the dim aisles of forest, his

Digitized by Google

lithe figure, clad in flannel rags patched with fur, bending and swaying as though twisted with colic; his great feet treading noiselessly among rotten sticks and dry leaves; his eyes rolling round and round beneath ferocious brows; his thick lips twisting and twining all the while—to see Joe thus was to behold a somewhat startling apparition. But yet more impressive was my guide when his quick hearing thought to catch the 'chump, chump, chumping' of a wild boar's tusks against a tree-trunk, half a mile away. When that sound reached him, he paused suddenly, and his great shapeless ears literally erected themselves like those of a dog. He always leaned against a tree to listen, closed his eyes, opened his mouth, and, as one could see, concentrated every faculty of his strange mind on the one sense of hearing. His ears really moved. Then, if the distant sound proved to be no fancy, it was grand to watch Joe's stealthy action: no wild beast could move more silently, or with a keener instinct of the best approach. I was never tired of contemplating my guide, and to this intense admiration of Joe in his business capacity it is, I think, to be attributed that I inquired so little of his private life. My talks with him were almost exclusively of game and wild adventure. But beyond doubt, now that the question occurs to me, Joe must have had a local habitation, if not a home, somewhere. I put the home in doubt, because that sacred word implies the presence of a wife, or at least of woman in some capacity; and I chance to know that this indefatigable hunter had but a desolate hearth, wherever it might be, for I remember well a conversation I had with him on this subject.

He was telling me something of his history, as we sat upon a fallen cotton-tree. Joe's language was the most extraordinary patois I ever heard, and utterly impossible to be rendered; in mentioning that 'woman' was pronounced by him as 'wah'n,' with a strong aspirate, I shall give not the most curious example of his utterance. He had been telling me how he was born, no one knew where, in the interior of Africa: that he was captured, he didn't know why or by whom, and taken as a slave down to the coast: that he was there embarked, after an unknown time, aboard a ship of undiscovered nationality: that the ship was captured at sea, under circumstances of which he had not been able to get any explanation: that in process of time, by events entirely outside his control or knowledge, he had been landed at a spot which, since he left it, had been identified to him as Sierra Leone, or Sarah Leh'n, as Joe preferred to call it: that people 'had talked to him' there (here Joe evidently alluded to the missionaries): that he had been very happy, hunting in the woods and otherwise following his vocation, poor savage, until a gentleman of an unknown nationality had taken possession of him for unknown purposes and by unknown rights, and carried him to sea again, much to Joe's horror; for he had a wild-beast memory of anything that had been disagreeable or hurtful to him: that when a few days were passed, he was set to do tasks wholly opposed to his instincts, and was cruelly treated on failure: that, once more, he was rescued 'by an English captain, bless him!'—Joe began to know his friends and foes a little now, after an education of kicks and oaths!—and was landed, at his own request, in one of the West India isles, whence he had found his way to the mainland, where game is plentiful.

This was Joe's story—confused, inexplicable, a very chaos of incident unintelligible, but, in truth, the most pathetic tale ever I heard. To me, sitting, as is my wont from time to time, with the portrait of this poor fellow in hand, the blood seems suddenly to rise and boil at my heart, thinking of the story. I recall the broken sentences in which he told it—the rambling, muddled style; the down-trodden attitude he unconsciously assumed, as memory brought back those days of uncomprehended suffering. It was, I think, Joe's utter inability to understand why, how, where these things happened to him, which gave such a terrible pathos to the tale. He, made in God's image, a man most brave and true and kindly, had been buffeted about the world, with no more comprehension of cause or reason than has a dog; nay, not so much, for he knew not friends from foes. Untold, untellable suffering and misery surround us on every side; but civilised beings understand their woes, can explain them, and, if the chance come, rise out of them. But this poor negro, forced from his home, from all with whom he could communicate, thrust at one fell instant from his barbarous quietude beside some African river into our enlightened, civilised, horrible world, was as utterly lost and dumfoundered as though he had died by violence, and his soul had risen in another state of being. There is a tale of some chivalrous young Frenchman who so heated his indignant blood with the perusal of Spanish cruelties, that then and there he sallied out to avenge the crime of past generations on the offspring of the evil-doers. Such a wild impulse stirs in me sometimes as I think of poor Joe's wrongs.

However, it is not my hero's history I have to tell, but his character and tone of thought I would describe. We were sitting on the trunk of a cotton-tree, as aforesaid. 'Are you married, Joe?' I asked, between two bites of a 'tortilla.'

(Already I have announced my incapacity to render the negro's patois; I don't attempt it.) 'No, sir,' he answered. 'None of the "muchachas" will have me.'

'Why not?' I asked. 'You're tall and stout. There isn't a man on the country-side who can hunt like you; and the business is profitable.'

'Well, sir,' he said, 'I don't understand 'em. I'm nothing but a poor "nigger,"* and I don't know creole ways. There's a girl I was sidling up to, shop-maid at a store yonder, not more'n half black. We was friendly, and I give her peltries and 'pine quills' [porcupine quills], 'and she took 'em kindly. But says she to me one day: "What d'ye believe, Joe?" "'Most anything," I says, not knowing what she meant, you see. "D'ye believe in works?" she says. "Most sartin," I replies. "Or d'ye believe in election?" "That's what I believe," says I. "Not both?" she says. "No, not both!" says I. "Which, then?" says she. "Why, the other!" I says. So she called me bad names, in a way not fitting for a young girl speaking to a man. I held my tongue; and we parted.'

* 'Nigger,' among negroes, is a term of reproach applied to blacks of African birth, as opposed to those born in America or the islands. The latter call themselves 'creoles,' with the added name of their birthplace; Jamaica creoles, St Thomas, &c.

Digitized by Google

'But you 've tried again in another quarter?'

'Yes. I made out it was something they talk about in meeting-house that had set her off; this was in Greytown, of course. So I used to attend regular at the service there, and the minister was kind; like the folks at Sarah Leh'n he was.'

'Did you understand what he said?' I asked.

'No, sir. I 'm a poor nigger, and it was beyond me. He said we were to be good, which isn't Obi. I don't know what he meant by that. I asked Obi, and he told me the minister was right, whatever he said. So, after a while, I took up with a mnehacha as lives behind the cocoa-nut trees on the lagoon. I said to her: "My trust is in election." "What 's that?" she asks. "Election," I says. "What 's that?" says she. And I didn't know any more. "You 're a heretic!" she says a day or two afterwards. I didn't see what to answer, and so we dropped that acquaintance.'

These recollections seemed to affect poor Joe painfully. He sat leaning on his rifle, and grinding at the dank earth with its but, observing with great interest the circles thus formed.

'Well, and what next?' I asked.

'I lost heart for a long time, and hid myself all day and all night in the woods. I never made a better time of it than that. Pigs and deer were more plentiful than ever I found them, and I even met a jaguar—which isn't common, you know, by Greytown. At last I put down the river, with nigh upon a hundred dollars' worth of hides, and seven full quills of gold-dust that I 'd found in a creek. I met a young girl as fine as a quetzal bird, a stranger in Greytown—she was a washerwoman. After a week or so, I asked her to marry me, saying I was no heretic. "All right," says she. Somehow, I didn't like that. Says I: "About election?" I says. "Never you mind," says she. "And works?" I says. "You 've no call to trouble about that," says she sharp. I thought she was no better than I was myself, and left her. I 've not tried since. It seems as if there isn't no one in all this country as is suitable for a poor nigger!'

There were several points which struck me much in this little conversation, which I have not attempted to give textually, though preserving the *tone* as nearly as possible. First, it interested me to observe how entirely this savage possessed the instinctive sympathy—using the word in its strict sense—that distinguishes the creole negro. Though quite unconscious what was meant by the words of his first two loves, he had comprehended, by mere sympathy, that great importance attached to his answers, and that to ask what was meant by 'election,' 'heretic,' and so on, would be destructive to his chance. This quality of reading a person's mind when his words are utterly beyond understanding, is common with negroes, and, I think, is the secret of that liking which most tropical residents bear to them in the abstract. It is the same gift which an intelligent dog possesses in a less degree.

Another and more novel subject of reflection was the free use Joe made of Obi's name, that dire dissyllable which none willingly pronounce in the West Indies. When a blundering stranger, chokeful of questions and bits of half-knowledge, asks his host about Obi and his worshippers, there is loud laughter in the household—maybe laughter a little too loud. 'Obi, my dear sir!' repeats the host. 'There is no such thing among us, and never was—never. You have your bugbear for children in England, and we have our Obi here—the same idea under a different name. It 's enough to make one die of laughter to hear you English people take our Obi seriously. I might as well ask you "the truth" about the giant Cormoran, or the black man who frightens your children to bed.' So have respectable gentlemen expressed themselves to me who write. But long before Joe thus openly made allusions to the dread superstition, I knew how much to believe of the creole planter's eager denial.

Let Joe speak for himself and for his horrid faith. 'Do you say, Joe,' I asked, 'that the dreadful monster you call Obi commanded you to obey the Christian minister?'

'He always does so, sir,' Joe answered. 'Never Obi tell a man to go against the minister.'

'But you yourself said that Obi wasn't "good."'

Joe had no reply to this. He looked at me, and ground the but of his rifle into the soil. At length he repeated: 'Never Obi tell a man to go against the minister.'

On this I reflected for an instant. Joe's words explained in some degree a mystery that has perplexed very many persons who know the existence of Obi-ism, but cannot understand how a race so simply pious as is the negro—I speak of the *race*, mind—can reconcile the practice of a devilish superstition with the enthusiastic belief of evangelical Christianity. But Obi is equal to this difficulty. 'Never he tells a man to go against the minister.' But where the minister has not spoken, on doctrines and deeds the good man would shudder to contemplate, there Obi is master.

'You speak of consulting him. Does he live in the woods round here, and do you see him in the flesh?' I asked.

'I haven't seen Obi in the flesh these ten years: not since I landed at Greytown. Once I see him upon the Blue Mountains behind Kingston. There isn't an Obi in this part of America that I *know* of, sir.'

'Not an Obi? Are there several, then?' And on this I drew from Joe an explanation of the idolatry, most valuable and curious, I think, to those who feel an interest in the negro race. I would fain put into some order the facts he confusedly revealed.

'Obi' is not the name of a deity, as is the common belief. Comparative philologists connect the word with *ophis*, a snake, and deduce from this fact the most singular arguments. I cannot say how far the derivation may be correct; but if, as Joe declared to me, the Obi is *not* a deity, nor even an emanation, it is evident that much of the theory founded on this basis is incorrect. Obi, I learned, is but the title of a man—a man gifted with strange and magical powers, it is true, but simply a man. One is born Obi; no person can acquire the attributes or the title. The child so favoured is recognised almost at birth by his supernatural potency over men's minds. By whom he is swayed, or for what purpose the power is given him, no one investigates, or dares to inquire. The Obi is—the Obi! a terrible fact, a curse, seldom or never a blessing to his neighbours. It is a most important truth to be known, that Obi, all-powerful for evil, seems impotent for good—and by his own confession, he can kill, but he cannot generate life—he can curse, but not bless. The Obi is a solitary

Digitized by Google

being, a lover of caverns and deep forests, a feeder on strange meats, a hater of the light. From his seclusion he casts the darts of death, and never do they fail to strike. He dreads his own horrible faculty, and rolls upon the floor in speechless terror when summoned to do the work that men crave of him. But, whether unconscious agent or irresponsible, or no, Obi never fails. Pestilence is a weapon in his hand; dreams and apparitions are obedient to his will; all the baleful secrets of nature reveal themselves to his intuition—the deadly uses of herb and tree, and of animate and inanimate life.

I have but room for a very few of Joe's candid revelations. I choose those which may possibly explain in some degree the manner of Obi's working.

'How did you consult this fearful being, since he is as far away as the Blue Mountains?' I asked.

'Obi gave me a charm, which I wrap round my head at night, when I wish to see him. He never fails to appear in my dreams, and to tell me all I want to know.'

'Has he given you any other charms?'

'One—a hunting charm. I never miss when I have it on me, and never hit when without it.'

'Is it true that Obi delights in poisonings and frenzies?'

'I don't know. They say that if a man ask him for a poison or a philtre, he cannot refuse. I know nothing of that.'

'Most of the Obis are women, are they not?'

'No,' exclaimed the negro with contempt. 'Obi has more work than he can do, and therefore gives power, for a short time, to the fetich women. But when the time is past, they are no stronger than other people, only they know the poisons and medicines. Then they go about doing mischief, until they're caught and hanged by the magistrates, or thrown into a creek at night by the negroes. Obi's never caught, nor dare any one touch him.'

'Are there many Obis?'

'Only two in all Jamaica, and one of 'em's only a poor nigger, they say. But there's a plenty of your fetich women!'

So this savage discoursed to me sitting on a cotton-tree in the forest by the San Juan River. And the conclusion that rested on my mind, in regard to Obi, was this: if there be truth in mesmerism and electro-biology, there is the secret of his dreaded power; if there be not truth therein, then the trick of one is the trick of the other.

SPECTRUM ANALYSIS.

Within the last ten years, there has been made in physical science one of those extraordinary discoveries which almost revolutionise our knowledge of nature, and constitute a new era in scientific investigation. It has been found that luminous substances write down for us, as it were, their own chemical and physical nature and constitution, with an accuracy and delicacy almost surpassing the power of belief. The prismatic colours of the rainbow have been found to contain within them volumes which all the philosophers of the world cannot hope fully to read in centuries of time. No discovery of modern date can bear comparison with this spectrum analysis, as it is called, in regard of the extent and importance of the field it has opened to science.

It has long been known that if a beam of light be made to pass through a small triangular piece of glass, called a prism, the differently coloured rays of which it is composed will be separated from each other, so that if the light is afterwards received on a white screen or wall, the colours will be found to be spread out on the wall in the same order and proportionate breadth as is seen in the colours of the rainbow. This is owing to the fact that each ray is bent or deflected from its straight course in passing through the prism, and every separate ray to a different amount; those at the red end of this spectrum being bent least, and those at the violet end most. Early in this century, the well-known philosopher, Dr Wollaston, observed that if bright sunlight were thus received on a white screen in a very dark room, being admitted by a very narrow slit, a great number of dark lines were to be seen crossing the breadth of the spectrum, as many as fifteen thousand having since been counted. A German optician, Fraunhofer, subsequently described these lines more accurately, and found that they occupied invariably the same relative position in the length of the spectrum, so that he was able to mass and number them with great accuracy. Some of them were broad and distinct, and the most important of these were designated by various letters of the alphabet; others were very narrow and fine; some were single, others formed groups; but all were invariably the same in every particular, and in their relation to each other in position. It was further found that light from a white-hot solid body gave no dark lines at all, but presented a continuous spectrum, in which the colours were shaded into each other through every possible gradation. It had also been found that the vapours of various substances exercised an absorbing effect on the solar rays, the dark spaces caused by them being lines quite similar in character to the dark spaces in the solar spectrum, though the system of lines was different from that of the solar spectrum, every different substance producing, when vaporised, its own peculiar system of lines.

Another step was gained in another direction, and apparently without much bearing on this question of the significance of these dark lines. It was found by the German philosophers Kirchhoff and Bunsen that artificial light, produced by combustion—that is, by chemical combination—also gave a peculiar spectrum, and that of a most remarkable kind, shewing neither dark lines, like solar light and starlight, nor yet a continuous spectrum, like bodies in a state of incandescence without combustion, but a spectrum composed of a few bright lines, occupying definite positions in the spectrum field, or space where the solar spectrum would ordinarily be seen, and having colours accurately corresponding to the precise portion of the continuous spectrum which would be seen at the spot where they made their appearance. It had been well known, long before, that certain substances in burning tinged the flame with peculiar colours; but what the precise shades of colour were could not be told by the unaided eye, on account of the mixing together of various colours and shades.

Thus, it was well known that salts of sodium communicated a yellow colour to any flame in which they might be present; this being, indeed, the cause of the yellowness in the flame of all

Digitized by Google

our ordinary artificial lights. Salts of copper and of barium give a green tinge to flames in which they are present, and those of strontium give a crimson hue. This was well known; but it was not until the light from these and similar flames was analysed by the prism, that it was found that these colours, which could not be accurately distinguished by the eye, were nevertheless wholly distinct, being the result of the blending in the light of sets or systems of bright bands occurring in totally different portions of the spectrum field, and being composed, in fact, of rays differing in refrangibility and hue, but absolutely fixed and invariable for each separate source of artificial light. Thus, when sodium or its salts were submitted to this prismatic analysis, it was found that the spectrum produced consisted of a very strong bright line in the yellow portion of the field, and of this line only, this sodium spectrum being the simplest of all known spectra, though it is found on close examination with powerful instruments that the bright line is double, consisting of two very close together. The instruments used are in general two telescopes and the prism, which is placed between them, the light being condensed on the prism by one telescope, and the spectrum magnified after refraction by the other. A microscope, with the usual reflecting mirror, may also be used, being fitted with a micro-spectroscope containing the prism. If a powder, containing some easily volatilised metals, such as sodium, lithium, and thallium mixed together, is placed on a slip of platinum, and introduced into the flame of an ordinary Bunsen's burner, the light being then made to pass through a microscope thus fitted, the observer will see one bright line after another crossing the field of view, as one after another of the metals becomes sufficiently heated to pass into the gaseous condition. The spectrum of the alkaline metal lithium consists of two lines—a brilliant one in the red portion of the spectrum, and a weak one in the yellow. Both are sharply defined, and by this test the metal has been found to be present in the ash of muscular tissue and of blood. The red colour observed in strontium flames is similarly found to be due to the presence of six strongly marked red lines in its spectrum, which contains also, however, an orange and a blue line. The red line mentioned as belonging to lithium very nearly corresponds with one of these, but is distinguishable by its superior brilliancy.

Yet there seems to be some strange and mysterious connection between these two metals, some problem still unsolved in their relation to each other; for on one occasion, when Dr Tyndall was exhibiting at the Royal Institution the spectrum of lithium by means of the very high heat of the electric spark, a line not observed in the spectrum of this metal at the lower temperature of a gas-flame unexpectedly appeared, and this line was of a brilliant blue, like the blue line of strontium. This experiment was again and again repeated by different observers, and always with the same results. Professors Roscoe and Clifton at last compared the two spectra by placing one above the other in the spectroscope, and found, to their astonishment, that the blue lines accurately corresponded with each other; and not only so, but they found in both spectra two other faint blue lines, which had previously been unnoticed, and these lines also accurately coincided in the two spectra. We can hardly avoid the conclusion, that at the high heat produced by the electric spark, these two metals are decomposed into some simpler elements, one of which is common to each, and gives these coinciding blue lines.

The green tinge of barium flames is found to be due to several bright green lines in the barium spectrum; while the spectrum of calcium shews, amongst others, a single strong green and a single strong orange line. The spectrum of potassium has a continuous character, containing, however, two strongly marked lines—one in the red, and the other in the violet, the flame being tinged with a purple colour.

Four new metals have been added to our list by means of this method of chemical analysis, of which two are metals of the alkalies, thus making the number of known alkaline metals five. The two new members of the group are named rubidium and cæsium, so called from the peculiar characters of their spectra, rubidium having some red lines not seen in the potassium spectrum, and cæsium shewing two magnificent blue lines very close together. These metals are more strongly electro-positive even than potassium, but so closely resemble it in chemical properties that they had always hitherto been mistaken for it: they are found in many mineral waters, and in the ashes of several plants. The third new metal is thallium, found by Mr Crookes in the deposit in the flue of a pyrites burner, and named from its splendid single green line, and having chemical properties intermediate between lead and the alkalies. The fourth metal is indium, belonging to the chemical group which contains iron, and recognised in the spectrum analysis by its fine line in the violet.

If the permanent gases are highly heated, as by the passage through them of the electric spark, they also give spectra peculiar to each; thus, that of hydrogen has three lines—one bright red, one green, and one blue.

The accuracy with which the presence of a given substance may be predicated by this mode of analysis is greater than that afforded by any other chemical tests, as will be perceived on considering that some substances, such as iron, have a most complicated spectrum—as many as sixty lines or upwards, the presence of any one of which would, in most cases, be a satisfactory proof of the presence of the metal or other body; while that any two substances, distinguishable by other tests, should present identical spectra, seems, in the nature of probabilities, unlikely almost beyond the power of arithmetical expression, and, as regards observed fact, contrary to all analogy. Yet, the accuracy of this method of analysis is almost equalled by its delicacy: in the case of sodium, the presence of a quantity less than the $\frac{1}{100000000}$th of a grain can be demonstrated by this method; it is hereby found that the presence of sodium is so universal throughout the world as to be capable of recognition in every artificial flame, and a piece of wire shewn to be perfectly free from sodium is found to become covered with it by simply drawing it through the fingers; indeed, the mere exposure of any substance to the air for a moment causes it to give the sodium line in the spectrum.

While Messrs Kirchhoff and Bunsen were pursuing these researches on the luminous spectrum lines of different heated gases and vapours, and on

Digitized by Google

the absorbent effect of gases on rays of light coming from a more highly luminous source, it occurred to them to compare with each other the two forms of spectra thus produced—namely, the bright spectrum, containing dark absorption lines, produced by the passage of the light through some gas or vapour; and the dark spectrum-field, illuminated only by a few bright lines, produced by the same gas or vapour when brought to a highly heated and luminous condition. The bright and dark lines thus produced by the same element were found accurately to correspond. The great discovery of the nineteenth century burst upon them in its full splendour, fraught with results hardly to be imagined. The gases and vapours intercepted precisely the same rays, from a source of continuously coloured light, as they themselves emitted when brought by heat to the luminous condition; and, of course, the different elementary bodies revealed their presence alike by their own bright bands, and by their corresponding dark lines produced in a continuous spectrum. The inference was immediate and irresistible, that the dark lines in the solar spectrum were due to the presence of certain gaseous elements in the solar atmosphere, which absorbed portions of the continuously coloured or pure white light emitted by the solid bodies known as Nasmyth's willow-leaves. By comparing these dark lines with the bright bands of the elements when brought to a gaseous condition, it was now possible to determine what elementary bodies were present in a state of gas in the solar atmosphere. This is easily done by superposing the solar spectrum with its dark lines over the bright-line spectrum produced by one element after another; and the elements iron, magnesium, calcium, sodium, chromium, nickel, barium, copper, zinc, and hydrogen are thus found to be present in the solar atmosphere. That man should thus be able to analyse the atmosphere of the sun, placed at a distance of ninety-one millions of miles from us, with as much ease and certainty as he could analyse a measure of gas placed in his own laboratory, must surely be accounted one of the most wonderful results of science in any age.

Of course, it immediately became a matter of great interest to ascertain whether similar results could be obtained in the case of the fixed stars, and whether it would be possible to predicate the existence, in these distant suns, of the chemical elements familiar to us on our own globe. With powerful instruments, this was found to be quite possible. The spectra of the stars are found to be very different from each other and from that of the sun; but they reveal the presence of many elements well known to us as existing on our earth. Thus, the brilliant red star Aldebaran, in the constellation Taurus, has been found to contain hydrogen, antimony, bismuth, mercury, and some other elements similar to those of the sun. In Sirius, the most brilliant star in the heavens, only sodium, magnesium, and hydrogen can be certainly affirmed to exist. Two strongly marked violet lines in Sirius belong to some substance not known on our earth. Antimony, though found in Aldebaran, is a metal whose bright lines are wholly unrepresented by corresponding dark lines in the solar spectrum; and gold, lithium, &c. are in the same category. The star Betelgeux, which is the brightest of the two above Orion's belt, has a very deeply lined spectrum; sodium, magnesium, iron, copper, and several other metals are known to exist in it, but no hydrogen has been discovered. This is a yellow star. We may class stars as white, yellow, and deep-coloured. Sirius, Vega, Castor, and the greater number of minor stars, belong to the white class. The presence of hydrogen appears to be a marked characteristic of their spectra. The Sun and Arcturus belong to the yellow class. Betelgeux, Rigel, Mira, Albireo, Antares, Aldebaran, and many others belong to the third class, some of which are red, and others blue. α Hercules and β Pegasi, both of which belong to this class, have very remarkable spectra, shewing the appearance of a multitude of bright flutings separated by wide black bands: this must indicate that their atmospheres are charged with a great multitude of vapours belonging to many different substances. The colours of the stars depend, of course, on the character of the vapours in their atmospheres: if the atmosphere of a star absorbs a great deal of the violet end of the spectrum, and therefore shews many black lines towards that end, the star will have a red colour; if there are many black lines towards the red end, the star will have a blue colour; if the absorption is pretty evenly spread throughout the spectrum, the star will be white; yellow will result from a good deal of absorption at both ends, the middle being less affected. Stars of the same type are generally found a good deal grouped together. Orion abounds in stars of a green colour; white stars are found about the Pleiades and the Bear; yellow stars about the Whale.

Some stars give bright lines instead of dark ones, but these are very rare—β Lyræ and γ Cassiopeiæ do so, and some small stars in the Swan. This indicates, of course, that actual combustion is going on in these stars, whereas the ordinary black lines indicate an atmosphere of vapour surrounding incandescent material. A very remarkable instance of bright lines occurred in a star that suddenly became very bright in May 1866. This was a telescopic star in the Crown, which, in the course of a couple of hours, attained the brightness of a star of the third magnitude. It was first observed by Mr Birmingham at Tuam, in Ireland; a celebrated astronomer, Dr Schmidt of Athens, had been observing the same spot in the heavens about three hours before Mr Birmingham, and had observed nothing remarkable. Astronomical *savans* immediately turned their attention to the star, which, however, only continued bright for two or three days, and then faded away to its original size. In the meantime, however, Mr Huggins had turned his powerful spectroscope upon it, and had found out that it was nothing less than a world on fire, its brilliancy being due to the combustion of hydrogen with some unknown element. This was exhibited in the spectroscope by the presence of the bright lines of hydrogen along with some other bright lines, which have not been produced by any element on our earth. Several instances are on record of unknown stars suddenly blazing out in this way, and then soon fading away again.

It naturally followed that, after the stars, the nebulæ should be submitted to spectroscopic examination. These, as is well known, are faint fleecy cloud-like masses, most of them extremely minute, which stud the heavens in great numbers. Most of them are quite telescopic, but some are easily recognisable by the naked eye, such as the great

Digitized by Google

nebula in the sword of Orion, lying between the two stars which, along with it, seem to hang down from the belt; the great nebula in Andromeda; and the nebula in Hercules, which is, however, much more difficult than either of the former to detect with the naked eye, although we ourselves have constantly made it out on clear nights. Though some are thus visible to the naked eye, nothing can be said to have been known of the nebulæ till after the invention of the telescope. This instrument has revealed hundreds of these beautiful objects, and exhibited their extraordinary structure. We have them ring-shaped, dumb-bell shaped, crab-shaped, and of all irregular forms. Under the high power and vast light-gathering capacity of Sir W. Herschel's four-foot reflector, many of them were found to consist of a vast congeries of stars, and hence have been considered to be star systems like the Milky-way, the star system to which our sun belongs. The distance of these systems has been supposed to be such that thousands of years must be spent ere their light travels to us. When examined by the spectroscope, they are found to have continuous spectra, doubtless because the dark lines produced by one star composing them will be illuminated by the light of another star in which the elements are absent to which the dark lines of the former were owing. The great nebula in Andromeda, spoken of above, is an instance of this kind of nebula. But some of these mysterious objects proved intractable to the highest powers Sir W. Herschel could apply; the great nebula in the sword of Orion was of this sort; it is seen as a misty cloud surrounding several bright star-like points known as 'the trapezium.' Lord Rosse tried it with his great reflector, and thought that some portions of it shewed signs of approaching resolution into stars—that is, looked as if a better instrument would shew that it was composed of stars. In his telescope it formed a most beautiful object, branching out in streamers in all directions, and extending much farther into space than had formerly been supposed. But Mr Huggins turned his spectroscope upon it, and found that instead of being composed of stars, it consists of gaseous matter; in fact, that it is a true nebula, and not a star system. The spectrum was not continuous, like that of the nebula in Andromeda, nor did it exhibit dark lines, like the stars, but three bright lines only; shewing that it was composed of gases in a state of incandescence. One of these bright lines belongs to nitrogen, another to hydrogen, and the third to some unknown substance; two of them are in the green, and one, that of the hydrogen, known as F, in the blue. The same result has been presented by most of the other true nebulæ, so that it cannot be any longer doubted that the sagacious conjecture of Sir W. Herschel was right, that these are systems in process of condensation from a gaseous into a liquid, and subsequently, doubtless, a solid condition—a change which Laplace conjectured, and no doubt with reason, to have taken place long ages back, in the case of our sun and solar system.

Mr Huggins has recently arrived at another result of extreme interest in connection with his spectroscopic observations of the stars, and this is, that by the aid of this instrument we can estimate the motion of the stars towards or from the earth, and the rate of such motion. We shall endeavour to explain the principle on which this astonishing discovery is based. It has long since been satisfactorily proved that light is, like sound, due to an extremely rapid succession of minute waves, which, occurring in the luminiferous ether, strike the eye, and become appreciated by it as light. It is also well known that, as in the case of sound, an increase in the rapidity with which the waves of air strike the ear is attended by a sharpening of the note sounded, while a decrease of this rapidity is attended by a flattening of the note; so in the case of light, the more rapid the vibrations of the luminiferous ether, the more the colour approaches to that seen at the violet end of the spectrum; and the slower the vibrations, the more it approaches to that seen at the red end. Now, it was suggested by Doppler, and proved by Ballot, that in accordance with this fact, changes could be artificially produced in the pitch of the same note as appreciated by the ear, that the ear could be made to hear the same note artificially sharpened or flattened. The mode Ballot adopted of experimentally proving this interesting point was as follows: he placed musicians upon rapidly moving trains, and desired them to sound continuously the same note, while they passed by other musicians stationed beside the line, to listen to this note. He thus employed the most delicate test known for the estimation of the varying or unvarying rate of rapidity of the waves of sound—namely, the trained musical ear. The result obtained was in perfect accordance with the theory—namely, that while the trains were advancing, the note sounded was heard sharpened, or, as it is called, higher than it sounded to the ear of the musician who produced it; while the self-same note, as the train receded, was heard flattened, or lower than it really was; the waves of sound being evidently shortened in the first case, and lengthened in the last, in the same proportion, compared with their natural or normal length, as the speed of the train bore to the rate at which sound travels. Obviously, the same result must hold in the case of light; but light travels with such enormous speed, that no artificial change could affect it in any appreciable degree. The rates of motion of the heavenly bodies might, however, bear some appreciable proportion to the speed of light, and this was the question which Mr Huggins proceeded experimentally to try; and the result was successful; but it put the highest powers of his finest instruments to the very utmost test. The apparatus he used produced a dispersion of light—that is, a lengthening, or rather widening out of the spectrum, equal to that produced by seven prisms of 60 degrees of dense flint glass. Now, it is clear that the eye would be wholly unable to appreciate any difference in the shade of colour produced in bright lines, as from nebulæ, in consequence of their being moved slightly towards one or other end of the spectrum, as a result of changes in the rapidity of the light-producing vibrations; but the position of the dark absorption lines from a star being accurately measured with fine micrometers, might perhaps exhibit a slight deviation towards one or the other end of the spectrum, according as the luminous body might be moving from us or towards us. And this was found to be the case, to the extent of about the two-hundred-and-fiftieth part of an inch. Of course, if the experiment were tried with only a single line, any alteration, however slight, might imply only a new substance in the star's

Digitized by Google

atmosphere; but when the same change is found to affect every line proceeding from a star, and always in the same direction, and in the same proportion, the inference is irresistible that the change is due to the motion of the luminous body. The light of Sirius, when thus tested, was found to be slightly degraded—that is, its refrangibility was lowered; or, in other words, all the dark lines were shifted towards the red end of the spectrum; shewing that the vibrations come to us somewhat lengthened, or made slower, than they ought to be; and thus establishing the fact that the star is moving away from us. The result arrived at by measurement of the amount of this degradation of the light is, that Sirius and the Earth are becoming removed from each other at the rate of forty-one miles in a second of time, of which twelve miles per second was due, at the time of observation, to the Earth's motion in the same direction as the rays of light, leaving twenty-nine miles a second as the actual rate of recession of the star from us. Many other interesting facts have been arrived at by the application of this wonderful instrument of research; but the above may suffice to explain the nature of these investigations, and illustrate the results arrived at.

ABOARD THE SEA-MEW.

IN TWENTY-TWO CHAPTERS.—CHAPTER VIII.

It was a rush, and no mistake; for they had been priming themselves up with rum, I should think, for the last hour or two, till they were nearly mad; and with Van at their head, they came on, yelling like so many devils, more than Englishmen, though certainly half of them were from all parts of the world. There was no time then for thinking, and before you knew where you were it was give and take.

We fired as they came on; but I did not see that much harm was done, only one chap falling; while, as they returned it, Mr Wallace gave a cry, and clapped his hand to his shoulder, dropping at the same time his cutlash, which Tomtit laid hold of, for he had just shied his pistol, after firing it, right at Van's head, only missing him by half an inch or so.

Van dashed right at the skipper like a cat, and with one cut sent him down, when he turned upon me, to serve me the same; but I was too quick for him, and as I jumped aside, his cutlash hit the bulkhead and snapped in two. I believe it would have gone hard with him then, for that carver was sharp, and my old blood was up, but in the struggle I was driven back; and the next thing I saw was Mr Ward drive that skewer of his right through one fellow's shoulder, and then starting back, he fired three shots from his revolver, but with what effect I never saw, for two of the piratical rascals were at me, and it was all I could do to keep them at a distance. I fetched one a chop across the back of the hand at last, though, and sent him off howling and cursing; and then managing to avoid a cut, and sending my arm out, I caught the other right in the chest, and down he went like a stone; when, to my surprise, I found it was only the buckhorn handle I had hit him with, the blade having flown out, and gone goodness knows where.

There was no time to choose who should be your next enemy, for two or three were at you directly, and there I was at last, fighting best way I could with my fists, driven here and there with the planks slippery with blood, and men, some wounded, some only stunned, lying about for you to fall over.

I kept casting an eye at Mr Ward, and could see that he was fighting like a hero; but all at once I made a jump to get at him, for I saw Van creep up behind, while he was defending himself from a big fellow with a cutlash, and though I shouted to him, it was of no use, for the poor young fellow was cut down just as I turned dizzy from being fetched down with a crack from a marline-spike.

CHAPTER IX.

When I came to again, my head was aching awfully, and I found myself lying upon the deck, with old Sam Brown dabbing my forehead with a wet swab. Close aside me was Bill Smith, and the sight of him alive did me so much good that I jumped up into a sitting position, and gave his hand a good shake. But, there, it was for all the world like having boiling lead poured from one side to the other of your head, and I was glad to lean against the bulkhead again.

There were half-a-dozen of the crew keeping watch over us, while Sam whispered to me that six bodies had been shoved out of the port—three being passengers; as to the rest on our side, Mr Ward's seemed the worst wound, but he, poor fellow, was sitting up pale and anxious, with his handkerchief tied round his head, and evidently, like me, wondering what was to happen next.

I could not help noticing soon after how well the women bore it all; hushing and chattering to the children to keep them quiet, and doing all they could to keep them from noticing our wild and wounded faces. They were all huddled together in the big cabin, while, with the exception of the men on guard, the mutineers were on deck. From the slight rolling of the ship, it seemed that they had altered her course; but my head was too much worried and confused for me to notice much, and that day slipped by, and the night came—such a night as, I pray God, I may never again pass; for the cabin-hatches were closed upon us, and none of the men staid down, but after serving round some biscuit and water, and some rank bad butter at the bottom of one of the little tubs, they went on deck, though we soon found that a couple of them kept watch.

It was a sad night and a bitter, for as soon as darkness came down upon us, the poor women, who had held up so well all day, broke down, and you could hear the smothered sobbing and wailing, till it went through you like a knife. I believe they tried all they could to keep it in, poor things; but then 'taint in 'em, you know, to keep up long; and then when the children broke out too, and wanted all sorts of things that they couldn't have, why, it was awful. We had no lights, for they wouldn't give us any, so we all had to set to, to try and make the best of everything; but we couldn't, you see, not even second best, try how we would.

'Only a bit of a cut, sir,' I says to Mr Ward, who was going round and doing what he could in the dark for we chaps as had got knocked about. 'I shan't hurt. See to Bill Smith here. Tell you what it is though, sir—you won't ketch me at sea again in such a Noah's Ark as this here.'

'Hush! my man,' he says, 'and try all you can

Digitized by Google

to help.' 'In course I will, sir,' I says; and then, hearing a growl on my right, I says: 'That ain't Bill, sir, that 's Sam. He 's all right: nobody can't hurt him, his blessed head 's too thick.' Directly after the doctor felt his way to Bill Smith, and tied up his head a bit, while I was wondering what to do for the best, listening all the time to women wailing, and little ones letting go, as if with the full belief that they 'd got the whole of the trouble in the ship on their precious little heads. What seemed the best thing to do was to quiet some of them; and if it had been daylight, a sight or two of my phiz would have frightened 'em into peace; but how to do it now, I didn't know. 'Howsoever, here goes for a try,' I says; and I groped my way along as well as I could, expecting every moment to be deafened, when I turned half-mad with rage, for some one yells down the skylight: 'Stop that noise!' and at the same moment there was a pistol fired right into the wailing crowd; then there was a sharp clear shriek, and directly after a stillness that was awful.

'It was a cruel cowardly act,' I heard some one say then close to me; 'but, Miss Bell'—— And then directly came the young lady's voice saying: 'It is almost as cowardly, sir, to speak to me in this way, when I am so unprotected.'

'By your leave,' I says gruffly, and I felt a little hand laid on my arm.

'Is that you, Mr Roberts?' says Miss Bell, and I could feel her soft breath on my cheek.

'It 's old Tom Roberts, without the Mister, ma'am,' I says, 'and at your service. What shall I do?'

What could I do? Rum question, wasn't it? When, if she didn't put a little toddling thing into my arms—a bit of a two-year-older, as was just beginning to cry again, after the fright of the pistol; but I turned myself into a sort of cradle, got rocking about, and if the soft round little thing didn't go off fast asleep, and breathe as reg'lar as so much clock-work!

'Well done you, Tom Roberts,' I says, after listening to it for about half an hour; and do you know, I did feel a bit proud of what I 'd done, being the first time, you see, that I 'd ever tried to do such a thing; and so through the night I sat there with my back to the bulkhead, and with my head all worried like, for now it was me groaning, and now it seemed that I was crying like a child, and then people were telling me to be quiet, only I wouldn't, for I had mutinied, and was going to kill Mr Ward, and marry Miss Bell, and things were all mixed together, and strange and misty, and then thicker still, and at last all was blank, and I must have gone off to sleep, in spite of my trouble, for when I opened my eyes, it was broad daylight again, and then the first thing they lit on was a little chubby, curly-headed thing in my lap, watching me as serious as could be, and twisting its little hand in mine.

I hadn't eyes for anything else for a little while, but as soon as I did take a look round, all the troubles seemed to come back with a jump, for most of the party were asleep: there they all were, first-class passengers and steerage passengers, all huddled together, no distinctions now. Old Sam was snoring away close alongside of the skipper and Mr Wallace, and strange and bad they looked, poor fellows; while up at the far end sat Miss Bell, bending over her brother, who lay on a locker; but whether she was asleep or not, I couldn't tell.

But there was something else took my attention, and that was, that though all the other berths seemed empty, one had some one lying in it, and that berth I could not keep my eyes off, for it got to be somehow mixed up with the firing of that pistol down the skylight and the sharp cry I had heard; and so from thinking about it all, I got it put together in a shape which Mr Ward afterwards told me was quite right, for a little lad of nine years old was killed by that cowardly bullet, and it was him as I saw lying in the berth.

By degrees, first one and then another of our miserable party roused up with a sigh, and then sat staring about in a most hopeless way; all but Mr Ward, who went round to those who had been wounded, saying a cheering word or two, as well as seeing to their bandages; but it was quite by force that he had to do the skipper's, for his wound had made him light-headed, and he took it into his poor cloudy brain that Mr Ward was Van, and wanted to make an end of him.

People soon got whispering together and wondering what was to be done next, for they seemed to be busy on deck, and of course we were all very anxious to know; but when Sam Brown got a tub on one of the tables, and then hauled himself up, to have a look through the skylight, he came down again rubbing his knuckles and swearing, for one of the watch had given him a tap with a marline-spike; and after that, of course no one tried to make out.

I, for one, expected that they would have taken advantage of having their own way to have a reg'lar turn at the spirits; but no: they certainly got some up, but Van seemed to be driving them all with a tightish hand, so that they were going on very quietly and reg'larly, as we found, for by-and-by they serves out biscuit and butter and fresh water again; and not very long after, Van sung out down the hatchway for me to come up; and knowing that if I didn't go he 'd send and fetch me, I went up, and sat down on the deck, where he pointed with a pistol. Then he ordered up Sam and Bill, and four sailors who were on our side (lads only), and the skipper and Mr Wallace, one at a time, till we were all set in a row, with them guarding us; when, with his teeth glistening, Van walks up to the skipper, and hits him on the head with the but-end of his pistol, so that the poor fellow fell back on the deck.

'Set him up again,' says Van savagely; and a couple of the mutineers did so, but only for Van to knock him down once more; and he did that four times over, till, when they set the poor captain up again the last time, he fell back upon the deck of himself, being stunned like. It was enough to make any fellow burst with rage; but what can you do when there 's half a score standing over you with loaded pistols? and, besides, trouble makes people very selfish, while we all knew how Van was having his bit of revenge, cowardly as it was, for the way the captain had treated him.

Last of all, Van goes and puts his foot on the skipper's neck, and I made as though to get up, for I thought he was going to blow his brains out; and bad and cowardly as the captain had been, I couldn't a-bear to see him hit when he was down without trying to help him; but it was of no use, for I was pulled back directly, and all I could do was to sit and look on.

All at once, Van turns a breaker on its end,

Digitized by Google

jumps on it, and, sticking his arms a-kimbo like a fishwoman, he begins to spout at us; and fine and fierce no doubt he thought he looked in his red nightcap, and belt stuck full of pistols. 'Now, my lads,' he says, 'we're going to have some of the good old times over again: take possession of one of the beautiful isles in the P'cific, and sail where we like under the black flag, free as the day, with none of your cursed tyrants to make men sweat blood and work like dogs, but all free and equal. We've done the work, and captured the ship, and you've acted like thieves and curs, and sided with them as will be ready to kick you for your pains. As for you, Wallace, curse you! you have always been a cur and a tool; but we shall want help, and you can come if you like; while, you others, we'll look over what's gone by, for you did fight like men. So, what do you say?—will you join us, or take your chance to reach land in one of the boats with the lot below?'

The young lads all looked at me, to see what I'd say, for no one took much notice of Mr Wallace. Bill Smith, too, who was much better, he looks at me; and I s'pose old Sam meant to do the same, but when I turned to him, all I could make out was the whites of his eyes, till he turned his head on one side, and I got a sight of one eye, when he turned his head t'other way, and then I see t'other.

It was very plain that they meant me to be spokesman; and seeing that was to be the case, and that, after a fashion, they left me to decide, I just turns it over in my own mind for a bit, and seeing as I should be wanted in the boats to help make the land somewhere, as they was to be loaded with a set of the helplessest beings as ever breathed—why, I says: 'T'others can do as they like; as for me, you never asked me at first; and as you've done without me so far, why, you can do without me now—till you gets to the gallows,' I added, but so as they couldn't hear me. And, though I hardly expected it from the lads, they said they'd do as I did; while, as for Bill and Sam, they always was a pair of the helplessest babies as ever breathed, and left me to think for 'em ever since we first sailed together—indeed, I don't fancy as Sam ever had any thinking machinery at all. Howsoever, they said as they'd stick by me; and Van gave a curse and a swear, and a blow or two at us; and then, after a bit of 'scussion, in which women was named two or three times, and Van and another party was quite at loggerheads for a bit, he gave his orders, big and bounceable like, and telling us to lend a hand, he made ready to lower down one of the boats.

CHAPTER X.

Two boats were lowered down, and my two mates and me and the four sailors was to man 'em. They let down Captain Harness, wounded and half-mad as he was, into one boat, and Mr Wallace the mate into the other; and then a couple of compasses, and some breakers of water, a bag or two of biscuit, and a tub of butter were lowered down. Then came the job of getting the passengers into the boats. The men were ordered up first, and, some wounded, some savage, some weak and disheartened, they were made to take their places, some of the mutineers keeping guard with cocked pistols and drawn cutlashes. I believe, though, in spite of their weapons, that a little English pluck was all that was needed to save the ship; but no attempt was made, and, trembling and frightened, the women and children were ordered up, and then the boats were loaded.

'Now, then, down with you, and shove off,' says Van Haigh, shewing his cursed white teeth, and pricking at poor Sam Brown with his cutlash, just out of malice like. And you should have seen Sam's eyes that time! He never spoke, but it's my opinion if he'd had the chance, he'd have shaken Van's precious body until the ear-rings he was so proud of had dropped out of his yellow ears. But, as I said before, Sam didn't speak; he only lays hold of the side-rope, and lowers himself into the boat, already too full; Bill Smith dropping into the other, in spite of his wound.

'Now you!' roars Van to me, for I was standing hesitating, and I don't mind saying that a cold chill ran all through me, for just then I heard the click, click of his pistol cock, and I knew he was taking aim at me. But I mastered myself, and wouldn't turn round; for it was an important time, and there was much to think about. There was poor Mr Ward, with his head bound up, held by two of the mutineers; and poor Tomtit, with his knees to his chin as he sat upon the deck; and of course they weren't going, for the boats wouldn't hold any more. And there was the fat passenger, as cried when we left home; and last of all, Miss Bell and her brother below.

It didn't take me long to make up my mind, for it seemed to me as it would never do for me and my mates to go and leave them in their trouble, for maybe they'd be sent afloat in a little boat next, and wouldn't know how to work her; so, half-expecting every moment to drop with a bullet through me, I says: 'I'm blest, my lads, if I ain't had about enough of it. While the old skipper was aboard, I did my duty by him and them as was under him; but now there's a new skipper, I don't see what call there is for me to go afloat with a set o' lubbers in a crazy boat. You, Bill Smith, and you, squinty Brown, can do as you like.—Captain Van,' I says, turning to him, 'if you'll shove that pistol away, I'll stop aboard.'

'Hooray!' shouts half-a-dozen of the fellows; and I could see Van looking me through and through with them dark eyes of his; but I don't think he got much below the skin either, and besides, he was a bit tickled by me calling him 'captain;' so he puts the pistol in his belt, and the next minute Bill and Sam was aboard again, looking half-puzzled like, while the mutineers gave a bit of a cheer, and the passengers groaned at us; and, to make matters right with them on board, I jumps on the taffrail and groans again, and calls the poor beggars swabs—God forgive me!—for shoving off in so lubberly a way, with their oars dipping anyhow, nohow, one after the other in the water, and the boats not trimmed. It was a cruel trick, but I meant it all for the best; while, what to do about old Sam, I didn't know, for he was growling and swearing to himself like some old tiger-cat, and I was afraid he'd shew his teeth and claws every moment; but he kept quiet. And as for Bill, he seemed misty and dazed, never speaking, but sitting down on the deck to lean his head against the side. Then Van seemed more at rest, for, giving his orders, the men uncocked their pistols, after making-believe to blow the fat chap's brains out, and making the perspiration run down

Digitized by Google

his face, mixed up with tears, for he began to pipe his eye terribly.

'Lower 'em below,' says Van; and the fat passenger saved 'em the trouble; while, when they were letting down Tomtit, whose hands were tied, and they were going to let go, they found his legs was already at the bottom, and then his head disappeared, but only to pop up again the next moment like a Jack-in-the-box, to see what was going to be done to the doctor.

'Ain't he a rum beggar?' I says to one of the bloodthirsty devils at my side, all to make friends, you see; and he laughed, and so did two or three more, for another of 'em made a cut at the poor chap's head with his cutlash, to make him bob down the hatchway again, which he did, though only to come up again, till, finding it wasn't safe, he kept down, and we didn't see him no more just then. The poor doctor was the next to take their attention; and, seeing how cut up the poor fellow was, I 'd have given something to have gone and shaken hands with him, and told him what I felt, and at first I hardly dare look him in the face.

They lashed Mr Ward's hands behind him, and I saw his lips quiver as he kept on casting an eye at the cabin stairs. I knew well enough what he was thinking about, only I daren't look at him much, for there were plenty watching me suspiciously enough; and, let alone not wanting to be knocked on the head, I felt that to do any good for the passengers, I must throw them as had the upper hand off the scent.

I was leaning against the bulwarks, making-believe to look on, cool as could be, and screwing my old mahogany phizog into what I meant to be a grin of delight at our freedom, but I know it must have been about the sort of screw that a fellow would give when lashed to a gun for a round dozen.

Mr Ward saw me grinning, and sent such a look at me as made my face grow as long as a spoon; but that wouldn't do, and I daren't give him any signal, so I laughed it off, and, pulling out my box and opening my knife, I goes up to him, and I says in a free-and-easy way: 'Have a chaw, mate?' and made-believe to cut him one.

'You infernal traitorous scoundrel!' he shouted, and in spite of his lashings he made at me; while, making-believe to have my monkey up, I up with my knife and made a stroke at him, sending it through his pilot-coat and into one of the side-pockets, dragging at it, to get it out again, and keeping it hitched the while, till some of them laid hold of me by the arm, when, struggling and swearing, I hit out with my left hand, and caught Mr Ward upon the chest, sending him down upon the deck, when I tried again to get at him, but they held me fast.

'I 'll let him know,' I spluttered out; and then Brassey, Van's right-hand man, gives the order, and three of his mates drags Mr Ward down the hatchway; when I pretended to be better, and only kept on muttering and scowling about like a dog that 's lost his bone, till ten minutes after, when I got a pannikin of grog, and sat looking at what was going on.

CHAPTER XI.

I don't think I 'd any plans made; my only idea was, that when they sent the three or four others off, me and my mates might seize another boat, and row after them, the same night, for they wouldn't get very far, as I knew, unless a fresh breeze sprung up, and took us away. Certainly the two boats that had gone were loaded deep, but they were not making a mile an hour; and it seemed plain enough to me that unless they could answer for its being calm till the poor wretches were picked up, if they ever were, the brutes on board had murdered 'em one and all, men, women, and children, by a slow kind of torture.

'Not very smart crews, matey,' I says, pointing with my knife over my shoulder to where the boats were slowly rising and falling, and then I fished out a piece of chicken from a tin case of the skipper's, and went on eating away as if I hadn't a care on my mind. 'Pig away, my lads,' I says to Bill and Sam; but Bill couldn't touch a snap. Sam made up for it, though; and after plenty of hard work and fighting, and two days on biscuit and water, and that rank yellow grease sailors get for butter, one's teeth do get rather sharp. 'Now, if you 'll just sarve another tot o' grog round, cap'n,' I says to Van, as I wiped my knife on the leg of my trousers, 'I shall be about done and ready for work.'

Some of the fellows laughed, and Van said something about my not being such a bad sort after all; but I could see as he did not trust me, which, I must say, was quite right, and the only right thing as I ever saw in the blackguard's character.

I soon found that though they 'd all doubled the Cape a good many times, there wasn't a man with navigation enough in him to tell where we were, or how to carry the ship on her course; while, though I don't believe I could have worked a reckoning right, yet, somehow or other, I fancy I could have shoved that old ship's nose into the harbour for which we were bound. Their plan seemed to be to crack on due south till we 'd got high enough, and then to steer west, and get into the P'cific best way we could. I give them my bit of advice when it was asked, for I thought that the more we were in the track of ships, the more likely we were to be overhauled; but they would not have it my way; and Van giving his orders, a lot of us sprung up to make sail. When lying out on the main-royal yard, I run my eye round and quite jumped again, for, bearing down towards where the boats were crawling along, there was a bark with every stitch of canvas set.

Sam saw it too, for he grunted; but I give him a kick, and down we came, our vessel feeling the breeze now, and careening over as the water began to rattle under her bows.

I felt more comfortable after that; for though I did not for a moment think that the ship I had seen would overhaul us, still I felt pretty sure that she 'd pick up those poor creatures in the boats, and save them from a horrible death. There was no doubt about having seen the bark, but from the deck never a glimpse was got of it; and we went bowling along in capital style, just, in fact, as if we had been a honest ship on a good cruise.

Having nothing particular to do, I went below, and the first place I came to was the cabin that had been fitted up for Mr Butterwell's birds; and on getting to 'em, there they were, poor little things, fluttering and chirping about with their feathers all rough, for they 'd got no water and seed. Quite a score of 'em were lying dead in the bottom amongst the sand; and after giving the

Digitized by Google

pretty little things water, and seed, and paste, I fished out the dead ones in a quiet, methodical sort of way, turning over something in my mind that I couldn't get to fit, when I feels a hand on my shoulder.

'Going to wring their necks?' says Van, for it was him come down to watch me.

'Not I,' I says. 'They'll do first-rate to turn out on the island we stops at. Sing like fun.'

'Look ye here, Roberts,' he says, 'we're playing a dangerous game, and you've joined us in it. Don't play any tricks, or'—— He didn't say any more, but looked hard at me.

'Tricks!' I grumbled out; 'I'm not for playing anything. I'm for real earnest, and no favour to nobody.'

'I only said don't,' says Van; and he went up again.

'A suspicious hound,' I says to myself; and then I began to turn over in my own mind what I had been thinking of before; and then having, as I thought, hit upon a bright idea, I hugged it up, and began to rub it a little more shiny.

You see what I wanted to do was to get a word with Mr Ward, and how to do it was the question. I knew well enough that I should be watched pretty closely, and any attempt at speaking would be put an end to most likely with a bullet.

I rubbed that thought about no end, and next morning I goes to one particular cage where there was a linnet that I had seen Mr Butterwell play all sorts of tricks with; and instead of feeding it, I quietly took out the panting little thing, carried it on deck, got up in a corner under the bulwarks, and waited my time, watching the while to see if any one had an eye on me. Then I let the bird go; and it flitted here and flitted there with a tiny bit of paper fastened under its wing, till, as I had hoped, there came from out of the cabin skylight a particular sort of chirrup, when the bird settled on the glass for a moment, and then dropped through the opening where it had been broken.

Now, on that bit of paper I had printed what I knew wouldn't hurt me if the bird was seen by the mutineers, for I was afraid to say much the first time; and as I had written on it, 'Let him go again,' so sure enough up he came ten minutes after, and watching my chance, I followed him about till I caught him, and took him back to his cage, and gave him plenty of seed.

Van had taken possession of the cabin next to where his prisoners were, and the skylight being partly over his place, a word with Mr Ward was out of the question; while such a little messenger as I had found would go to his master when called, perhaps without calling, specially after him fortunate enough to catch sight of the bird the first time I tried.

All that day matters went on as usual, a strict watch being kept over the prisoners, and more than one as I fancied having an eye to me. On and on we sailed due south, and the weather kept wonderful all the time; but there seemed no sign of starting the rest of the passengers off in a boat, and I began to feel worried and troubled about their fate, and more anxious to get on with the plans I was contriving.

CHAPTER XII.

Now, not being a scholar, I had a deal of trouble over the note I got ready for the next morning, for, you see, I wanted to say very much in a very little room, and in a way that shouldn't betray me if it was to fall into the wrong hands. It was meant for Mr Ward, but I knew Tomtit would get it; but that didn't matter, as they were fellow-prisoners, and what I wanted was to put the doctor on his guard, and also to let him know that all I'd done was so as to be alongside of him and Miss Bell. So I says in the note:

'HONOURED SIR—Lay yourself well to the wind, and haul every sheet taut. Them as you thought was sharks a shewing their teeth warn't only shams. Take all you gets, and clap 'em under hatches, and, whatever you do, don't be deceived by false colours, nor hail ships as seems enemies.'

'There,' I says to myself, when I'd got that printed out careful, 'if he can't make that out, he can't understand nothing;' for, I put it to you, what could I have said clearer, and yet made so as no one else could understand? It seemed to me that I'd just hit the mark, and the next thing was to get it to him.

Who'd ever have thought, I says, that that long doubling-up chap, as we all made such fun of with his little birds, would have turned in so useful; and then I got what you big people call moralising about everybody having their use on earth, without it was mutineers, whose only use seemed to me to be finding work for the hangman.

I got no chance to send my note that day, through people being about; next day, too, nothing came of it; but early the next morning, soon after daybreak, I got my little messenger out, tied the paper to his wing with a bit of worsted out of my kit, and then going on deck, I let him fly; but so as not to take the attention of the chap at the wheel, I started him from up in the main-top, where I made-believe to have gone to have a smoke.

There was a watch of three forward, but they were all half asleep; while as for him taking his trick at the wheel, he kept on nodding over his job, and letting the ship yaw about till she went anyhow.

Bless the pretty little thing! When I first opened my hand, it only sat there looking at me with its bright beady eyes, and then it was so tame, it hopped upon my shoulder, to stay a few seconds, before flitting from rope to sheet and shroud, lower and lower, till it perched upon the cabin skylight, and rattled out a few clear crisp notes, like a challenge to its master, who, I felt sure, would be asleep. My only hope was that the little thing would flit through the big hole I made, and stay in the cabin till Tomtit was up.

But I was wrong, for the bird had no sooner sung its sweet note, putting one in mind of old boyish days when we used to go bird-nesting, than I saw a hand thrust up through the broken light, and after a little fluttering, the bird let itself be caught, when, knowing that my job was done, I came slowly down, and walking aft, stood and talked to the chap at the wheel.

'Hollo!' I says, all at once, 'there's one o' my birds got loose;' and running forward, and making a good deal of fuss, I captured the little linnet, for it never flew far at a time, having been tamed and petted by Mr Butterwell till it was almost like a little Christian.

That day I watched my chance, and got hold of what powder I could, making a little packet of it

Digitized by Google

in my silk neckercher; and when it was dark, I managed to drop that through the skylight as I went whistling along the deck. Next thing to be done was to get some weapons, for it seemed strange to me if we six true men couldn't somehow make one chance and turn the tables on the rascals who had taken the ship. Counting them up, I found there was about seventeen—long odds enough, unless we could trap half of 'em, and fight 'em a part at a time. Then I thought the odds would be fair, for fighting with right on our side, I considered that we were quite as strong as eight of the others.

But the job was to get hold of weapons, for they never let neither me, nor Sam, nor Bill Smith have neither cutlash nor pistol, only take our turn at the wheel, or trim sails, otherwise we were treated right enough. Some of the chaps grumbled, saying, that now Van had made hisself captain, times were as hard as they were before; but that wasn't the case, though now he'd got the ship, he didn't mean to lose her again if he could help it, and seemed to me to be always on the watch for everything. As to trusting either of we three to go down below with rations, that was out of the question, either he or Brassey attending to that, and more than once I heard high words, and Mr Bell talking in a threatening way when Van was below.

Now, if it had been at any other time, we should not have sailed a hundred miles without being boarded by some one; while, if a Queen's ship would only have overhauled us now, it would have been salvation for us: but no; day after day slipped by, and not a sail came near. All I had managed to drop more into the cabin was only a couple of table-knives; when one dark evening, as I lay under the bulwark, hid by a bit of sail, I saw Van come out of his cabin, go and talk to the chap at the wheel, see to the coursing of the ship, and then go forward. I heard him talk to the watch for a minute, and then he went below forward, when, running upon all-fours, I was at the cabin hatch and down below in a jiffy.

As I expected, there were plenty of pistols and cutlashes there, where he had had them put for safety; and if I could have opened the big cabin door, I might have pitched half a score in before any one could have said 'Jack Robinson;' but there was something to stop me, for I had crossed the room and had my hand on a cutlash before I knew that Brassey was in the cabin with his head down upon the table, and seemingly fast asleep.

I should think I stood there with my hand stretched out for a full minute, not daring to move, expecting every moment that Van would come back, or else that Brassey would wake up.

That minute seemed to be stretched out into quite an hour; and then feeling that it was now or never, I shoved one after the other six pistols inside my shirt, when taking another step to reach where some swords stood together in a corner, I knocked one down, when I threw myself on my hands and knees, so that, if Brassey started up, he would not see me at first. Then as I lay there trembling with anxiety, I heard him yawn, push the lamp a little further on the table, and a minute after, he was snoring loud.

I waited as long as I dared, and then rising lightly, I got hold of one cutlash, and then of five more, out of a good twenty as stood there; stuffed as many cartridges out of the arm-chest into my pockets as they would hold; and then, after doing all this by fits and starts, expecting every moment that Brassey would hear me, I turned to go.

I 'd crept across the cabin, and reached the door, when I heard a step on the deck, and drew back; but the next moment it had gone, and after waiting for a minute, with the cutlashes tightly held under my arm, I made another start, when my heart seemed to sink, for I heard a sort of husky cough I well knew, and Van had his foot upon the stairs.

There was only one way for safety, and that I snatched at, for in another few seconds Van would have had me by the throat, and all would have been over; but, darting back, I laid hold of the lamp, dashed it down upon the sleeping man's head, and then leaped aside.

MEDIEVAL BOOKBINDING.

The Egyptians, as every one knows, wrote on the papyrus, a kind of rush, growing in the swamps adjacent to the Nile, strips of which were fastened together till the required breadth of surface was obtained. A great deal of this was required, for copies on papyrus of the funeral ritual were placed in every mummy-case. To make the paper, the Egyptians cut off the two extremities of the stalk, slit it, and peeled off the skins. These were placed one above another transversely, and stuck together by the water of the Nile; and finally, beaten with a mallet, and polished by a tooth or shell. When required to last long, they rubbed it with oil of cedar. The botanical name for the papyrus is *Cyperus antiquorum*, and it is called *berd* by the modern Egyptians. It grows to the height of about ten feet, surmounted by a downy flower. On monuments of the reign of Chephren and Cheops, men are represented bearing bundles of this plant.

According to Varro, before the time of Alexander the Great, the Greeks used palm-leaves, linen, or wax. Papyri were exported from Egypt; but the trade was stopped by the rivalry of the kings of Egypt and Pergamus. Ptolemy Philadelphus, king of Egypt, prohibited the exportation of the papyrus, in order to prevent Eumenes of Pergamus increasing his library; but the latter caused the skins of sheep to be dressed and used for writing upon; this was called *pergamena*, hence *pergament* and *parchment*. *Biblos* was a kind of bark used for books in Greece, as well as papyrus and *liber*. The inner bark of the lime was used in Italy for the purpose. We get our word *book* from the Danish *boek*, beech-bark, on which writings were made at an early period. The Roman books up to the time of Augustus were in the form of scrolls (*volumina*), wound round a stick named *umbilicus*, the extremities of which, richly ornamented, were the *cornua*. The outside of these *volumina* were often of appropriate colour to the subject treated of in the roll; thus, those relating to war were *red;* to voyages, *blue;* &c. The manuscripts of the rolled-up form dug up at Herculaneum and Pompeii have no trace of decoration. In some instances the Romans used leaves of lead, which had been beaten thin with a hammer, and also leaves of wood covered with wax, connected at

Digitized by Google

the back with rings. Books of this kind have been found at Herculaneum, and may be considered the rude original of the modern book.

Martial, in his *Epigrams*, tells us that works could be had in an elegant case or *binding* for five denarii (about three shillings of our money). He says it took only *one* hour to copy the whole of his second book of *Epigrams*. Respecting the cheapness of books then, we must remember that slaves executed vast numbers, and their food only cost twopence-halfpenny per day of our money. Horace allowed his slaves a pound of a kind of common corn, a little wine, oil, and salt. Mr Humphreys says that a rapid writer was able in less than twelve hours to produce a copy of a poem equal in extent to Tennyson's *Enoch Arden* and its accompanying poems. The square form of book began to prevail in Rome, in imitation of tablets. These tablets were afterwards made of leaves of vellum, and the covers of ivory were richly embellished. Square books began to be generally adopted in the fourth century. A copy of Virgil in the Vatican in this form has been assigned to the reign of Septimius Severus. The Romans had superb libraries, adorned with portraits of deceased *literati*, with cases reaching to the roof, called *loculamenta*, with shelves and holes for the rolls. The number of books destroyed in the Alexandrian Library was about five hundred thousand volumes. Josephus refers to a copy of the Law sent to Ptolemy Philadelphus, which was written in letters of gold upon skins so artfully put together that the joinings did not appear.

In the middle ages, the libraries were much smaller. Before the year 1300, the library of the university of Oxford consisted only of a few tracts, chained or kept in chests in the choir of St Mary's Church. At Glastonbury, in 1248, there were only four hundred volumes, and that was the first monastery in England. In 1364, the Royal Library of France did not exceed twenty volumes. When the Abbot of Gambleurs had collected one hundred volumes, he imagined he had a fine library. The monastery of St Serfan, an island in Loch Leven (Kinross-shire), possessed only sixteen books, and yet the prior, Andrew Wintoun, in 1420, completed his *Orygynale Cronykil of Scotland*, a valuable specimen of ancient manners. The finest library we read of in the fifteenth century was that of Corvinus, king of Hungary (died 1490), who had thirty thousand volumes, a great many of which were bound in brocade, with bosses and clasps of gold and silver.

It seems extraordinary that with the difficulties the monks had to contend with, they should have produced masterpieces of illumination, which we cannot equal, much less excel. 'If you want a rubber,' says an old treatise on Illumination, 'you must take a dogge's toothe, and set him in a sticke.' They made their own brushes from minever tails, set in quills, or often perhaps from the hair of the conventual tom-cat. They extracted their colours from plants and minerals, which the lay brethren ground; and made the vellum from the skins of animals slaughtered for their food. It is certain that in the eleventh and twelfth centuries the skins were prepared in the monasteries, and the process is described by Archbishop Hildebert of Tours in his sermon on the *Book of Life*. But this parchment was not equal to that supposed to have been imported from the Moors in Spain. In the fourteenth and fifteenth centuries, it was bought in its manufactured state, as the monastic rolls of accounts testify. Generally, in a volume, one set of scribes wrote the work, and the illuminators added the initial letters, &c. But it is on record that Henry, a monk of the Abbey of Clyde, in 1178, wrote and illuminated a volume, and even made the brass bosses of the binding with his own hands. When finished, the volume was bound generally between two boards covered with skins, or richly ornamented with plates of gold and silver set with crystals and rubies. Ecclesiastics were forbidden to hunt, but Charlemagne granted permission to priests to indulge in the pleasures of the chase if they did so to procure deer-skins for binding their books.

The Book of the Gospels, or Text, was generally bound in the most sumptuous manner, and decorated with the symbols of the four evangelists. An example, in the Vatican, containing the Gospels of St Luke and St John in golden letters, is covered on one side with a leaf of ivory, artificially wrought with carved work, in which is seen a figure in a toga, holding in the left hand a book, with the right in benediction: it is supposed to be of the time of Charlemagne. The same emperor gave to the monastery of Arrianse a Text, the covers of which were enriched with amber and carved ivory. Lothaire, king of France, in 855 offered to the monastery church of Pruyan, where he embraced the religious life, 'a Book of the Gospels in ivory covers, inlaid with gold, and set with crystals and jewels.' The early Irish manuscripts were often splendidly adorned, as well as the silver *cumdhacks* or cases in which they were contained. Ethenwolf, in a metrical epistle to Egbert, at that time resident in Ireland for the purpose of collecting manuscripts, extols one Ultan, an Irish monk, for his talent in adorning books. In Anglo-Saxon and Irish bindings a piece of crystal or beryl is made their chief ornament. In some instances, this piece of crystal (usually shaped into a convexed oval) is of so large size as to take up the whole side of the cover, and readily suggests the propriety of calling it a 'glass book' (*Archæologia*, vii. 167). Dr Rock thinks this custom was derived from the Druids. The term 'æstel' employed in King Alfred's translation of Pope Gregory's *Liber Pastoralis*, was probably this boss of crystal: 'To every bishop's see in my kingdom I will that one (of the copies of his own Anglo-Saxon translation of the Pastoral) be sent; and upon each there is an *æstel* which is about fifty mancuses (in value), and I bid, in God's name, that nobody that æstel from these books shall undo.' The Durham Book, or St Cuthbert's Gospels, in the British Museum, is surpassed only by the celebrated Book of Kells, that exquisite example of early Irish art. Bishop Eadfrith, successor to St Cuthbert, caused the book to be illuminated to his memory. It was encased in a splendid binding of gold, set with precious stones, by Bilfrid, an anchorite at Tyninghame, in East Lothian, the most skilful binder in Northumbria. St Dunstan was very celebrated for the beautiful manner in which he bound books. In the Stowe Catalogue, the ancient silver binding of the celebrated Irish Service-book is figured. In *The Church of Our Fathers*, by Dr Rock (279, 287), a notice will be found on the style of bookbinding among the Anglo-Saxons. St Margaret, queen of Scotland, one of the last of the Anglo-Saxon

Digitized by Google

princesses, bestowed a cover glistening with gems on her highly illuminated copy of the Four Gospels. The volume was interleaved with fine glossy silk, such as may sometimes be met with even now between the leaves of later illuminated manuscripts. In Dugdale's *History of St Paul's*, we find mention made of eleven Texts or Books of the Gospels, all richly bound, belonging to that cathedral. The texts were placed in shrines (*camisiæ*) often of silver and gold. Salisbury Cathedral had (1222) a Text bound in solid gold, ornamented with twenty sapphires, six emeralds, eight topazes, eight alemandine stones, eight garnets, and twelve pearls. In the year 1315, Canterbury reckoned as many as seven Texts, bound in gold and precious stones (Dart's *Cant. Cath.*, App. p. 7). A fine specimen of this style of binding in silver parcel-gilt, formerly belonging to Dr Butler of Shrewsbury, is now in the British Museum.

Alcuin, an industrious English monk, occupied himself from 778 to 800 A.D., that is, twenty-two years, in making a copy of the Bible for Charlemagne. This was afterwards purchased by the British Museum for L.750.

Of course, bound in this way, and artistically illuminated, these books were the most valuable gifts a monastery could offer a prince; and in the opening page of the volume, we often see a representation of the author presenting his book to the king or nobleman. Thus, in *The Shrewsbury Book* in the British Museum, Talbot, Earl of Shrewsbury, is presenting his book to Henry VI., who is seated on his throne, and surrounded by his courtiers. Richard de Bury, Bishop of Durham (1333–45), was a great bibliomaniac. He bought of the Abbot of St Albans a Terence, a Virgil, a Quintilian, and a sermon against Rufinus, together with thirty-two other volumes, for fifty pounds of silver. In the reign of Edward III., one hundred marks (or one thousand pounds) were paid to Isabella de Lancaster, a nun of Ambresbury, for a book of romance purchased from her for the king's use. The richest covers were sometimes made double, so that when a secret spring was touched, the outside boards opened, and displayed the inward magnificence. Eleanor, Duchess of Gloucester, mentions, in her will in 1399, 'a chronicle of France in French, with two clasps of silver enamelled with the arms of Burgoyne; a book containing the Psalter, Primer, and other devotions, with two clasps of gold enamelled with the arms of France; and a Psalter richly illuminated, with the clasps enamelled with white swans, and the arms of my lord and father enamelled on the clasps.' In the accounts of the wardrobe of Edward IV., we find that Piers Banduyn was paid for 'binding, gilding, and dressing' two books twenty shillings each, and sixteen shillings each for four others. Now, twenty shillings then would be twenty pounds of our money. He also had six yards of velvet, six of silk, with tassels, gilt clasps, and nails supplied to him. The British Museum gave seven hundred pounds for a missal and case of Italian work, *c.* 1580, ornamented with rubies, emeralds, and azure enamel, supposed to have belonged to Henrietta Maria, queen of Charles I.

Libraries were often kept in towers, for superior seclusion, in early periods. The books were arranged on the shelves with the edges outside. In *Noontide Leisure* (i. 38, 39), we read: 'This room [at New Place], which Shakspeare called his own, had, together with an eastern aspect, a pleasant look-out into the garden, and was very neatly fitted up in the Gothic style with carved oaken presses, well stored with books, of which the leaves, and not the backs, being placed in front, and these decorated with silken strings, and occasionally with gold and silver clasps, in order to confine the sides of the covers, not only contrasted well with the dark hue of the oak, but gave a light and cheerful appearance to the apartment.'

Shakspeare says:

> That book in many 's eyes doth share the glory,
> That in gold clasps locks in the golden story.

Bishop Earle, in his *Microcosmography*, says of a young gentleman of the university: 'His study has commonly handsome shelves, and books neat silk strings, which he shews to his father's man, and is loath to untie or take down, for fear of misplacing.'

In the frontispiece to Dr Boys' *Works* (Lond. 1623, folio), the author is represented in his study with his books ranged on the shelves, with the edges frontwise. We frequently meet with vellum and parchment-covered volumes in which the vellum overlapped the edges, and the title was written on one of the flaps. But with other books it must have been difficult to find any volume wanted. Sometimes the title was written across the leaves in large letters.

In a book preserved by the town of Southampton (a code of naval legislation, in Norman-French, *c.* 1320), one of the oak boards in which it is bound is much longer than the other, and has a square hole in the lower part, to put the hand through, in order to hold it up while citing the laws in court. In the fifteenth century, books of prayers were often bound thus: the leathern covering of the volume was lengthened beyond the margin of the boards, and then gathered into a large knot at the end; it could then be hung at the girdle. A wood-cut of this arrangement will be found in the second volume of *The Book of Days*, page 339.

In the monasteries, an officer called the 'armarian' had charge of the books. He was expected to see that they were not injured by damp or insects, and especially to look after the bindings; he had also to keep a correct catalogue of them. Ingulphus, of the Abbey of Croyland, speaking of the lending of books, says: 'Our books, as well the smaller unbound volumes as the larger ones which are bound, we altogether forbid.' The scriptorium at St Edmundsbury was endowed with two mills. In Archbishop's Lanfranc's Constitutions (1072), we find an injunction ordering that at the beginning of Lent the librarian was to deliver a book to each of the religious, which was not to be returned till the following Lent; and all who had neglected to read the books were commanded to prostrate themselves before the abbot, to supplicate his indulgence.

The old stamped leather bindings of the fifteenth and sixteenth centuries are often beautifully executed, and exceedingly interesting. Jean Grolier, Viscount d'Aguisi, one of the four treasurers of France (born at Lyon 1479, died 1565), collected a magnificent library, and had the books splendidly bound. In 1675, his library was dispersed. Gascon, the celebrated binder of that time, was chiefly employed by Grolier, but the designs are

Digitized by Google

said to have been composed by himself in moments of leisure. A wood-cut of one of these bindings will be found in Shaw's *Decorative Arts, Ecc. and Civil, of the Middle Ages.* It had the usual inscription: '*Io grolierii et amicorvm,*' indicating that it was for the use of his friends as well as himself. The collection of Mr Edwards was very rich in these volumes, and large prices were realised. A coloured plate of great beauty will be found in Shaw's work, of a book belonging to the same style and period, though it cannot be proved to have belonged to the Chevalier Jean Grolier. Aldus, the famous printer of Venice, printed the works of Machiavelli in 1540, in four volumes. Grolier had his copy bound in four different patterns, and one volume was sold at the Libri sale for one hundred and fifty pounds. At the same sale, two volumes, which formerly belonged to the library of Diana of Poitiers, beautifully bound, were sold for eighty and eighty-five pounds respectively. The celebrated artist, 'le petit Bernard,' is said to have been employed on them. At the library at Treves is a manuscript studded with heads wrought in fine cameos.

In the middle of the sixteenth century, leaves of paper were pasted together for bindings, wood having been previously used for the purpose. Mr Thoms says the originator of binding in cloth was Mr R. E. Lawson, of Stanhope Street, Blackfriars, formerly in the employ of Mr Charles Sully; and the first book bound in cloth was a manuscript volume of music, which was subsequently purchased by Mr Alfred Herbert, the marine artist. On the volume being shewn to the late Mr Pickering, who was at that time (1823) printing a diamond edition of 'the classics,' he thought this material would be admirably adapted for the covers of the work. The cloth was purchased at the corner of Wilderness Row, St John's Street, and five hundred copies of the Diamond Classics were covered by Mr Lawson with cloth. Shakspeare's plays were also issued in this form, and these works were the first books bound in cloth.

The custom of chaining books to desks in churches is said to have originated from an act of Convocation in 1562, ordering that Nowell's Catechism, the Articles, and Bishop Jewell's Apology should be taught in universities and cathedral churches. But the custom has been traced back as far as Sir Thomas Lyttleton, who, by his will, dated 1481, ordered some of his works to be chained in different churches. St Bernard, in 1153, in one of his sermons, actually alludes to some such custom.

It is probable that there was no specimen of velvet binding before the fourteenth century. In the will of Lady Fitzhugh, *c.* 1427, several books are bequeathed: 'I wyl that my son Robert a Sautre covered with rede velvet, and my doghter Mariory a Primer cou'ed in rede, and my doghter Darcy a Sauter cou'ed in bleu, and my doghter Mal de Eure a Prim'r cou'ed in bleu.' Queen Elizabeth had a little volume of Prayers bound in solid gold suspended by a chain at her side. The Countess of Wilton, in her *Art of Needlework*, says the earliest specimen of needlework binding remaining in the British Museum is Fichetus (Guil.) Rhetoricum, Libri tres (Impr. in Membranis), 4to, Paris ad Sorbonæ, 1471. It is covered with crimson satin, on which is wrought with the needle a coat of arms, a lion rampant in gold thread in a blue field, with a transverse badge in scarlet silk: the minor ornaments are all wrought in fine gold thread. The next in date in the same collection is a description of the Holy Land, in French, written in Henry VII.'s time. It is bound in rich maroon velvet, with the royal arms, the garter and motto embroidered in blue; the ground crimson; and the fleurs-de-lis, leopards, and letters of the motto in gold thread. A coronet of gold thread is inwrought with pearls, the roses at the corners are in red silk and gold. In the Bodleian Library is a volume of the Epistles of St Paul (black-letter), the binding of which is embroidered by Queen Elizabeth; round the borders are Latin sentences, &c. Archbishop Parker's *De Antiquitate Britannicæ Ecclesiæ* (1572), in the British Museum, is richly bound in green velvet, embroidered with animals and flowers, in green, crimson, lilac, and yellow silk, and gold thread. In the same collection is a Bible bound for James II., shewing on the cover his initials, J. R., surmounted by a crown, and surrounded with borders of laurel, the four corners being filled with cherubim.

The writer of this paper once saw at Broomfield, in Essex, a Bible which belonged to Charles I. (date 1529, Norton and Bell printers). It is a folio, bound in purple velvet; the arms of England richly embroidered in raised work on both sides, and on the fly-leaf is written: 'This Bible was King Charles the First's; afterwards it was my grandfather's, Patrick Young, Esq., who was library-keeper to his Majesty; now given to the church at Broomfield by me, Sarah Attwood, Aug. 4th 1723.' It is a relic little known.

Various kinds of insects, popularly called bookworms, do much injury to books. A mite (*Acarus eruditus*) eats the paste that fastens the paper over the edges of the binding, and loosens it. The caterpillar of another little moth takes its station in damp old books, between the leaves, and there commits great ravages. The little boring woodbeetle also attacks books, and will even pierce through several volumes. Mr W. R. Tymms mentions an instance of twenty-seven folio volumes being perforated in a straight line by the same insect, in such a manner, that by passing a cord through the perfectly round hole made by it, the twenty-seven volumes could be raised at once.

A TWILIGHT PICTURE.

'Tis a sweet Sabbath eve in summer-time,
And lovers twain, with hand enclasped in hand,
Upon a flower-hemmed meadow-pathway stand,
Beside a stile they care not yet to climb.
Before them spread fair uplands crowned with pine,
That, sharply on the amber sky defined,
Stand up black-green against it; while behind,
A wood's dark edge with strongly pencilled line
Curves round a hill. Fair is the sylvan scene,
And oh! so sweet the tender twilight hour—
So sweet, and yet so sad. A silvery sheen
Falls like an after-thought on leaf and flower;
And such deep calm abounds, the very air
Breathes low and faint, like one engaged in prayer.

DRAWN FROM THE LIFE.

MR JOHN STOTT'S DIFFICULTY.

Less than forty years ago, in a certain west-country town of England, lived Mr John Stott, head of the constabulary, so astute a thief-catcher, that his friends thought it a pity he should throw his wits away upon provincial vagabonds, and not give them broad and noble scope as a Bow Street runner. His enemies, the local scoundrels, thought the same; but contented themselves with observing darkly that 'he was so sharp that he would one day probably cut himself,' or that 'he was too clever to live.' In spite of these intellectual advantages, or in consequence of them, Mr Stott was as vain as a peacock, and made the not uncommon mistake of imagining himself even a cleverer fellow than he really was. He kept the little town (for it was a little one then) so clear of evil-doers, and got so complimented thereupon by the bench of magistrates, that he could not conceive that any misdemeanour could be committed which his sagacity should be unable to ferret out, or should fail to bring it home to the true culprit. 'I don't pretend for to say,' was one of his favourite remarks, 'as I was *never* puzzled in my profession, but this I *will* say, as no man ever took me in *twice*;' and then he would resume his pipe with the air of a man who has modestly confessed to a weakness, which no other person would have dreamed of attributing to him. Even his wife believed in Mr John Stott, and so doubtless would his *valet de chambre*, if he had happened to have kept one.

'Burglary at Sir Robert Air's last night,' said he sententiously, as he sat smoking after supper in his snug little parlour, one summer evening, while his wife mixed his gin-punch after his own particular receipt.

'You have got the wretches, of course,' observed Mrs Stott, paring the lemon-peel so that you could see through it, 'or else it would not be my John.'

'Well, no,' returned the great man, rightly appropriating the last observation as a compliment rather than an expression of doubt as to his personal identity. 'The fact is, it 's very queer; but I have *not* got the wretches. I shall have them to-morrow, but at present they are absolutely at large.'

'Lor, John! I can scarcely believe you when you tell me. Why, how on earth could they have got away from you? They could not have been ordinary burglars.'

'You are right, ma'am,' returned the chief-constable, with a gratified look; 'you have hit the nail exactly on the head. They were not ordinary men: they were acrobats.'

'Acrobats!' answered Mrs Stott softly; 'dear me!'

She had no very accurate idea what 'acrobats' were; they might be a religious sect, or they might be a savage tribe, or possibly even both. But she had long passed for a woman of sense and sagacity, through maintaining a discreet silence, except when her husband's talents seemed to demand her eulogies, and she was not going to risk that reputation now. She had a full share of the curiosity of her sex, but she had more than their ordinary patience. She waited to be informed upon the subject in question, without hazarding the remark which occurred to her, that acrobats had white hair and pink eyes, and therefore could at least be easily recognised by the constabulary; and she had not to wait long.

'Yes, it must have been them Tumblers,' mused Mr Stott, sipping his punch out of the teaspoon; 'and less than three and the boy could never have done it. It was her Ladyship's dressing-room window, as looks out on the back, as they broke in at, and no ladder could have been put there because of the flower-stand. It must have been that little devil in the tights and spangles at top of the three others. I have measured the height from the ground, and it just tallies. That 's what comes of allowing them itinerants to be in the place at all. The idea of the mayor letting them have the Town-hall to shew their tricks in! I'd

Digitized by Google

put a stop to everything of that sort, if I had my way: and I will do it too, in future.'

'But you will not interfere with Mr Shaw, John, I do hope, since he has been so pleasant and civil.'

'No, ma'am, no. Mr Shaw is a man of science, in his line, and what is more, a man of substance. Mr Shaw's exhibition is itinerant, it is true, but that is from the necessity of the case. His collection of wild animals is interesting in a high degree, as the rector was observing to me only yesterday. But them acrobats is quite another matter. However, lissom as they are, they must run a little faster, and climb a little higher, I can promise them, before they can get out of the reach of John Stott.'

'They stood upon one another's shoulders, and the boy clambered up them, I suppose?'

'Yes, ma'am, that was their ingenious method; and if they had had to do with a common mind—though I say it who should not say it—the manner in which the thing was done would have remained a mystery. If a ladder had been used, it must needs have made some mark upon the mignonette-box. My men were all agape when I stated that circumstance, and began looking up in the air, as though some bird had done it. But, of course, when I said "Them Tumblers!" they saw everything clear enough. Sir Robert, who assisted our investigations in person, was so good as to say that I reminded him of Christopher Columbus and his egg.'

'You don't say so!' said Mrs Stott admiringly, and wondering within herself what that story was, and whether Mr Christopher Columbus could possibly have been an oviparous animal. 'And did her Ladyship lose much?'

'Some rings and pins, and three or four pounds in gold. Curiously enough, there was a bundle of bank-notes upon the dressing-table which entirely escaped the young rogue's attention, or her loss would have been much more serious.'

'And yet, he was such a frank-faced, honest-looking little fellow, that I never should have thought harm of him,' said good-natured Mrs Stott; 'but of course you 're right.'

'Well, most probably,' observed her lord and master with a short dry chuckle. 'By ten o'clock to-morrow morning, when the justices meet, we shall have this honest-looking young gentleman and his friends in the Town-hall, taking part in a public performance of another kind than that with which they favoured the town last week. And then we shall see what we shall see.'

Mr Stott arose, took his official hat down from its peg, and prepared to go his rounds, a nightly precaution he seldom omitted, notwithstanding the absence of all native criminals from his strictly preserved territory; as for the acrobats, they had fled with the first dawn of morning, and were not likely to return till they were brought back; but he had despatched two of his small 'force' in pursuit of them, and hence there was the more need for his personal vigilance.

'I shall be back at two, as usual, my dear, if not before,' said Mr John Stott.

About two A.M., from long habit, the wife of the chief-constable was accustomed to awake, and presently to hear her husband's heavy footfall coming up the stairs; but upon the present occasion there was no such welcome sound. She sat up in bed with her nightcap tucked behind her ears, and listened attentively, but in vain, for him. Notwithstanding his precarious calling, Mr Stott was a model of punctuality, and as Time (which in her opinion was almost the only thing that could do it) went on without him, she began to be seriously alarmed lest this admirable man, whom human ingenuity had never yet baffled, had been overwhelmed by envious Fate. There had been thunder in the air that night, and a bolt might have struck him. But at daylight she heard the front-door open, and a slow tread come up the stairs. The wife of a chief-constable should be above the suspicion of trepidation, but it was so unlike his ordinary step, that it made her heart go pitapat. However, it *was* her husband, whose noble spirit something had evidently cast down. Instead of kicking his boots across the room as usual, he drew them off, and then sat in his stockings, thinking.

'John,' said she, in much confusion and alarm; 'what *is* the matter, my dear? Have you not caught them albatrosses?—I mean albinos.'

'Yes, ma'am, *they*'re safe enough. But the deuce of it is that—in their absence—there has been another burglary. Mrs Colonel Peewit's house has been broken into just in the same way—through the second-floor back window. It 's nothing less than magic, for *that* had a mignonette-box, and there is no mark of a ladder to be found there neither. I 've had my bull's-eye over every square inch of it.'

'Lor, John!'

'There was nobody in the room,' went on the chief-constable musing, 'and the window was open, so that the thing might have been done easy enough, when he had once got there. But how he ever *did* get there—that 's the question—unless the devil had wings.'

'But the devil *has* wings!' was Mrs Stott's involuntary exclamation; the good lady was so flustered by her late anxiety, that for once she spoke in a hurry.

'You will presently cause me to imagine that I have made a *second* mistake in my life, ma'am—in the having married a fool,' was her husband's stern rejoinder. Then he went on soliloquising. 'The thief, whoever he was, took the same things—rings and pins, and such-like; but he also took a plated inkstand. That looks as if he did not know his trade. And yet, to have effected an entrance just where nobody would have thought such a thing practicable, he must have been most uncommon cunning. Cunning? No, for then I should see the thing as plain as the church tower. It 's downright unaccountable. How is it humanly possible that things can be stole out of a second-floor window without a ladder, or anything to climb up by, unless it 's a water-spout—*that 's* what I want to know. And what 's more, even if he got up, how did he ever get down again?'

Hearing these remarks put aloud, and in an interrogative form, Mrs Stott thought it incumbent upon her to speak, and the more so, as she had ingeniously elaborated a theory of her own to account for the whole mystery.

Digitized by Google

'If nobody could have got in from the outside, John, people as was inside could have done it easy enough. It was one of them trapesing servant-girls, who dresses so fine, and is always wanting money to buy gewgaws, you may take my word for it.'

'I don't suppose, ma'am,' returned the chief-constable with supreme contempt, 'that the Bench of Justices would "take your word for it," even if *I* was weak enough to do so—which I am not. The servants are all above suspicion, both at Sir Robert's and Mrs Peewit's—that was the first thing as we looked to of course. But even if it were otherwise, do you suppose that thieving is an epidemic, that it should break out in one household to-day, and in another to-morrow, as this has done. You had better go to sleep, ma'am, and leave me to think the matter out alone.' Which, accordingly, this great man, having drawn his nightcap on, the better to consider in, proceeded to do. 'Two burglaries on two following nights, in a town under his personal superintendence, and nobody yet in custody! He had never imagined that such a blot could befall his 'scutcheon! It was not impossible, in a town so slenderly guarded, that a ladder might have been employed without detection, but, most certainly in neither of these cases had such an instrument been used. The flower-boxes had, in both instances, projected beyond the sill, so that the top of any ladder must have rested on them, and left its mark. There was also no trace of the foot of it in the soil below—or sign of an attempt to remove such trace—although, in the case of Sir Robert's house, there was a flower-bed immediately beneath the window.' Mr Stott, in short, brought all his intelligence to bear upon this problem in vain, and nothing came of it but headache.

Next day, the whole town was in a state of intense alarm. The previous robbery had created much excitement among the inhabitants, but not so much on account of the crime as of the sagacious manner in which their chief-constable had discovered the mode of depredation; but now, not only had a second outrage been committed, but the *fact* of its occurrence while the acrobats were away had proved their innocence of this particular offence (though the magistrates, not knowing how else to account for their seizure, committed them for a month, as rogues and vagabonds), and negatived Mr John Stott's solution of the riddle altogether. The chairman of the Bench, who had been accustomed to suck that official's brains before addressing his audience in the Town-hall, had nothing to say upon the subject except to recommend people to shut their second-floor windows, which, since it was very warm weather, and most of them cultivated flower-boxes, did not give general satisfaction.

The next night, the mayor's own house was robbed in a precisely similar manner.

It was on a Friday, and the local papers which came out the next day, published second and third editions, to describe the details. Besides the burglary, a sort of sacrilege had been committed. The thief had actually possessed himself of the Municipal Mace. This beautiful object, although not intrinsically valuable, had apparently excited his greed, for he had dragged it out of its case as far as the window, and thence let it fall with a report that had alarmed the house, and dinted the ground below. When the door was opened, however (which the servants declined to do, until the 'proper authorities' arrived), the marauder had vanished, and with him this Emblem of Authority, as well as a pair of his Lordship's boot-hooks. There happened to be nothing kept in that room but the mayor's boots and the town mace. But the incident was, of course, as distressing to Mr John Stott as though the regalia had been plundered. He felt that his great reputation was giving way under these repeated shocks; while the rest of the constabulary were of course overwhelmed with disgrace; and the Tory newspaper openly advocated 'stringent measures' and the calling out of the Yeomanry.

'I suppose,' sighed his wife, upon this Saturday afternoon, 'there is no chance of your going with me to-night to the Show? And yet it seems such a pity, after that civil Mr Shaw has sent us these tickets: and you know I never enjoy anything—let it be wild beastesses, or what not—without you, John. How fine they look, with this picture of the lion and the unicorn—though the bill says as the unicorn is dead—with *Shaw's Show*, "patronised by all the crowned heads of Europe," and "admit the bearer," with his autograph in the corner, in red ink! Why, the mayor's own invitations are not more splendid.'

'Don't talk of the mayor, woman, for that makes me think of the Mace,' replied her husband with a shiver. 'I don't wish to see any show but one, and that's the man that stole that mace with a pair of handcuffs on him, or what would be better still, a-standing underneath a bit of wood, with a rope round his neck, and a parson by his side. But there; it's no good wishing. Upon my life, I sometimes wonder if the devil himself is not a-doing on it all, to vex me.'

'Lor, John, you make me creep!'

'Well, I can't make you *fly*, I reckon,' replied Mr Stott surlily; 'and yet that's what this fellow can do, confound him! He's like a bird of the air—a bird of prey.'

'Well, John, do you know I can't help sometimes thinking—only I would not have mentioned it unless *you* had—that, perhaps, after all, it *is* a bird! You know a magpie is a thief by nature.'

'And so you suppose a magpie could have stolen the town mace, do you? Why, you are a greater fool than the newspapers.'

'I forgot the mace, John,' observed Mrs Stott humbly.

'I wish *I* could forget it,' growled the chief-constable. 'You had better put on your bonnet, and take my ticket round the corner to Mrs Jones, who will be glad enough to go with you; only take care Shaw don't keep you both, and put you in a cage for a pair of owls. There, I'm sorry to be so rude, Mrs Stott; but the fact is I feel as I shall go out of my mind unless I tackle this mystery; and I must be left alone to think it out.'

So Mrs Stott, obedient wife as she was, attired herself in gorgeous apparel, and accompanied by her friend and neighbour, the parish doctor's wife, honoured Mr Shaw's menagerie with her presence. It was a sort of fête which that practical student of Natural History (which included some knowledge of mankind) had given to the inhabitants of the town, and everything was on a very splendid scale. The show was lit up by rows of chandeliers, made of circlets of wood and candles, from the latter of

Digitized by Google

which, as they of necessity hung very low, the tallow dripped upon the heads of the company; but that was not found out till the next morning. The floor and cages had been thoroughly swept and garnished, and some attempt had even been made, by means of unguents and spices (or, in other words, chlorate of lime), to mitigate the odour that hangs about all establishments devoted to the reception of wild beasts. But it must be confessed that this last refinement was a failure—it was like the jar of *ottar*, which, 'do what you will, the scent of the roses would cling to it still;' only in this case the perfume was the result of a combination; the hyena and the musk-rat, the royal Bengal tiger and the marmoset, each contributed their *soupçon*. In place of the usual showman, Mr Shaw himself, with an elegant white wand, pointed out the various objects of interest, explained their habits, and narrated anecdotes of their extraordinary sagacity. The monkey-cages, as usual, were the chief attraction; their innocent gambols, and the remarkable *penchant* they exhibited for biting each other's tails, were the admiration of the beholders. Mrs Stott, while regarding these parodies upon mankind with a contemplative air, was very nearly—indeed literally within half an inch or so—paying a great penalty for her philosophic abstraction. A ribbed-face baboon of gigantic size, looking not unlike one of Mr Cooper's Indian heroes in his war-paint, made a snatch at her fingers, which, loaded with rings, happened to be ungloved, for she had just been taking refreshments.

'Your charms even vanquish the brute creation, Mrs Stott,' observed the clerk to the magistrates gallantly; 'the enamoured animal seeks your hand.'

'Yes; but, like the rest of the male sex, for what is in it, or on it,' replied Mrs Jones, who had been an heiress in a small way, till her husband removed from her that invidious distinction by spending all her money.

The ribbed-face baboon screamed with disappointment, and swung by his rope head-foremost, and with his eyes shut, for the rest of the evening.

It was 1 A.M., and the chief constable's wife had been in bed since midnight, but she had not yet fallen asleep. She was awaiting the arrival of Mr Stott, in hopes that he might have some good news to tell her, or to comfort him with her sympathy in case he hadn't. It was a beautiful night, and she had left the window open, through which the soft fresh air came gratefully enough after the atmosphere of the menagerie. She would be able to catch the majestic footfall of her lord while it was yet a great way off, and she was listening for it. Presently, through the deep summer stillness, sounded a human step, which, albeit not that she was expecting, seemed familiar to her. It was a step which, although it moved with quickness, had a slight limp, such as she had noticed in the gait of Mr Shaw. Yet he had himself assured her that very evening that he was a man of early habits, and always shut up his house on wheels before twelve o'clock. It was most unlikely that on the night of his fête, of all nights, he should have made an exception to this salutary practice; and yet she knew no other step than his like that step. It stopped beneath the window, and then there was a sliding, scrambling noise, as though something were struggling up the water-pipe that ran down the side of the house, and she felt at once that the mystery of these nightly Thefts was about to be solved.

She was frightened, of course; but she did not shut her eyes and put her head under the bed-clothes, as most ladies would have done under such circumstances; on the contrary, she stared so hard at the window, that the sides seemed to meet, and leave no window at all. Or was it that the space had become obscured by the presence of the marauder? Yes, that was it: and what a marauder!

The face of the intruder she could not catch; but she saw that he was quite black, very inadequately attired, and provided with a long tail. That late imprudent reply of hers to her husband, 'But the devil *has* wings,' came into her mind with terrible emphasis. No wonder that even the chief-constable's vigilance had failed to——

Ah, that face! There was no mistaking those very strikingly marked features! It was, without doubt, her late admirer, the ribbed-face baboon; and whether from motives of delicacy or fear, Mrs Stott did dive under the bed-clothes then, with only her nose left out to breathe through, like the elephant when under water, as Mr Shaw had instructively informed her not three hours ago.

She could hear a little, however, as well as breathe; and she distinctly caught the quiet chuckle of her visitor, and the chink of her rings as he swept them off the dressing-table with his hairy paws. Presently, there was a shrill whistle from below, and the chuckling ceased; and then came the sliding scrambling noise again. The ribbed-face baboon had put the rings in his mouth—having no pocket—and slid down the water-spout to his master with the spoil.

'John,' cried Mrs Stott, when the chief-constable put in his long-wished-for appearance, and as soon as he had got inside the door, 'I've found it all out.'

'Pshaw!' said her husband contemptuously.

'Lor,' cried she, 'well, you *are* a wonder! How ever did *you* find out it was Mr Shaw and his ribbed-face baboon?'

'Never you mind, ma'am,' rejoined Mr Stott with his old confident air; 'I *have* found it out. And now let me hear how far your testimony goes in corroboration of my views.'

The next day, 'from information received,' as he darkly hinted, the chief-constable apprehended the keeper of the menagerie, and searched his house on wheels with such effect that all the stolen property was recovered. Mr Shaw, it appeared, had trained the ribbed-face baboon to climb up water-spouts and sweep from dressing-tables all articles that glittered, which accounted for his taking the plated inkstand and the municipal mace. If his education had been suffered to progress, he would doubtless in time have been taught to carry off bank-notes and railway dividends. But, thanks to Mrs Stott, his occupation was henceforth gone. The chief-constable, however, got all the credit for the discovery, and was held by everybody, including his wife, in higher estimation for sagacity than ever. It was true that he had been at fault at first, and in more than one instance; but then, as he himself observed: 'I may still say as no man ever took me in twice—for this was not a Man, but a Hape.'

The above curious incident happened at Shrewsbury in 1834, and was without doubt the circumstance on which Edgar Poe founded his famous story of *The Murder in the Rue Morgue.*

FRANCOIS RABELAIS.

When a great revolution sweeps away the fetters of tyranny, though there may be some men who will devote their new-found liberty and unchained energies to the foundation of a new government on juster bases, there will always be many more who take advantage of their freedom from control to make a general carnival. So it was in the beginning of the sixteenth century, when the great revolution, called the Renaissance, cleared the world of thought of the empty dogmatism of the priests, and the arid formulas of the schoolmen. There were men who only shook off their old bonds, to bind themselves anew as voluntary servants of the great causes of art, religion, or philosophy. But others were set free to drift, without anchor and without object, on the ocean of life. An age of exalted positive thought is always also an age of scepticism.

Scepticism may influence a noble mind in three ways. Of these—as one of his critics has said—Shakspeare has given us instances in the characters severally of Hamlet, Iago, and Falstaff. One kind of men it will drive into profound, but sorrowful, speculations on the nature of God and the world, life and death—speculations full of interest and value to mankind, but bringing to the thinker himself little else than sadness and despair. 'We see him quite shut out from hope: looking not into the golden orient, but vaguely all round into a dim copper firmament, pregnant with earthquake and tornado. . . . . A feeble unit in the middle of a threatening infinitude, seeming to have nothing given him but eyes, whereby to discern his own wretchedness.' So Carlyle of his famous Professor. Byron, Swift, Rousseau, and Shelley give us a similar account of themselves. The second type becomes cynical, selfish, intriguing. Of this there are examples sufficient in the Italian statesmen, the cardinals and the popes, of this Renaissance period. Machiavelli, whose name has become proverbial, is, perhaps, really less open to such charges than many of his contemporaries. But it is the third type that is at present the most interesting to us. In every great period of history we shall find a Falstaff as well as a Hamlet, the laughing philosopher, to throw the weeping philosopher into stronger relief; but nowhere do we see the ideal Falstaff more completely realised than in Rabelais—no better instance is there of a giant intellect, set free from bondage, plunging madly into the wildest and most riotous carnival of thought, full of the grotesque, the unclean, and the sublime, and, under every mask, full of laughter. He is said to have died with a loud laugh upon his lips, and as was his death, so was his life. The personal friend of the greatest men of his time, he was continually making them the objects of his practical jokes. Human life, of whose highest problems he had a keen perception, seemed to him the broadest of farces. *Rire est le propre de l'homme,* he says to his readers at the beginning of the *Life of Gargantua,* and he repeats his text again and again.

There are few important writers about whom there are so many different opinions. According to some critics, there are in Rabelais the germs of all modern thought. Others call him a mere drunken buffoon, whose reputation is based chiefly on his obscurity. As in all controversies, there is exaggeration on both sides. Rabelais calls himself 'the oracle of Goddess Bottle;' he 'emptied his bottle before he wrote, while he was writing, and after he had written;' and much that he has written seems to be little more than the natural outpourings of such inspiration. But this veil of buffoonery was to a great extent assumed, for the sake of safety in the age of the burning of heretics; and the same may be said of his obscurity. Where the buffoonery is most outrageous, or the obscurity deepest, a gleam of the brightest light is sure to dart out unexpectedly from the shadows. Yet, little credit can be given to the elaborate interpretations of his commentators, who, probably, like the commentators of Homer and Aristotle summoned before Gulliver in the island of Glubbdubdrib, keep in the most distant quarters from their principal, in the lower world, through a consciousness of shame and guilt, because they have so horribly misrepresented their author to posterity. These attempt to make a consistent whole of a work which was published in several parts, at different times in the life of Rabelais, and with very different objects. In the prologue to the first book, he certainly leads us to believe—what we must find out for ourselves before we have made much progress—that there is throughout an under-current of meaning. But it is equally certain that in *La Vie de Gargantua et de Pantagruel,* we have no allegorised version of any particular period of history. Historical events, no doubt, are repeatedly referred to; but the satire extends beyond them—it is universal.

The passage in the prologue just referred to is loosely paraphrased as follows: 'Alcibiades, in the dialogue of Plato called the Banquet, praises his master Socrates, without dispute the prince of philosophers, and, among other words, says that he is like a Silène. Silènes were little jars, like those we see now-a-days in apothecaries' shops, painted outside with merry and fantastic figures, harpies, satyrs, horned hares, winged goats, stags in harness, and the like—fanciful mimicries moving the world to laughter, like Silenus, the master of good Bacchus; but within were stored rare drugs, as ambergris, spice, musk, civet, and jewels, and other precious things. Such, said he, is Socrates, for, look at him outside, and judge by his exterior, and you wouldn't give a slice of onion for him, so ugly is his figure, and so ridiculous his general appearance—a pointed nose, the look of a bull, the face of a fool, the manners of a simpleton, the dress of a chaw-bacon, the fortune of a beggar, unlucky in love, incapable in all affairs of state, always laughing, always drinking more than any one else

Digitized by Google

in the world, always making a fool of himself, always hiding his divine philosophy. But open this jar, and you will find within a drug that was sent from heaven, and is without price, a width of soul more than human, wonderful virtues, invincible courage, unequalled sobriety, steady content, perfect self-possession, incredible contempt for all the prizes for which mankind sit up by night, rush about by day, make voyages, and fight battles.' In the same way, he continues, when you read the merry titles which I put upon my books, such as "Gargantua," "Pantagruel," or "The Dignity of Breeches," you must not decide at once that there is nothing inside but quips and follies, and merry tales. It is not right so lightly to pass judgment on the works of men, for 'tis a saying of your own that the cowl does not make the monk. You should therefore open the book, and weigh with all care what meaning lies therein, and you will find that the drug contained within is of a value quite other than the promise of the jar.'

In this description of Socrates, Rabelais gives us his own character as much as that of his book. In personal appearance, he has been compared to Silenus: throughout his life, he was always laughing, always drinking, always making a fool of himself; but within was hidden—in his case, almost as much as in the case of Socrates—a divine philosophy, a width of soul more than human. He was introduced by the Cardinal du Bellay, one of the most distinguished politicians of the time, to the guests at dinner in the latter's house as 'le plus gentil esprit et le plus docte personage de la république des lettres.'

François Rabelais was born at Chinon in Touraine, in or shortly after the year 1483. His father was innkeeper* at the sign of the *Lamprey*, and also possessed a vineyard called La Devinière, a few miles from the village. Here was produced the white wine of Pineau, spoken of more than once with praise by the innkeeper's son. And it was in this vineyard—a meet birthplace for the 'oracle of Goddess Bottle,' that Rabelais was born. The lovely scenery of his birthplace made a deep impression upon him; his writings are full of references to the neighbourhood, especially to Sevillé and its abbey of Benedictines. The monks began his education. He can scarcely have learned much from them. If the picture in the first book of his work is at all faithful, they were more devoted to the bottle than to books; but he seems to remember them with affection. Rabelais was as yet a child, and ignorant, and could love the child-like simplicity of these country monks, without being aware of their ignorance.

He was soon, however, to have experience of the ignorance and barbarous pedantry which distinguished the monastic orders. In 1511, he became a priest himself in the Franciscan convent of Fontenay le Comte. Some years had been spent, on leaving Sevillé, at the university of Angers. Of what passed during that time we know little. Rabelais was beginning to know something of the great outside world. The three brothers, Du Bellay, —two of whom afterwards became cardinals, and the other an illustrious soldier—here became his friends, as they continued to be throughout his life. And now he, who was to be one of the most formidable enemies of the church that the world has seen, has taken priest's orders—as did Swift, and Sterne, and Cervantes (nearly) after him. And he who tells us, 'je cuide que soie descendu de quelque riche roi, ou prince, au temps jadis: car onques ne vistes hommes qui eust plus affection estre roi et riche que moi,' has bound himself with a vow to perpetual poverty. His time, however, was not ill spent: he devoted himself to the study of the Greek language, which became as familiar to him as his mother-tongue; and by application to the great works of ancient literature, he laid the foundations of his wonderful style. The jealousy of the monks was roused by the superior learning of Rabelais, which also opened his eyes to their ignorance and bigotry. They said that the language of Homer was barbarous. His anger, as usual, vented itself in ridicule. A feud arose. The monks were made the victims of a hundred practical jokes. Rabelais was sentenced to imprisonment for life in the convent prison, and was only released by the forcible entry, in a body, of his friends.

We have now reached the year 1524. In 1516, Zwinglius had given voice to the indignation of the people at the tyranny of the Church in Switzerland. Two years after, a more eloquent voice was heard at Wittenberg, denouncing the same abuses; and the utterances of Luther and his fellow-reformers were received by the people with increasing interest and belief, and every day produced a more intense hatred and fear among the monks and clergy. The movement had spread into France, and was there met by the orthodox with their wonted weapons, the rack and the stake.

Rabelais could scarcely be called a reformer; yet, with many points of difference, there were some points of likeness between him and the reformers. He, as well as they, had set himself free from the restraints of effete medieval thought. He was not likely, it is true, to be of much service in building up new dogmas on the ruins of the old. But the time for building had not yet arrived: the preaching of the reformers was as yet only destructive; many of them therefore hailed him with eagerness as a kindred spirit. His learning and the general tendencies of his genius were known, and *Gargantua and Pantagruel* had not yet been written to shew that his mind was uncontrolled and uncontrollable by any kind of dogma. If anything of his epicureanism was known, it must be remembered that there was a much greater latitude for the expression of epicureanism in that age than this—that the good Luther himself could say with approval: 'If you don't love wine, women, and music, you will always be a fool'—a dictum worthy even of the Rabelæsian philosophy. If, then, Rabelais could be mistaken for a reformer by the great leaders of the Reformation (he was for some time the friend of Calvin), how much more likely was it that such a mistake would be made by the half-educated monks, whose very dulness made them keener to smell out heresy?

Rabelais saw his danger. Fortunately, he had friends among the high dignitaries of the church, many of whom favoured the new cause. A bull was obtained from Clement VII., allowing him to quit the Franciscan order, and cancelling his vow of poverty. He retired into the service of Godefrey

* According to some authorities, the father of Rabelais was an apothecary.

d'Estissac, Bishop of Maillezais, whose private secretary he continued to be for some time. The bishop, who was a great patron of literary men, remained the friend of Rabelais long after the latter had left him, corresponding with him, and filling his purse when it was empty, which was the case very often.

We next find him parish priest of Sonday, on the appointment of the brothers Du Bellay. He had studied Hippocrates and Galen with great care, and he now began to put his knowledge of medicine into practice. Imagine the laughing philosopher on his mule, riding about from cottage to cottage in his parish, his basket of herbs under his arm, looking now more than ever like Silenus. This period is filled by his biographers with innumerable stories, more or less mythical, but characteristic. But we must pass them by, and follow Rabelais to Montpellier, where he began his studies in the School of Medicine about the year 1530.

Like all other branches of knowledge, the science of medicine had made rapid progress in the last few years. In 1526, Paracelsus had created a great sensation at the beginning of his professorship of physic and surgery at the university of Basel, by burning publicly in the amphitheatre the works of Avicenna and Galen, assuring his auditors that the latchets of his shoes were more instructed than those two physicians. His frantic claims to be regarded as the legitimate monarch of medicine were by most men laughed to scorn, and he himself was compelled to take flight from Basel. But it was true that the old science was passing away, and a new science was about to arise, a science of which Rabelais was to be one of the most illustrious founders.

Rabelais, however, did not cast aside the old authorities. His lectures on Hippocrates and Galen brought crowds to hear him. Those writers reappeared in new editions, under his supervision; and he rapidly made himself a name among the doctors by his commentaries upon them. But he did not allow himself to be guided entirely by the experience of others. One day he dissected the body of a criminal who had been hanged the evening before, and lectured upon its internal structure.

While he was engaged in such pursuits, he seems also to have been occupied with another kind of dissection, and one in which he was still more successful. His fame as a dissector of the human body has passed away; but of the art of dissecting the human mind he remains to this day an acknowledged master. The first edition of the *Life of Gargantua* appeared in 1532. The title is: 'The great and inestimable Chronicles of the great and enormous Giant Gargantua, containing his Genealogy, the Size and Strength of his Body, as well as the marvellous Feats of Arms that he did for King Artus, as you shall see hereafter.' His fame as a physician was at once eclipsed by this 'livre seigneurial,' which, he tells us, 'was entirely written in that part of his time which he set apart for his bodily refection—that is to say, for his eating and drinking.' His printers said that they had sold more copies of it in two months than of Bibles in nine years. Like *Don Quixote*, it was intended as a satire on the extravagant tales of knight-errantry which constituted the popular reading of the age.

Satire, more than any other kind of art, seems to be the child of mature genius. Rabelais was now nearly fifty years old. Cervantes was fifty-eight when he gave *Don Quixote* to the world; Swift was sixty at the time of the publication of *Gulliver's Travels*. The poet or the painter may confine himself to a narrow field of observation, and yet be successful, their work being too minute to cover a very wide surface. But the satirist must range through the whole world of thought and life: he, too, must study the minute details, but only with a view to the whole, which he must represent with a few bold sweeping lines, not one of which but must suggest a hundred details. To accomplish this end he must spend years in study, not only of books, but of men. The poet and the painter have to deal with truth, of which they gain knowledge by flashes of inspiration, rather than by watchful experience. But the satirist, though without some such inspiration he is nothing, requires a vast experience of the foibles and vices of society, and the pedantries and extravagances of philosophy, in order to write his comedy of human life, and make it acceptable to mankind.

Shortly after the *Life of Gargantua*, appeared, with a new edition of the same work, 'newly augmented and corrected by Maistre Jean Lunel, Docteur en Théologie,' the 'Pantagruéline Pronostication certaine, véritable et infallible, pour l'an MDXXXIII., novellement composée au Profit et Advisement des Gens estourdis et Musars de Nature, par Maistre Alcofribas, architrinclin dudit Pantagruel (Petit in-8° de 8 feuilles, sans lieu ni date).' Another mock-astrological work was published about the same time—to this Rabelais prefixed his own name, 'François Rabelais, Docteur en Médecine et Professeur en Astrologie.'

As yet he had made no systematic attack on theology or the church; but there is sufficient bitterness in the incidental references which he has made to them. Here is one of these—a passage which, however, may have been inserted in a later edition. Rabelais has just described the birth of Gargantua—how he made a summersault, and came forth from the left ear of his mother. 'This done, he did not cry like other children: "Mie, mie, mie!" but called out with a loud voice: "Drink, drink, drink!" as if he were inviting all the world to come and drink. . . . . I doubt not that you will disbelieve this assuredly strange manner of nativity. If you do not believe it, I don't care; but a good man, a man of common-sense, believes everything he is told or finds written down. Saith not Solomon, Proverbiorum xiv., Innocens credit omni verbo, &c.; and again St Paul, prim. Corinthior. xiii., Charitas omnia credit? Why don't you believe it? Because, you say, it is without probability. I say to you, this is the very reason why you should believe it with a perfect faith; for the Sorbonnists say that faith is the argument of things that have no probability.' And so on. Such passages, and his known opinions, were sufficient to excite the suspicions of the theologians, but the storm of universal theological indignation did not yet burst upon Rabelais.

We next find Rabelais at Rome, in the train of Cardinal Jean du Bellay. The latter had returned from his embassy to Henry VIII., in which, according to some authorities, he was accompanied by Rabelais, in the capacity of family doctor and

Digitized by Google

private secretary. This visit of Rabelais to England—which, however, does not rest on very strong evidence—took place before he began his medical studies at Montpellier. The cardinal was now at Rome, in order, if possible, to settle the difficulties between the pope and Henry VIII. This time it is certain that Rabelais was with him. We have a collection of letters, dated from Rome, from him to his old friend and master, the Bishop of Maillezais. They are very interesting, as they are full of his opinions on the political position of Europe, given in his own rich and lucid style, and making one of his biographers almost regret that he had devoted his genius to satire instead of actual history. One characteristic runs throughout: like Socrates, Rabelais was always 'pauvre de fortune:' in almost all the letters there is a request for more money with all speed. Rabelais was far from being wise as the children of this generation are wise. His restless spirit would not suffer him to stay many years in one place, however lucrative it might be. And the same uncontrollable energy of thought would not allow him to dissimulate his opinions, though the expression of them might be dangerous. He could not restrain his unquenchable love of pleasure and merriment. His money was spent as fast as he received it; and he made royalty itself, even the pope, objects of his practical jokes. But jokes were seldom the cause of great enmity or bitterness. There was something in his manner—something of gentleness and magnanimity beneath the wild merriment of his conduct—that made all, except rough bigots and narrow pedants, kindly disposed towards him. And there was something in that age, a childlike love of mirth and extravagance, which inclined all vigorous minds to this lord of frolic and misrule. Men were as yet ardent in their likes and dislikes. The fervent admiration the child feels for all that is free, and beautiful, and noble, had not yet given place to the cold cynicism of the maturer eighteenth century. The follies of Rabelais were regarded as a part of the wonderful vivacity of his intellect, while a later age had neither a like admiration for the genius of Steele or Fielding nor pardon for their follies.

The rest of the life of Rabelais was occupied chiefly with his great work. About 1534–35, he returned to France, and published a new edition of *Gargantua*, in much the same condition as we now possess it. The title this time was: 'La Vie inestimable du grand Gargantua, Père de Pantagruel, jadis compousée par l'Abstracteur de Quintessence; livre plein de Pantagruélisme (Lyon, Fr. Juste, 1535, in-16 de 102 f. goth).' The first part of *Pantagruel* appeared about the same time. The storm then began to burst. The writings of Rabelais were received by the educated with unbounded enthusiasm, while the ignorant began to view them with ever increasing hatred; and not only the ignorant monks and priests, but the Aristotelians and Platonists of the university, and the leaders of the Reformation, joined in the outcry against them. The friendship between Rabelais and Calvin came to an end, and was followed by a mutual declaration of war. When the former went back to Rome in 1536, it was thought necessary by his friends to obtain for him a special bull of absolution from Pope Paul III., which also appointed him prebend of the Benedictine Abbey of St Maur.

In 1537 he left Rome, and, having taken his doctor's degree in medicine at Montpellier on his way, he is again at Paris. For the next nine years he is engaged in his profession of physician at Paris, and perhaps partly in the Abbey of St Maur. He is not, however, neglecting *Pantagruel*, a continuation of which appeared in 1546. It is dedicated to the Queen of Navarre. The monks, the pedants, and the reformers became more indignant and violent than ever. There are two reasons for this increase in the wrath of the reformers: the satire of Rabelais had become much more bitter; and the reformers were now much more decided in their aims. The parties in the church were now more clearly defined. The reformers had gained strength, and were no longer in need of powerful though dangerous alliances with great men, simply because they were opposed to the abuses of Rome. They looked for and found a useful assistant in such men as Rabelais, so long as their policy was merely destructive; but when they began to construct anew, they found that he was as ready to pull down the new as the old. Henry Estienne said of him: 'Though Rabelais seems to be on our side, yet he is continually throwing stones into our garden.' Most of the reformers handled his name much more roughly. The monks and pedants had always been his enemies. And now the University of Paris (the 'Sorbonnistes' of a passage already quoted) petitioned King Francis to condemn the scurrility and heresy of the works of Rabelais. Rabelais sent a counter-petition, very characteristic of its author, to the effect that, 'Whereas certain printers and publishers have introduced matter into the writings of Master Frahçois Rabelais which has been the cause of much public discontent, and also of much detriment to the author's meaning, the said author begs that those printers and publishers shall be reprimanded, and permission shall be given to him to continue his work.' The king's reply was entirely in favour of Rabelais. 'He had,' he said, 'a horror of all such serpent-eaters (*mangeur de serpents*) as found the charge of mortal heresy on the fact that somewhere an *n* is put for an *m*, through the fault and carelessness of the printers.'

Francis I. died in 1547. He had been throughout the friend of Rabelais, as well as of all who were distinguished in literature and art. Leonardo da Vinci died in his arms; Erasmus received from him the offer of the government of his new royal college. With all his faults—and they were many—we cannot but love this king of France. Who does not remember what Andrea del Sarto says of him in Mr Browning's poem?

> That Francis, that first time,
> And that long festal day at Fontainebleau!
> I surely then could sometimes leave the ground,
> Put on the glory, Rafael's daily wear,
> In that humane great monarch's golden look—
> One finger in his beard or twisted curl
> Over his mouth's good mark that made the smile,
> One arm about my shoulder, round my neck,
> The jingle of his gold chain in my ear,
> I painting proudly with his breath on me,
> All his court round him, seeing with his eyes,
> Such frank French eyes!

Henry II., who succeeded Francis, extended the same indulgence to Rabelais, who, after a third short visit to Rome, was appointed curé of Meudon. This appointment he owed to his friend and protector, Cardinal Jean du Bellay, now Bishop of

Digitized by Google

Paris. The enemies of Rabelais became still more furious. Peter Ramus, the celebrated reviver of the Platonist philosophy, made a violent attack upon him; but it was like handling a scorpion to use words as weapons against Rabelais. The abuse of Ramus has been forgotten; but it will never be forgotten that in the fourth book of *Gargantua and Pantagruel*, which was published at this time (1550 A.D.), there is a certain 'poor Rameau who finds that he is destined to be an object for spitting upon to the remotest posterity.'

The literary career of Rabelais, so far as it had to do with his contemporaries, is now at an end. The fifth book of *Gargantua and Pantagruel* was not published until after his death.

In 1553, at the age of seventy, he died. The last few years had been spent in his parish of Meudon, in quiet charity. He had never been ascetic in his life, and he did not become so now, but liberally ministered to the bodily as well as the spiritual wants of his parishioners—beloved by all. Meudon, while he was there, was a favourite resort for Parisians on Sunday. They used to say, and the saying was still repeated as a proverb a century after: 'Let us go to Meudon: there we shall see the castle, and the caverns, and curé, who is, of all men in the world, the most pleasant to look on, and the most good-humoured, and who gives his friends and all good people the best reception and the best discourse.'

When at last death was approaching, a page came to his bedside with inquiries about his health from the Cardinal de Chatillon. 'Dis à monseigneur,' he said, 'en quelle galante humeur tu me vois; *je vais quérir un grand peut-être.* Il est au nid de la pie; dis lui qu'il s'y tienne, et, pour *toi*, tu ne seras jamais qu'un fou.' When the last moment came, he said, with a burst of laughter: 'Draw the curtain; the farce is played.'

Of the great work of Rabelais there is not space for more than a few words. The object of the earlier part is to satirise the extravagant romances with which the age abounded, and of which we find a very copious list in the first book of *Don Quixote*. As the narrative proceeds, the language becomes more caustic, and bears more distinct reference to the questions of the time. We miss, too, as Hallam says, the luxuriant merriment of the beginning. In form, the satire follows the model of Lucian, but its spirit flows rather from the inspiration of Aristophanes. The language of Rabelais is peculiarly rich and eloquent. The study of it is most interesting, as it is the chief fountain from which modern French draws its characteristics. In places it is very obscure, but the difficulties have been much exaggerated. The English translation of Sir Thomas Urquhart, which is generally considered to be a masterpiece among translations, contains all the difficulties of the original. The *Contes Drolatiques* of Balzac, avowedly imitations, in style and language, of *Gargantua and Pantagruel*, are more difficult.

In a certain sense, Rabelais is the father of all modern satire. His influence is visibly present in *Don Quixote*, the plays of Molière, in the works of Sterne, Thackeray, Voltaire, and even of Charles Kingsley. But a larger portion of his spirit descended upon Swift than upon any other. Episodes in *Gulliver's Travels* are drawn directly from Rabelais, though the individuality of Swift has made them his own. The *Tale of a Tub* (though now generally attributed to Dr Arbuthnot) is evidently an imitation throughout; Hallam says that it is the best imitation. But there was an immense difference between the two men. Rabelais enjoyed life, laughed always and at all things: Swift's life was spent in hatred of men and gods, and his laughter was even greater torture to himself than to the objects of his hatred.

ABOARD THE SEA-MEW.

IN TWENTY-TWO CHAPTERS.—CHAPTER XIII.

THAT trap took just as I expected. Brassey leaped up like a wounded tiger, and, cutlash in hand, Van bounded down the staire, when the two men were locked in a sharp tussle in an instant, leaving the way clear for me to slip up, gain the mizzen shrouds, and make my way up into the top, where I laid my treasures; went hand-over-hand by the stay, and got down to the deck again in the dark by the main shrouds, without being seen, and joined the party that was being collected by the noise and shouting in the cabin.

'Curse you; bring a lantern. Help here, or he 'll end me,' roared Van in a smothered voice; but not a man dared go down till I offered, and, making-believe to be afraid to venture without a cutlash, one of the chaps handed me one; and with the lantern in my other hand, I went cautiously down, chuckling to myself to find that Van and Brassey had been mauling one another awfully, and if it had not been for my coming, there 'd no doubt have been an end of one of the scoundrels; for, woke up wild and savage from a drunken sleep, Brassey had attacked Van fiercely, and when I got to them, had him down and half-throttled.

There wasn't a man that didn't grin as Van cursed and raged at Brassey for a drunken fool, starting up and knocking the lamp over; while Brassey swore that Van struck him first, shewing his bleeding head as a witness; but after such an up-and-down fight as they had had in the dark, no one took much notice of what he said, every one, themselves included, taking it for a false alarm; and we all separated, leaving Van and Brassey sore and savage as could be.

Knowing how frightened some of the prisoners would be, I says out loud to one of the chaps as we passed the broken panes: 'Don't s'pose the captain thought there was so much muscle in old Brass.'

'Hold your tongue,' says the other; 'he 'll hear you;' and then we both laughed and walked forward, me wishing the while that those below could have known of my luck, but satisfied that they would feel that there was nothing particular the matter.

Feeling pretty sure that Van would not be on deck again that night, I waited about three hours all in a tremble, as I lay in my hammock, for fear I should go to sleep, and forget to fetch the weapons; and even then, spite of all my pains, lying there and trying to keep awake, if I did not drop off, and dream that they were missed from the cabin, and that Van was going to shoot Mr Ward for stealing them. Then I awoke with a start, and it seemed to me that I had been asleep for hours and hours, and I slipped out of my hammock to find, from the men talking on deck,

Digitized by Google

that I couldn't have been more than five minutes. So I crept down again and into my hammock, and once more I dropped off, do all I would to stop it, and this time I dreamed that the wind had changed, and all hands had been piped to shorten sail, when they came across the arms in the top. Then I awoke again with a start, to find that I could hear the buzzing of voices still upon the deck. But I wouldn't risk it any more, though I feel sure I shouldn't have slept above half an hour at a stretch; and sitting down by my hammock-head, I took a bit of baccy, and sat listening to old Sam snoring, till it seemed as if it would never grow late enough to go. At last, I felt that if I meant to act, it must be at once, or there would perhaps be a change in the watch, and I might lose my chance; so I crept up on deck, taking with me a handful of lashing; and as soon as I felt the breeze, I knew that I was not a minute too soon, for with a good mate or captain, orders would have been given directly to shorten sail.

The watch were well forward, and, as usual, the one at the wheel was half asleep, or, being now much lighter, he must have seen me going up or coming down from the mizzen-top where I had left the arms; but no; I got them safe down, and then crawling like a cat along the deck, I threaded the lanyard I had through the trigger-guards of the pistols, and lowered them one at a time, all six, and was just drawing the lanyard back after loosing one end, when I felt a warm hand from below grasp mine, and on drawing it away I was able to pass the six cutlashes down one after the other, to have them taken from my hand.

I'd hardly done before I heard a step on the deck behind me, and dropping flat down, I gave a half-roll over, so that I lay close under the combing, but not daring to move, for it was the watch coming to the man at the wheel.

CHAPTER XIV.

Every morning reg'lar, Van used to take two of the chaps down below to Mr Ward, and he used to doctor their wounds for them, as I used to hear, for, seeing that they never felt disposed to trust me near the prisoners, I used to hang away, and never attempt to go near; but I kept on sending a line now and then by the little bird, telling them that I was making my plans, and that they were to wait a bit. I used to tell them too to feed the linnet, and it got to be so at last that if I wanted it to take a message, all I had to do was to take away its seed and water over-night, and let it loose at daybreak, and it would go as straight as possible to the broken skylight, flit down, and come back in about ten minutes.

I know it must have been a disappointment often to them below; but then I daren't often be sending notes, for fear of being noticed. Then, too, I was puzzled a deal about things; I wanted to know what Van meant by keeping his five prisoners, and what I ought to do for the best. Try and seize a boat, and get them aboard, or to get the upper hand when there was only the watch on deck.

This last seemed the most likely way, for going afloat in an open boat, with the chance of being picked up, is queer work, and the sort of thing that, when a man has tried once, he is well satisfied not to try again. So, being, as it were, head-man, I settled that we'd seize the ship; and after talking it over, the first chance I had, with Sam and Bill Smith, they quite agreed, thinking about salvage, you see; and then I began to reckon up the stuff I'd got to work with.

To begin with, there was Mr Ward, who was as good as two, so I put him down in my own mind two.

Then going on with my best men—there was Sam, who was also good for two, if he was only put in the right way.

Then Bill Smith, who hadn't quite got his strength again, so I put him at one and a half.

Next came Tomtit, who was right enough, no doubt, in his way, only being so long and wankle,* I couldn't help thinking he'd be like a knife I used to have—out and out bit of stuff, but weak in the spring; and just when you were going to use it for something particular, it would shut up, or else double backwards. That's just what I expected Tomtit would do—double up somewhere, so I dursn't only put him down at half a one

Then there was the fat passenger who cried. He shewed fight a bit in the scrimmage, but I hadn't much faith in him; there was too much water in him for strength, so I dursn't put him down neither for more than half. While as for Mr Bell, poor chap, and his sister, they were worse than naughts, being like in one's way. So you see that altogether I had to depend on two and two was four, and one and a half was five and a half, and a half made six, and another half, which I put to balance the two naughts to the bad, making, all told, what I reckoned as six, and myself thrown into the bargain.

And now came the question: How was we good men and true to get the better of seventeen of they? I turned it over all sorts of ways. Once I thought I'd get the doctor to p'ison the lot, only it seemed so uncommon like, even if the others were mutineers and pirates, while most likely they wouldn't have taken the p'ison if we'd wanted them to. P'ison 'em with rum, so that they couldn't move, might be managed, perhaps, with some of 'em, if the stuff was laid in their way; and that might answer if a better plan couldn't be thought of. To go right at them without a stratagem would have been, of course, madness, though Sam Brown was for that when I talked to him, saying, thinking wasn't no use, and all we had to do was to get first fire at 'em twice, and shoot twelve, when we could polish off the other five easy. Now, that sounded all very nice, but I was afraid it wouldn't work, so I give it up, and asked Bill Smith his opinion, but he said he hadn't none.

I'd have given something to have had a long palaver with Mr Ward, for I think we might have knocked up something between us that would have held water; but a talk with him being out of the question, I had to think it out myself; and all I could come at was, that the best thing would be to leave a bottle or two of rum where the watch could find it; and then, if we could shut down the hatches on the others, we might do some good. That seemed the simplest thing I could get hold of, for it looked to me as if the more one tried to work out something fresh, the more one couldn't.

I watched my chance, and wrote out all my plan, and started it to Mr Ward; and this time, I

* Wankle (Lincolnshire), weak, sickly.

Digitized by Google

contrived, when no one was looking, to drop my letter down the skylight, telling him that he was to send me an answer by the bird, writ big, so as I shouldn't make no mistakes in the reading of it. Next morning, as soon as I was on deck, I found that I was too late, for Van and a couple of the chaps were hunting the linnet about, while, as it flitted from side to side of the deck, you could see a bit of white paper tied under its wing, and it must have been that as set them on after it.

I knew well enough that if the bird was caught, it would be all over with my scheme, and p'raps with me; so I went at it with the others, trying to catch the little thing, contriving, though, to frighten it all I could, so that it flew up into the rigging, and being nearest at the time, I followed it out on to the main-yard.

'Be careful, Roberts,' says Van, as I went cautiously out till I was right over the water, the linnet going right off to the end; but I got my feet in the stirrups and followed on, expecting to see it flit off to another part of the rigging. I'd made up my mind what to do if I could get at it; for, though I liked the pretty little thing, there was a wonderful deal depending on whether it was caught or not, while all the time I was abusing myself for not being on deck sooner. I'd let the bird's cage be open the night before, ready for it to get out, and now it was plain that it had been down to the cabin, and Mr Ward had sent me an answer.

But it was no use to grumble; there was the bird before me, and if it would only keep still for another half-minute, I thought I saw my way clear. Plenty were now watching me from below; and fortunately for me, instead of flitting off, the little bird crouched down upon the yard-arm, so that, creeping nearer and nearer, I got quite within reach, when, making a dash as it were to catch it, I knocked the poor little thing stunned into the sea, making a sham slip at the same time, and hanging by my hands.

'Yah-h-h! you clumsy lubber!' roared Van; and then to one or two about him: 'Lower the dingy, and pick up that bird.'

'Lost, after all,' I growled to myself; but we were going pretty fast through the water; and by the time we had heaved to, and let down the boat, the little thing was out of sight, and I felt that for this time we were safe.

CHAPTER XV.

Our every-day life on board the *Sea-mew* had not much in it to talk about. Of course the ship was badly handled, and there was a deal of drunkenness aboard, though hardly ever before night. In the daytime, they just did what little making or shortening sail there was, and then smoked, and ate, and drank just as they liked. After the first few days, they had the fat passenger up, and made him cook, and hang me if one day I didn't see him crying into the soup he was making! But I always kept at a distance, never speaking to him, only kept watching my chance. From what the others said, I learned that Mr Bell was only just alive; while some of them used to talk about his poor sister in a way that made me set to work more than ever to get my plans right.

I got to think at last that if I waited much longer, I should never do anything; so one day, when I had a chance, I pitched a bullet down into the cabin, wrapped in a piece of paper, and on that piece of paper was written 'To-night!'

'Now, if he's the man I take him for, all them pistols will be loaded, and the cutlashes ready for action,' I says to myself; and leaving that to Mr Ward for his part, I warned Sam and Bill, and then set to do mine.

I'd been saving up on purpose; and as soon as it was dark that night, and just before they set the watch, I put two good big bottles of rum where I thought they would find them, and then waited to see.

All things turned out just as I could have wished, for going by an hour after, I could tell from the chatter going on that the three chaps were at the rum, which they supposed to have been left by mistake by those who had the watch the night before. Some of the chaps were carousing in the fore-cuddy, where they could easily be boxed up, and the others were with Van and Brassey, all card-playing in the skipper's cabin.

It seemed almost a hopeless case, now it was come to the point, but I felt that making up one's mind was half the battle, and I was up now, and meant to do or die.

Bill and Sam were on deck, and knew their parts well enough; Bill to manage the chap at the wheel, Sam to shut up the party in the fore-cuddy; I meaning to secure the cabin hatch; and then I thought if that was done, we should have time to settle and lash the watch, who ought to be half-drunk, leaving our hands free to keep those quiet who would be trying to get out of the cabin.

Now my plan was to get Mr Ward up through the hole I made in my fall, if I could get the fellow away who was stationed there, and now it was that I trusted to the rum, for before now Van had been content to have a chap at the cabin door, leaving the watch to make sure the prisoners did not get on deck.

I was about right, for we three had not been watching long under the bulwarks before one of the watch calls out 'Harry!' and the sentry fellow goes to where they were busy with the rum. The next moment I was at the broken skylight, and whispered down the one word 'Tools,' for I was afraid them playing in the other cabin might hear.

Mr Ward was ready, and next minute I was under the bulwark again with the arms the doctor had passed up, and we three had each a pistol in our belts, and a cutlash in our hands before the sentry chap came back.

The night was not so dark as I could have wished, but it was dark enough for us, and, as I expected, the sentry couldn't resist the smell of that rum, and in a very few minutes he was along with the others again, and did not seem disposed to come back. So now seeming to be my time, I said the word: Sam crept off one way, Bill the other, with their orders that there was to be no bloodshed only as a last resource, and I went to the skylight, keeping the side nearest to the cabin hatch, when I turned cold all over, for I heard Van's cough, and he came up the stairs as if to look out.

There was nothing else for it: I knew that if he missed the sentry, he would most likely spoil my plan, so, at the risk of being seen by the watch, I stood boldly up in the sentry's place, took a step this way and that way, and then began to whistle softly to myself like.

Digitized by Google

It was a bold trick, but Van was taken in: he could see some one was on guard; he could hear the watch; and the face of the man at the wheel was plain enough by the binnacle light, so that all seemed well.

'If Bill only makes his attempt now, we're undone,' I thought; but all kept still aft, and then I shuddered like for fear Van should speak to me, but he did not say a word, only turned to go down again, and my breath came freer, as I felt for the lashings I had got ready for the prisoners I hoped to make; while I'm afraid if Van had come up to me then I should have been his death, and then have secured the cabin hatch.

As I said before, I breathed freer, and turned my attention to where the four men were at the rum; but the next moment I was taken all aback again, for Van came up once more, stood still as if listening, and then saying to me: 'Keep a sharp look-out,' he turned once more to go.

'Right,' I mumbles out, as if my mouth was full of baccy, and the next minute I could hear his voice quite plain through the other half of the skylight.

'Now or never,' I says to myself, in dread lest that watchful cur should spoil my chance; and, going down on hands and knees, I leaned through the hole.

'With a will! Mr Ward,' I says, and, grasping my arms, next moment he was through and lying on the deck aside me, just as we could hear the scrooping noise of Sam closing the hatch of the fore-cuddy.

'Quick, Mr Butterwell,' I says, and Tomtit had hold of my arms, but, just as I expected, he shut up when he was wanted, for there was a slight scuffle by the wheel as I gave a heave, the watch stopped their chatter to listen, and as I rose up like to hoist Mr Butterwell out, he went back into the cabin with a crash, falling against the bulkhead which separated it from the cabin where Van was, and if I had not darted to the hatch, he would have been up with the three hell-hounds at his back. But he was too late; I had the hatch over, and then turned to help Sam, who, like a brick as he was, had gone at the watch.

I need hardly tell you that Mr Ward was already in the thick of it; and Bill, coming up, having silenced his man with a tap on the head, it was even odds, four against four; but the fellows fought savagely, and it was not until the sentry was cut down, and another had a bullet through him, that the other two were lashed fast neck and heels together.

Now all this time they had been thundering and battering away at both hatches, but I was in hopes that they would be held fast till we were at liberty, and we made the game we had taken secure before we left them, when a crash told us that something had given way, and running aft, we heard two pistol-shots fired quickly, one after the other, and could see the flashes and a figure standing by the hatch.

My hand was raised to fire, but I dropped the pistol, for I remembered that it was empty; and sword in hand, with my blood up, I dashed at whoever it might be, but only to miss my aim, for he darted aside and caught my cutlash on his in an instant.

It was cleanly done, that guard; and I shouldn't have thought he had it in him, for it was no other than Tomtit, who had climbed out well armed, and sent a couple of shots through the hole Van and his party had battered through the hatch. He was a friend in need, and a friend indeed that time, for if he hadn't come up as he had, it would perhaps have gone precious hard with us.

But there was no time to be lost, for I expected every moment that they would find their way up on deck from one of the cabin windows; and now, in place of wishing for darkness, we prayed for light, so as to be able to see our enemies, and from which side we should next be attacked.

I wanted Mr Ward to take the lead, but he would not—only asked to be set his work, so I set him at the cabin hatch; Bill I planted on the poop, to cut down the first man who should try to climb on deck; Mr Tomtit over the two bound men of the watch, and the wounded; and Sam over the hatch of the forksel, for though we'd got the upper hand, there was no knowing for how long it would be, and besides, we all knew well that if once the savages below got us under, there would be no mercy for us.

What a night that was, and how long the day seemed coming! I was going about from place to place to see if I could make out danger anywhere, when Mr Ward called to me, and made a communication, whose end was that, with Mr Tomtit's help, we drew the two prisoners to the cabin hatch, and left him to guard them and the cabin, while Mr Ward and I dropped through the skylight quick as thought. But they heard us through the bulkhead, and directly after we heard a hand on the door, and the key move, to which I answered with a shot, crashing through the panel, and whoever it was dropped, while for reply another bullet was sent back.

Mr Ward had darted to the inner cabin, while I kept guard, and now appeared with Mr Bell and his sister, she holding him up on one side, Mr Ward on the other.

'Quick as you can, sir,' I whispered, 'for there's some devilment 'most ready;' when mounting the table himself, Mr Ward put a chair ready, and helped Mr Bell and his sister up beside him. He then drew up the chair, planted it firmly, and was through the skylight in an instant. He then asked Miss Bell to mount, but she would not until after her brother; and with the doctor's help, the poor feeble young fellow was dragged up. Then I heard a sound as startled me, and running to the table, I caught Miss Bell in my arms, and dragged her down and to one side, just before three or four pistol-shots came tearing through the bulkhead, making the splinters fly in all directions.

'Now, up, quick,' I said; and leaping on to the table, I dragged her on, lifted her in my arms to Mr Ward, and the next minute she was in safety, when, expecting another firing, I jumped down again, and went on my hands and knees.

Just as I expected, they fired again; but being dark, their shots did not tell; and before they could reload, I had jumped upon the table and climbed out to the rest.

'It's a wonder almost that they did not try to make them safe before,' I said panting; and then, having made Mr Bell and his sister comfortable under the bulwarks, we began to take steps for making ourselves a little surer. For instance, we laid a tarpaulin on the cabin skylight, and a spare sail over that, and then again on the sail we coiled

Digitized by Google

all the rope and cable we could. The cabin and forksle hatches we served in the same fashion, so that it was quite impossible for any one to get up that way; while just about daybreak, when a head appeared over the rail close to the wheel, the chop Bill Smith gave it sent it back again in a moment, so that there did not seem much to fear at present.

Daylight, and then glorious sunrise—a big word that for a common sailor, but sailors, as a rule, think a deal of the bright sunshine and the dancing waters. And a bright morning that was, cheering us up all, so that with a grin I went up to Mr Ward and axed his pardon for hitting him; axing too, at the same time, how he found himself after the stab I put in his pocket. But there, instead of laughing, if he didn't turn almost like the fat passenger, for his lip went all of a tremble, and his voice turned husky as he shook me by both hands and says: 'God bless you, Roberts, and forgive me for ever doubting so true a man for a moment.'

'Don't you be in a hurry, sir, with your thanks. Maybe we ain't half-done yet. We've divided the ship, and got the deck and a breaker of water, and there's what rum them four didn't finish; but they've got the below-decks and all the prog, unless we can find some anywhere else. We've got the upper hand, but now the question is, can we keep it?'

'No, you can't,' shouts one of the fellows lying tied on the deck; 'so'——

He didn't say any more, for Mr Tomtit fetched him a slap on the face with the flat of his cutlash, and then the fellow lay and muttered most savagely.

We had a bit of a refresher in the shape of some cold water, with a dash of rum in it; when Mr Ward said that there was some provisions in their cabin below, and volunteered to get them if I stood at the skylight opening with two loaded pistols, to command the door that Van had kept on the outside.

I did not much like running any more risks than we could help; but food I knew we should be obliged to have, and if we could get it without attacking Van and his party, so much the better; for though I knew that it must come to that, I wanted to put it off as long as I could, and I was just making ready to go to the skylight with Mr Ward, when there was a shout from Mr Tomtit, and at the same moment a bullet struck the bulwark close to where Miss Bell was sitting.

CHAPTER XVI.

Mr Ward sprang like a tiger towards the cabin skylight, where, through a slit in the sailcloth and tarpaulin, you could see a hand holding a pistol twisting about to get back again; but, though it had most likely come through easy enough, the edges of the stiff tarpaulin now closed round the wrist, and though the owner seemed to struggle hard, and having a peephole somewhere, shrieked out as Mr Ward came on, there was no saving the hand, upon which the young doctor's cutlash came down like a streak of lightning, cutting it to the bone, when it was at last dragged through, leaving the pistol upon the deck.

Now, this came from the side of the skylight over the mutineers' cabin, for so far they did not seem to have got into the one where Mr Ward and his friends had been; and seeing this, Mr Ward again volunteered to go down, after we had moved Mr Bell and his sister for safety under the port bulwarks, thrown another sail or two over the skylight, and then bowsed up a bit of an awning, for the sun came through, and beat heavily upon the poor sick man.

But having been made a big man of now, and being consulted upon all points, I give in against anybody going down, for, says I: 'You're too vallable a man to be spared, Mr Ward, sir, and one can only go down after that there prog when we're reg'lar dead beat. Let's hoist a signal of distress, in case we're seen by any other ship, keeping on ourselves steady like, watching well, and taking things coolly as we can.'

My advice was taken, though if it hadn't been, I don't know as I should have gone and hanged myself; and there we sat, listening to the movements of the mutineers below, and wondering what devilry they were planning, till all was still as still, the wind falling calm, and the sea turning like glass; while the only sound we could hear was the twitter, twitter of Mr Tomtit's birds down below, which, by good luck, had got plenty of water and seeds, for, knowing as the little things has sense enough only to eat just as much as is good for them, I had well filled their boxes the day before.

'D'ye hear the birds, Roberts?' says Mr Tomtit to me, just as if there was nothing else in the world but birds, and I do believe as he thought they was the most important things living, save only for a bit when he was thinking of Miss Bell, and perhaps, after all, he thought her only a kind of sweet song-bird as he would like to have along with the others. However, 'D'ye hear the birds, Roberts?' he says.

'Yes, sir, I do,' I says. 'I was just a-thinking about 'em when you spoke.'

'Were you?' he says, brightening up, and laying down his pistol.

'Yes, I was,' I says; 'but don't you lay down that there bullet-iron, for you never know how soon you may want it, sir. While we're like this, sir, you'll have to sleep with both eyes open, and you a nussin' a pistol; while as to what you gets to eat, you must pick that up on the point of your cutlash.'

'But about the birds,' he says eagerly. 'How many are there left?'

'Well,' I says, 'sir, I can't rightly say; but I was a-thinking that if we could get 'em up on deck by shoving a hole through the wires with a boat-oar, there'd be enough of 'em, with 'conomy, to last us all for eight days.'

'What?' he says, staring.

'Why,' I says, 'lowancing ourselves to one big bird a-piece, or two little uns, we could keep ourselves alive for a bit.'

He didn't say a word, but looked just for all the world as if he thought it would ha' been a deal more like the right thing to do to cut one of us up small to feed his little cock-sparrows and things, if they ran short of food. So, just out of a bit of spite like, I says to him drily: 'You might try Miss Bell with them two doves now, sir,' I says.

'Hold your tongue!' he says quite fierce, and looking to see if Mr Ward had heard.

'Wouldn't make a bad roast, sir, and this here sun's hot enough to cook bullock.'

'Will you be quiet?' he says.

Digitized by Google

'And she'd pick them bones, and thoroughly enjoy'——

'Roberts,' says Mr Ward, just then in a whisper, 'what's that?'

I'd heard the sound at the same moment as he did, and for a moment it didn't strike me as to what it might be; but the next instant I was at the side with a cocked pistol in my hand, an example followed by all the others, for, through our bad watching, two men out of the fore-cabin had dropped softly overboard, and were making for the poop, when I hailed them to stop, covering one with a pistol the while.

He saw that it was of no use, so he asked for a rope directly, and heaving him one, we had him aboard lashed and lying down upon the deck beside his mates in less than no time; but the other one swam on and on, diving down every moment so that I shouldn't hit him. But I could have done it, if I'd liked, though I did not want to shed more blood, so we let him swim on till he began to paddle behind and shout to Van for a rope, when we could hear the cabin windows opening.

'Here, this won't do, sir,' I says; and 'Hi! here, you Sam,' I shouts, 'don't you leave that fore-hatch,' for he was coming away and leaving it unprotected. So he went back; and getting hold of a line, I makes a running noose, and going right aft, I tries to drop it over the fellow's head; but he kept dodging and ducking under, till at last I made a feint, and the water being clear as glass, just as he was coming up again I dropped the noose over his head and one arm, drawing it tight in a moment, and there he was struggling—a harpooned porpoise.

I thought I'd lost him once, for a stroke was made at the line with a cutlash out of one of the cabin lights, but I soon towed him out of reach, when Bill Smith threw him the end of a rope, and we had him aboard too.

Now, what with two wounded men and four prisoners, we had our hands more than full, so after a short bit of consideration, it was decided to risk the opening of the fore-cabin hatch, and make the four men go down one at a time; we, for humanity's sake, keeping the prisoners who were wounded.

So we took the four with their hands lashed, and then with Mr Tomtit only on guard, we four stood ready; and Mr Ward giving the signal, Sam raised the hatch, when one fellow leaped up savage, but I had a marline-spike ready, and down he went again quicker than he came up. Then another tried, but I served him the same, when they stopped that game, and began to fire up the hatch, till I sang out that we were going to send down their mates.

But sending down was one thing, and making them go was another; for the first fellow turned rusty and wouldn't go; till, seeing that half-measures were no good, I nodded to Mr Ward, and he put a pistol to the fellow's ear, and at the same time I gave him just a tap on the head with the marline-spike, when he went down sharp, and the others followed.

Sam clapped the hatch down so quickly that the last chap's head must have felt it; but that put a stop to their firing up at us; and this being done, we felt safer, though none the less compelled to keep a strict watch.

And so the day wore away—not a long day at all—for rather dreading the night as I did, it seemed to come on quickly, and this was the time I felt sure the mutineers would make their attack, perhaps to get the better of us.

At one time I was for taking to the biggest of the two boats left, and leaving them to it; but without provisions, it was like running to meet death, and I was obliged to give up that idea, for, after all, it would only have been to get away till such time as they could overtake us and run us down.

The night turned out bright and starlight; and after making the best arrangements we could for the watch, we patiently waited for any new dangers that might befall us. Even Mr Bell, sick as he was, insisted upon taking his turn at watching, and having now plenty of arms, he sat with his sister by him to guard the fore-hatch, Miss Bell going from time to time to the side, and keeping an eye to the cabin window. Two or three times, too, she came to me, and talked about our position in whispers; and somehow or another she seemed to grow upon one, until I swore to myself that I'd die sooner than the poor lass should be left to the tender mercies of the scoundrels who had seized the ship.

We had two or three false alarms during the night, but that was all; and the next day broke, finding us all half-famished; and now it seemed that either we must attack Van's party in the after-cabin, or one of us must go down and try for some provisions.

Mr Ward said he would go, and he turned towards Miss Bell, as if expecting her to say something, but she never looked his way at all; and after making our arrangements, we lifted the tarpaulin, Mr Ward dropped through, and in a short time handed up to me several tins of preserved meat, some biscuit, and a couple of bottles of wine.

He made four journeys before I heard even a movement in the next cabin, and then there came a muttering as of some one waking from a drunken sleep, and we all made up our minds that, having plenty of rum below, the cabin party had made a drinking night of it.

I never expected to see him up again without a few shots being exchanged; but there he was safe; and after dropping the tarpaulin again, the provisions in moderation were served out, and no meal was ever more welcome. As for the fellows in the fore-cabin, they were evidently well provided, for we heard nothing of them all that day.

Though we swept the horizon again and again, not a sail appeared in sight, so that I was not much surprised to see Miss Bell having a good cry all to herself, when she thought no one could see her; but I did, though I would not let her know that I was looking.

THE SEA-KINGS AT HOME.

THERE was a time in the history of our country when the very mention of Norway spread terror and dismay in the breast of every one, for it was associated with those old Northmen, the Vikings, whose piratical expeditions to this country, and indeed to the whole of Europe, brought so much suffering and misery in their train. Plundering, burning, and killing wherever they came, they used to visit our shores as regularly as the swallow does

Digitized by Google

now. At this lapse of time, however, it is interesting to learn something of the domestic life and manners of these hardy seamen, to whom, indeed, we owe a debt of gratitude, for there is little question that it was mainly owing to them that England became a seafaring country. Mr Barnard * has done good service in laying before the public a short sketch of the life these Norwegian rovers used to lead at home; and we purpose now to give our readers a brief account of their domestic habits—habits which were gradually changed and improved as the old pagan religion gave way to the civilising revolutions produced by the introduction of Christianity.

Like the Spartans of old, the Northmen, in the days when they were pagans, used to expose their children, if they were born deformed, or were more than usually weakly. The object, of course, was to prevent any deterioration in breed, a matter of the last import to a people who valued physical powers so highly. Still, the introduction of Christianity did not, as might be supposed, at once abolish this barbarous custom; indeed, it lingered for some time after in Iceland, where 'the people considered it unjust to be deterred from exposing their children, and at the same time be prevented from eating horse-flesh, which had hitherto been their chief means of subsistence.' The plan generally adopted was to place the infant in a covered grave, and there leave it to die; or else to expose it in some lonely spot where wild beasts would not be likely to find it, and to place some nourishment in its hand, usually a piece of salt pork, for it to suck, so that life might be sustained till, possibly, some compassionate person might find it, and take pity on it.

According to the ideas of the old Northmen, a man ought not to marry for love only, but ought especially to 'secure an independent and honourable position for the future;' consequently, the young men of the period were generally glad to profit by the advice and counsel of their elders. This rule was observed more strictly in the case of the other sex. 'If a girl married without the consent of her parents, her father or relations could disinherit her and her offspring;' consequently, elopements were of rare occurrence in those days. In their courtships, a great many curious customs were observed: the suitor was always accompanied by a spokesman, and in case he was a man of rank, by a suitable retinue, to woo the woman of his choice, a custom which is still observed in many of the country districts of Norway even at the present day. On the day after the wedding, the husband had to give his wife the 'morrowing gift,' a custom which the reader of history will readily recall, for on the morning after the marriage of James I. and Anne of Denmark, the royal bridegroom gave his queen the palace and dominions of Falkland and Dunfermline as her morrowing gift. Amongst other privileges, the right of the husband 'to exchange, bequeath, or give away his wife' deserves notice. Still, the old Sagas mention only one instance where such exchange took place without the previous consent and knowledge of the wives themselves, and in this, one of the ladies, named Sigrid, rather than have anything 'to do with the affair,' went and hung herself in the temple. The authority of the husband over his wife was very great: she could not, for instance, leave her home, even on the plea of visiting her nearest relatives, without his permission. Divorces were of common occurrence among the Northmen, and where both parties wished to separate, they were at perfect liberty to do so. Among other causes for seeking a divorce there was one which, from its peculiarity, deserves especial notice, and this was where one or other of them wore garments which were only worn by the opposite sex; thus, if a man 'wore a shirt which was so much cut out in front that a considerable portion of his breast was exposed,' his wife could claim a divorce; and, on the other hand, if the wife 'went with breeches on,' the husband had a legal claim for separation. In using the phrase at the present day, 'the wife wears the breeches,' people little imagine what serious consequences resulted therefrom some few centuries back.

Hospitality was a great virtue among the old Northmen. No one who stood in need of shelter, no matter whether he was rich or poor, could be refused admittance without the person refusing drawing down on himself the dreadful reproach of being a 'niggardly person.' It was considered incompatible with the laws of hospitality to worm out the stranger's name or inquire into his business. No unpleasant news was allowed to interfere with the mirth of the house while the stranger remained; but the host, like Admetus entertaining Hercules while his wife Alcestis lay dead, had to render his sojourn as agreeable to him as he could. In many cases, these laws of hospitality were carried to ridiculous excess; thus, the Sagas relate that a 'Norwegian woman, Geirrid, who went over to Iceland, and settled there, built her house right across the public road,' and that 'she herself used to sit in the doorway on a chair, and invite all travellers to come in; and that refreshment always stood ready served on a table inside.' But even this profuseness seems to have been surpassed by another Northman, an emigrant to the same country, who built so large a house 'that all persons travelling through the valley where he lived, could pass through it, with their horses and pack-saddles, while victuals stood in readiness for every one.'

In friendship, the old Northmen were as sincere as they were bitter in enmity:

> A friend one shall prove
> To his friend:
> To him, and to his friend.
> But no man
> Shall shew friendship
> To his friend's enemy.

There is no doubt that the Northmen used to drink deeply at their social meetings; indeed, it was especially the business of the women to encourage them to drink. As a natural consequence, quarrelling and fights frequently ensued; and here the women used to render good service, 'for they would catch hold of the most boisterous of the combatants, and throw a cloth over him, to prevent further mischief.' Generally speaking, the parties became reconciled after sleeping their debauch out. Banquets on a large scale would sometimes last for a fortnight, and a chieftain would generally hold three such in the course of a year—namely, at Winter's Night (October 14), Christmas, and Midsummer.

It was a natural consequence of the warlike

* *The Private Life of the Old Northmen*; translated from the Posthumous Works of R. Keyner, late Professor in History at the Royal University in Christiania, by the Rev. M. R. Barnard, author of *Sport in Norway, Life of Thorvaldsen*, &c. Chapman and Hall, 1868.

propensities of the old Northmen that made them esteem everything that tended to make their bodies active and strong, and themselves skilful in the use of weapons. But what will our athletes, and the admirers of 'muscular Christianity' of the present day, say to the following feat, which was held to be a great achievement?—namely, to be able to 'walk on the oar-blades while the boat was being rowed along.' King Olaf Tryggvesson was such an adept at this, that he could throw up three small swords, so that one of them was always in the air, while walking on the oar-blades of a boat in motion.

Both in the pagan as well as in the Christian ages, it was deemed a sacred duty by the Northmen to inter their dead speedily and becomingly. He who neglected to cover a corpse with earth was outlawed. One of the Eddas gives the following directions to be observed:

A hillock should be thrown up
For the departed one;
Hands and head must be washed—
He must be combed and wiped dry
Before he is placed in his coffin,
And a peaceful sleep must be wished him.

Then the 'death-shoes' were fastened on. The individual, usually a near relative or great friend, whose duty it was to wash and lay out the body, did not in these cases advance towards it in front, because it was considered that the glance from a dead man's eye would exercise a baneful effect. Neither was a body carried out of a house in the usual way, but a hole was broken through the wall, so that it could be carried out backwards.

The introduction of Christianity into Norway gradually did away with the old habits and customs of the people; but it was not till the close of the eleventh century, when Olaf Kyrre was king, that any marked changes in morals or manners could be observed. Little by little, however, the change took place; and with 'that hankering after pomp and pageantry, from which the old Northmen even in the very earliest ages had not been entirely free, there was now united a desire to imitate the more comfortable manner of living adopted by southern nations; and thus the domestic habits of the people either underwent a sudden and radical change, or gradually adapted themselves to the pattern from which they were copied.' Thus, it is related in the Sagas of Egil, an Icelander, that when he buried his son Bödvar, who had been drowned, he wore a red fustian tunic, narrow above, and with fastenings at the side, which said 'tunic' split when Egil's frame swelled out, owing to the strong emotion grief at his loss had produced. Egil had resided a great deal in England, and as the style of dress he adopted was strange to the old Northmen, there is no doubt that he had imported the fashion with him. Again, Magnus Barefoot, after his expedition to Scotland and Ireland about the beginning of the twelfth century, introduced into Norway the style of dress used in those countries, and went about with bare legs and a kilt.

The usual time for rising was between four and five o'clock in the morning, and the general time for going to bed was between ten and eleven at night. In the evening, the whole household used to assemble in the *skáli*, or keeping-room, when the women would work, the lads loll on the floor, and the master draw his 'high seat' near the fire. The men folk, especially the old ones, were very fond of baking themselves before the fire, with their clothes off, after which the children would 'rub them down' with rough cloths, an arrangement doubtless very conducive to health. But people of rank frequently indulged in a greater luxury—that is, they would get some of the women to tickle their feet for them till they fell asleep.

The custom to be observed by any one on being presented at court is deserving of notice. First of all, he had to find some one to present him before majesty, and had to dress his head and his beard, and put on his state dress before repairing to the king's quarters. On entering into the king's presence, he had to bow low, and to address him in the following words: 'God give you a good day, Sir King!' The position, too, the person presented had to assume was strictly defined; it was considered the correct thing for him to clasp the left wrist with the right hand, and then let his arms fall into a natural position. Of course, in addressing the king, care had to be taken to use the plural number; while, in speaking of himself, the presentee had to be equally careful to use the singular. Great caution, too, was necessary, in case the king spoke inaudibly, not to ask again with a 'Hah!' or 'Hoh!' or 'What!' but only to say 'Sire?' in an interrogative tone; or, if one preferred using more words: 'Sire, be not angry that I ask again what you said to me, for I did not rightly comprehend.'

Thus, having introduced our Northman into such good company, we will say adieu to him, leaving those who desire to know more of him to consult this curious little book for themselves.

CHANGED.

Dear love, in this rapture of meeting,
While the heart-leaps thrill fast through our veins,
You ask why a shadow of mourning
Like a cloud on my forehead remains?

You say I am altered, my darling,
In these years I have waited and wept,
While the sickening hands of the weary clocks
In slow beats tired, or slept.

The tears that we shed when we parted
Dimmed all the youth out of my eyes,
Till the fair green earth had no freshness to me,
And the sun no heaven in the skies.

The feather-tipped tops of the pine-trees
Are yet bent by the cold winter-blast,
And the laughter and warmth of the summer
Can never make up for the past.

Though the white-thorn blossoms are blowing in May,
And the wheat pierces green through the hill,
Underfoot in the curling bracken
The dead leaves are lingering still.

And the sorrow that left its mark on my youth
Will pass from my forehead never,
Till my brows are smooth in the long last sleep,
And the coffin-lid shut for ever.

POPULAR

LITERATURE, SCIENCE, AND ART

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 278. SATURDAY, APRIL 24, 1869. PRICE 1½*d*.

RIVER-SIDE LONDON.

In spite of the talk about the paucity of gratuitous 'sights' in London, I cannot help thinking that, to a person of the *Homo sum*, &c. turn of mind, there is no other place that offers so many. Wandering through London, you can note the most various manners and customs, and even populations, without the expenditure of a penny, or, at most, by the outlay of a few coppers for 'bus fare. Crushed together within the compass of a few miles, as if for the accommodation of inquisitive but impecunious travellers, 'London' holds a score or two of cities, towns, villages, and hamlets, as different as if they were sundered by hundreds of miles of land, or even sea. Could there, for instance, be a greater contrast, in all that relates to the amenities of life (save for the smoke that impartially blackens aristocratic mansions as well as chemical manufactories), than there is between Belgrave Square and Bow Common? Chelsea and Cheapside, Putney and Petticoat Lane, Dalston Rise and Duke's Place, Moorgate Street and 'the Mint,' Norwood and the New Cut, Hampstead Heath and Hoxton, Stamford Hill and Stepney, Bayswater and Bethnal Green—what similarity, beyond alliterative letters, is there between the coupled localities? There is bustle both in Oxford Street and in Ratcliffe Highway; but how different is the bustle!

In the latter thoroughfare, and the neighbouring docks (even without a tasting-order) a morning may be lounged away, and yet by no means be wasted.

Of all tradesfolk, the Ratcliffe Highway 'naturalist' seems to me to lead the most aristocratic life. Dressed in black broadcloth, with a cable-like gold albert drooping from his glossy, if somewhat greasy black satin vest, and a felt hat, of the kind which clergymen and Fenians have taken it into or on their heads to wear, slouched knowingly above his fat red cheeks, he lolls at the door of his shop, smoking a capital cigar, or choice tobacco in a ponderous meerschaum, clouding into tawny grace, beneath its veil of wash-leather. He puffs away as leisurely as a lord in an aviary. In his windows are golden canaries, drab and jet-mottled mules, diamond-sparrows, wax-bills, milk-white cockatoos for ever setting up their serrated sulphur crests, rosy-throated ashen cockatoos, gray parrots, green parrots, whole colonies in crowded cages of vividly verdant little paroquets. Gorgeous macaws are screaming in the middle of the shop, and striving to untwist the wires that imprison them with the pincers of their lobster-clawlike beaks. Ranged round the walls in dusky dungeons droop moping laughing-jackasses, butcher-birds, herons, ibises, and all kinds of quaint, big-headed, or snake-necked fowl. In his muddy, malodorous back-yard, the naturalist keeps a little menagerie of wild beasts. If you wanted to purchase a hedge-hog to kill the black beetles, or a hyæna as an eccentric pet for your lady-love, he could probably accommodate you with equal readiness. His talk is

> With marineres
> Who come from a far countree—

and it is talk evidently profitable as well as pleasant.

It is strange to see those flashes of tropical plumage through the grimy window-panes of a dingy thoroughfare in East-end London. And here are more reminders of far-distant shores. One window of this little shop is filled with dusty old china—cups, jars, vases, images of dim white, and blue, and pink, and tarnished gold grotesquely shapen, and figured with dragons, and pagodas, and parasol-bearing moon-faces from 'the world before perspective.' In the other, in heaps and rows, lie dusty shells, with dull rainbows playing on their pearly whorls, and varnished emeu and ostrich-eggs converted into silver-rimmed drinking-cups. St George's-in-the-East may seem a strange place to grow sentimental in; but, looking at its *curios*, brought from all parts beyond the seas, you cannot help speculating as to the fates of those who brought them. In hundreds of instances, coral must have been made of the bones of those who have paced these vulgar-seeming flagstones; all over the world, they lie forgotten at the bottom of the Deep.

The pawnbrokers' shops in the Highway are

Digitized by Google

also crammed with suggestive nautical relics—sextants with verdigris on their brass, murderous-looking knives in blue-moulded sheaths, and armouries of rusty revolvers and single and double barreled pistols. Cheaply enough they may be purchased now; one brace of double-barrels is ticketed at six shillings and eightpence. If the weapons could tell of the hands through which they have passed, and foretell the hands through which they are destined to pass, their dull steel might prove a gold mine to a sensational romancer. This old sea-chest, again, tilted up outside on the pavement, has not the prosy look of a box pledged by a landsman; an exciting history (if you could but translate the characters) seems to be written in the many scratches on its faded green paint.

Almost all the shops in the Highway smack somehow of the sea. The tobacconists expose glossy black piles of 'American Negrohead, 3d. an oz.' In the photographers' frames, smart young merchantmen's mates proudly sport their navy-mimicking uniforms; stewards figure in the shore-going gilt-buttoned watch-coats, and house-flagged caps, in which, amongst admiring female friends, they pass themselves off as 'pursers;' grinning tars overcome by the solemnity of the curtained camera, display with gravity their broad collars, shaggy breasts, and hats plastered down on their occiputs; and trios of man-of-war's boys are grouped like Graces with their hands on one another's shoulders. Nautical Almanacs, navigation books, sextants, compasses, barometers, are sold in this shop, with the miniature midshipman in white trousers, or the full-figged and more than full-sized captain in cocked-hat, taking ceaseless observations from its door jamb; in that, green-cased, yellow-lettered signal-lamps are the only wares. In a third, if so disposed, you can buy (just as you might a 'charm' or a watch-key at a silversmith's) an anchor, a ship's wheel, a buoy, a block that might serve for a card-table, or a great coil of tarry cordage that looks like a lump of magnified 'pigtail.' A fourth is black with marline-spikes, and bright with the barbed heads of 'grains' for dolphin and porpoise spearing, to say nothing of a heap of other unfamiliar hardware. Here dangles a row of zinc pails, and there of wooden buckets with rope-handles. Some of the outfitters make a specialty of waterproofs, scenting their neighbourhoods, like a whaler's hold, with blended odours of tar and oil. Stiff as boards, the black garments sway in the wind, with outstretched arms, like the figure over a 'dolly-shop,' or a boy's sketch of his school-master in slate-pencil. The yellow oilskins gleam in the cavernous store like sunlit trees in a dusky grove. Other outfitters offer almost everything that a sailor can want to buy. At the door of the shop, in one arm-chair, lolls the obese, hook-nosed proprietor; opposite him, in another, sits his still fatter and more hook-nosed spouse. Sooth to say, they remind one somehow of bloated spiders in the middle of a cobweb, although the wife *is* sometimes nursing a dirty, hook-nosed, fat baby, with a cooing fondness that contrasts queerly with her business 'cuteness. 'Seamen's Advance Notes Cashed,' is announced in staring capitals on a bill pinned to one of the garments dangling overhead. Every sailor who passes—white, yellow, brown, or black—is accosted as if he were a son, or, at the coldest, a favourite nephew, by the watching couple. That he must want to buy *something* is taken for granted.

Black sea-boots, unblacked 'look-out' boots, woollen stockings, cotton stockings, check shirts, comforters, silk neckerchiefs, cloth trousers, canvas breeches, oilskin breeches, all kinds of waistcoats, jackets, coats, and overcoats, low-crowned shiny hats, straw hats, 'chimney-pots,' Scotch bonnets, sou'-westers with snug flannel-lined flaps, fur caps, plush caps, gold-banded navy caps, pillows and mattresses covered with gay chintz patterns, pots and pannikins as brightly polished as prize tankards, a ring or a watch, a sea-chest or a baccy-box—whatever he pleases—he can take his choice. If he wants a hammock, there is one swinging in the shop, bulged out by a hook-nosed small boy, who peers over the side exactly like Punch. A statistician probably might ascertain the amount of wages paid and advanced to seamen in London; and this, I imagine, would pretty nearly represent the amount of money spent by seamen in London—a large proportion of it in this dirty Highway. The trellis-guarded window of its money-changer's shop is spotted as if patched with all kinds of dirty, flimsy, quaintly charactered foreign notes, and queer greasy bits of battered copper and silver and brassy-looking gold are huddled together in his wooden bowls. Foreign, too, is the aspect of many of the sailors' boarding-houses—the Bremen House, the Prussian Eagle, the German Flag, &c., with red, and white, and blue foreign ensigns, and announcements of *gütiges* entertainment, in yellow German-text, painted upon their panes. It seems at first unaccountable that sailors can find 'pleasure' in sitting and standing in the low cramped bars of these lodging-houses, crowded together like pigs in an Irish packet, in a stifling atmosphere of tobacco-smoke, and the stale fumes of slopped beer and spirits; but after the forecastle, a pigsty, with liberty and unlimited 'lush,' would almost seem a palace to poor silly Jack.

In the Highway, too, he can enjoy at all hours the company of his sirens. Oh, such hideous sirens!—flaunting about bare-headed, in dirty-white muslin and greasy, cheap blue silk, with originally ugly faces horribly seamed with small-pox, and disfigured by vice; eyes freshly black from last night's blow, or circled with the stale rainbow of an ancient bruise. When, according to the local phrase, 'the Highway has woke up' for its never intermitted revelry by night, scenes occur, both in and out of doors, which cannot be spoken of; but even at high noon it is impossible for the most incurious observer to avoid noticing how the sailor is preyed upon by these wretched parasites as they share his pot of porter at the bars, or block his staggering tacks across the pavement. Poor Jack is thought fair game by most of the prowlers in Ratcliffe Highway. It is a comfort to find that anybody cares for him, body or soul. At the end of a side-street, dim capitals announce that the dingy building above which they stand is a seaman's church; and at the bottom of a many-storied warehouse there is a cockpit-like seaman's chapel. To save him, too, from finding his way into Tiger Bay, and afterwards, as accuser or accused, to the police station in queerly named King David Street (few psalms are sung there), a course of evening lectures, according to the bills in the shop-windows, has been projected, to begin and

Digitized by Google

close with a concert by a hundred school-children. As to the daylight amusements which the Highway offers to the sailor, he can play at skittles (most probably with sharpers); he can try his skill in the rifle-gallery, above which a wooden marksman is taking aim at the opposite chimney-pots; or he can assist at the exhibition of wax-work, which shews, as samples, an old-fashioned grandam seated, and a young lady in ball-dress standing, in the window, and advertises, as rich treats within, correct likenesses of the last 'sensation' murderer and his victim. If he had a taste for antiquarian researches, Jack *might* find entertainment in exploring some of the lanes that branch from the Highway. The low-roofed gap that forms the mouth of Seven Star Alley, looks like the entrance to a mere beggar-peopled slum; but go down to the bottom, and you come upon great gates, and a court-yard, and what was once a merchant's handsome house, with a still handsome doorway, now tenanted only as office and foreman's residence of the neighbouring oil and colour works; but merry roysterers, instead of rats and mice, used to make the floors and wainscots of its deserted chambers creak again. And behind, shut in between high walls, like a convent garden, there is a square of hard-trodden cindery soil, dotted with a mangy patch of green that just shews it once was grassed. A flight of rotten 'garden'-stairs droops, like a sadly meditative cab-horse's nose, from a trellised door on the first floor. Within a trellised hen-house, some melancholy draggle-tailed fowls are lugubriously crowing, and clucking, and scratching, as if they wanted to fancy themselves in a farm-yard, but found, like 'the Marchioness' in the Bevis Marks kitchen over her orange-peel and water, that they must 'make-believe *very* hard.' A wide-armed garden-seat, that many a year ago forgot the slimy trace of its last snail, is yawning as if in weariness at having no one to sit upon it. With the black walls for background, a few sheaves of thin, gray, smoke-furred wire—said to be crocus leaves—can be discovered struggling into the light. And, finally, in the middle of the 'garden,' there is actually an old mulberry-tree, pimpled with smutty buds, and reported to bear fruit in its season—from three to four dully dark, wrinkled beads (sometimes, in a very favourable season, even so many as seven) of mingled grit and verjuice.

At the heads of most of the lanes and alleys of the Highway, little knots of dirty, unshaven men are lounging. Some of them, no doubt, are labourers in want of work; but an indefinable and yet immediately recognisable something proves that a good many of them belong to the mysterious order of 'roughs.' One of the many puzzles of London life is the way in which these very peculiar people get their living. Their notions of *meum* and *tuum* may not be strait-laced, but still they do not rank with professional thieves. They have no visible honest means of earning a livelihood, and yet they always seem to have money enough to buy a meal or a pot of beer, or to get a place on board a river-steamer bound to a 'mill' in the marshes. Their life indeed appears to alternate between lolling at street-corners and rushing about to all open-air exhibitions of popular interest—a prize-fight, an execution, a fire, a Hyde Park meeting, or the departure of a police-van freighted with Fenians. How can such a life be lived on an income of L.0 per annum, even though supplemented by the chance earnings of their clumsy amateur dishonesty? The labourers on the look-out for a job are decidedly in the majority in the squalid crowd clustered in front of the main entrance to the London Docks. The self-complacent folks—often in the enjoyment of incomes earned by no exertion of their own—who preach that all poverty is the result of indolence, might, perhaps, not feel quite so confident of the soundness of their theory if they could see the despondent faces of some of these waiters on Providence, standing idle in the market-place, only because no man hath hired them.

Once inside the docks, there is not much lounging to be seen. 'Apply at the Spice Floor,' is roughly chalked on a blue door; long ago the employment thus offered was secured. And a keen eye do the overseers of lading and unlading keep upon their gangs. Small chance of shirking has the dock-labourer. Will he, nill he, he must earn his half-crown *per diem* fairly. At the movable winches, ballasted with paving-stones and pig-iron, on the quays, and at the fixed winches on the decks, perspiring men are straining with a 'Heave—heave—heave all together!' Hydraulic cranes are for ever swaying backwards and forwards over holds, like Titanic fishing-rods whipping for Titanic trout; but what they hook are big boxes and barrels, huge sugar-hogsheads, and twice-pressed wool-bales, seized upon, as soon as they emerge, to undergo a third compression within iron bands—an interlaced chaos of which elastically curves and clashes, and spitefully cuts handlers' fingers, on the wharf. Tea-chests, swathed in matting, or topped with sheet-lead, slide down planks into lighters in a ceaseless avalanche. Here come a dozen men trundling along sulphur-casks, which write their itineraries in the yellow powder they spill, and manifest a most pig-like propensity for blocking up the path, and dodging round all possible corners. Wherever you pass within the shadow of the long, high piles of warehouses, a bundle of sheepskins, a bale, a crate, or a barrel of something, dangles over your head like Damocles's sword.

Everywhere there is bustle. Dwarfed by the lofty spars and buildings, the men look like emmets in their fuss. Chief-mates, with weather-dimmed house-flags on their caps, and attired in gilt-buttoned, long-skirted blue overcoats, very white at the elbows and the seams, are hurrying about with pens behind their ears; or sit at rough tables checking off cargo, opposite landsman-clerks, who look sceptical as to the accuracy of nautical arithmetic. Other scribes are scribbling away as if for their life, in locomotive wooden offices like wheeled sentry-boxes. In this long shed (what a splendid ballroom it would make!), half-a-dozen men are vigorously battle-axeing sugar-hogsheads, like Crusaders pitching into Paynims. Outside, a band of white-frocked coopers keep up a constant clatter, as they hammer down their wedges on the hoops of casks curiously scored with arabesques in crayon. Yonder, a man with an ink-bottle slung from his button-hole, pen behind his ear, scroll of paper in one hand, and a mysterious instrument like a shoemaker's magnified measure in the other, is buzzing about barrels like a blue-bottle. In and out of the customs-offices people pop like bees at the mouth of a hive. The only persons who seem to take things easily in the docks are the

Digitized by Google

dock-constables, strolling about like park-rangers; passengers in search of ships, getting their toes trodden on as they gape at the ship-cards nailed to the sheds or the ship-placards lashed to the shrouds, and wandering about decks, and diving into cabins in a bewildered dream; the men scraping, and washing, and painting the ships' sides, meanwhile chatting in lazy polyglot upon their swinging stages; and the cooks at the galleys wiping out dishes, and superintending the boiling of their bubbling strong-scented messes.

The nose is powerfully appealed to in the docks. The fundamental perfume is a mixture of tar and bilge-water; but superinduced on that there is now the sweet scent of sugar; now the sour scent of vinegar; now the fat or rancid smell of oil or grease; now the fetid smell of fermenting sheep-skins, hides, and horns; now the aromatic or pill-suggesting scent of drugs; now the moist scent of paint; and now the dry scent of seeds piled up in sheds like coal. Snuff seems floating in the air as you pass the vast Tobacco Warehouse, covering more ground than a good many Irish farms; and in spite of their *al fresco* position, you are reminded of a steamboat's cabin and steward's pantry when you wander through scores of casks branded Cognac. It is curious to reflect that one is walking over miles of port and sherry, a subterranean town of wine, in whose dark fungus-tapestried avenues dim lights are flitting about like marsh-meteors. The orderless roamer in the docks cannot help wishing that he could find his way down one of the well-like shafts that open here and there, and join the tasters who are jollifying in that Bacchic Hades, with auger-bearing coopers for Ganymedes.

Daylight wandering in the docks, however, is not free from adventure. A drawbridge may split in halves as you cross it; the narrow space between shed and water along the quays and jetty is so choked with cargo, wood-stacks, heaps of metal—so crossed with gangways, over which you must jump, or under which you must creep—so encumbered with chains and hawsers that trip you up, and iron rings against which you break your shins, and so crowded with pushing and pulling porters, that, if you do not look sharp, you may take an involuntary header in the brown-green basins—no very inviting baths, although even from their viscous surface the sunlight flashes upwards, and plays in golden ripples on black bows, and rudder-posts, and quarters. A plentiful supply of drags is hung along the walls, in readiness for any such mishap; but their meat-hook-like appendages suggest the thought that if they fished you up—say, by your nose, drowning might almost be preferable to such salvation.

It is a jumbled but a picturesque sight which offers itself as you ramble from basin to basin: now crossing a capstaned drawbridge—now diving through a tunnel—now darting from gate to gate, athwart an intersecting lane, like a rabbit from hole to hole, over a bridge iron-latticed to prevent drunken or desperate East-enders from ending their misery by a leap from its railings: warehouses crammed with wealth, squalid cottages with patched panes, church towers, chimney-pots, inextricably mixed up with shipping; a forest of masts, with here and there a topsail bellying in the sunlight, or a curvilinear row of sailors' frocks and trousers hung out to dry, or a house-flag fluttering from a mast-head, or a white ensign from a peak, like an almond blossom on a leafless bough; ships with white streaks, ships with blue streaks, ships with no streaks; ships with peaked yards, ships with squared yards; ships with square sterns, ships with round sterns; wooden ships towering like castles, low rusty iron ships that look like floating coffins; clipper ships, with razor-bows, gilt suns or lions' faces on their cat-heads, scoured brass belaying-pins gleaming like polished gold, white-painted masts, and flush decks, holy-stoned as clean and as bare—save for Catharine-wheel-like coils of artistically 'flemished' cordage—as a just-washed china plate, scornfully turning up their jib-booms at the black lighters and the water-logged barge lumbering alongside; and old-fashioned ships (clustered together in an outer basin, as if ashamed of themselves), with stems as bluff as their sterns, blisters on their black paint, rusty stains upon their white, rusty anchors digging their fangs into their battered bows, meagre little spars as out of proportion to their hulls as Punch's legs to his humped back, splintered, wave-worn oars lashed askew to their gray ravelled shrouds, and a cramped waist that is a tar-streaked, grease-spotted chaos of boats, buckets, tarpaulin, tilted hatches, patched sails, and tangled 'slack' of halyards.

In the docks, foreign lands are *brought home* to one, as when we read upon the stern of a Flemish ship *Antwerpen*, or of a Spanish, *Sevilla*. The latter is the wedge-bowed, Clyde-built steamer *Velasquez*, with a canny Scotch mate, but a sprinkling of Spanish sailors amongst her crew, who, saving their bushy black beards, look so much, as they shew their white teeth, like merry mulattos, that it seems easy to understand how—once, at anyrate—the Spaniards, as Mr Merivale writes, were 'the most humane among all European slave-owners.' Yonder, carpet-bag in hand, a snub-nosed English mate, with a stubbly straw-coloured moustache, and a tallow-candle complexion and creased uniform, that seem to tell of 'turning in, all standing,' on a sofa, at ever-so-much o'clock, after a last Cider-cellars' spree ashore, is hurrying towards an Italian steamer, surrounded by full and empty coal-lighters, that will go out in a few hours through the 'Wapping entrance,' bound for Palermo and Messina; but over her forecastle bulwarks lounges a classically featured, Vandyke-bearded, darkly pale Italian mariner, who might sit for a model of a Calabrian brigand, calculating whether he should cut off another ear to hasten the payment of his captive's ransom. In the main basin lies the screw *Britannia*, so down by the stern that she almost lifts the sea-greened copper of her fore-foot bodily out of the water. The shipping-clerk who is bawling and gesticulating forward over the unpainted wooden rail that serves for bulwarks, looks like a candidate for parliamentary honours harangning his desired constituents from very lofty hustings. She must make haste to get in trim, since she is advertised in the *Times* to sail for Lisbon and Gibraltar to-morrow morning. Alongside of the jetty lies the *Caranjah* for Adelaide; and astern of her, the *Spirit of the Age* for Victoria, Vancouver's Island. The *Verulam* is laid on for Port Natal. The *Charles* clipper, on whose deck the diluted London sunlight is so lazily sleeping, will have to battle through the 'roaring forties,' and round the Horn, before she can glide through the Golden Gate into San Francisco. The *Abbotsford*

Digitized by Google

is bound for Brisbane in our own Pacific-washed Dorado. A huge three-master, with 'Windsor, N.S.' upon her stern, makes one proud of the ship-building skill of our Blue-nose cousins. Hard by, there is a ship for Boston, opposite her a Scotch tea-clipper, and in the same tier the New York liner *Constantine*. A 'Moodian' mate, with a complexion like a blighted lemon, is drawlingly yarning with an invalided soldier on board the brig *Romaine*. She seems to be superciliously sulking in the dirty waters of St George's-in-the-East. When she returns to her cedar-shaded St George's-in-the-West, a negro pilot will sit astride upon her bowsprit, and so guide her into harbour, through tortuous channels of deep blue and green water, as transparent as glass, fringed with glossy black 'sea-rods,' and groves of fantastically twisted white coral. Next to her is a piratical-looking three-masted schooner laid on for Pernambuco; a battered little brigantine bound for Aspinwall: and whilst you are thinking that you would as soon attempt to cross the Atlantic in a basket as in her, a grizzled old Russian sailor, in a high-domed black sheepskin cap, brushes past you, chatting in broken English with a fat and fluent old Cockney landlady, who has come to claim him once more for her airy lodgings in Rosemary Lane.

BROTHERHOODS.

From the earliest ages, great minds have conceived the idea of human fraternity: this instinct becomes a light which shines through every page of the Gospel. He who relates the story of the traveller who fell among thieves, meeting with the disdain of the priest and the assistance of the Samaritan, placed the charitable and warm-hearted heretic above the indifferent man of orthodox sentiments; and divinely taught us, nearly two thousand years ago, that humanity takes precedence of everything in the eye of our common Father. If men have profited little by this teaching, it is that the spirit of egotism and pride is so difficult to root out of the human heart; and since no institution has realised in its full extent the doctrine of the parable, it only proves that Christianity is far from having exhausted its treasures and ended its task. As it was impossible that one society should embrace all races, private guilds, brotherhoods, or societies have been constantly formed, each drawing up its own code of principles, manners, and distinct interests; hence arose the antagonism of country and religion, with many other obstacles to the dream of universal brotherhood; and though the hopes of enthusiasts have been oftentimes disappointed, the institutions have had their advantages, especially in an unsettled state of society.

Europe, in its transition period during the middle ages, presents a picture of life and property under the most uncertain tenure; thus we find communities of individuals everywhere springing up. Religious men thought they increased their devotional feelings by forming monastic establishments; the knights, who maintained the laws of chivalry, each chose a brother-in-arms, who was bound to defend his friend in all the dangers of warfare; the citizens, in their various trades, joined themselves into guilds, to protect their rights; individuality was merged in exclusive associations and separation from the mass. The trade guilds have indeed a very ancient origin, dating back to a period before the spread of Christianity. Germany has always encouraged them, and the Free Towns gradually rose in importance, by the power they possessed of defending their citizens from the harsh oppression and injustice of the nobles. Numbers flocked within their walls; trade was encouraged by security; and every citizen enrolled himself in one company or another. All free-born men, irreproachable in conduct, and instructed in any craft, enjoyed equal rights, and regarded each other as brethren. One was chosen to be the head master or alderman, and any business belonging to the welfare of the whole was freely discussed. Thus the meetings acquired a very convivial character; the members drank their fill of Rhenish wine or German beer, and entertained each other with bacchanalian or warlike songs, which had come down from the days of the Vikings. The church stepped in at length, and proposed hymns instead of these heathenish ditties, establishing religious services for each separate guild—a custom still retained by such brotherhoods as the Odd Fellows and Foresters in England. The guilds became extremely popular, and crowned heads were often enrolled among the members at their own request, by which they were made amenable to all the laws of true brotherhood, and taught lessons of justice, such as they were little accustomed to. Thus it happened that a prince in Slesvig, having killed one of the guild to which he belonged, was so imprudent as to enter the town when travelling. His attendants warned him of the danger, when he haughtily replied, that he was not afraid of a wretched association of tanners and cobblers. They, however, rose as one man, sounded the tocsin, and, protected by their privileges, put the prince to death, and killed those of his followers who attempted any defence. In London, the Easterlings, or Emperor's men, formed the first of these guilds as early as the days of Ethelred, becoming a powerful company under the Plantagenets. Their house was in Thames Street, with a wharf on the river, at which their ships could freely load and unload: it was defended by stout walls, which had to bear many a brunt of battle from the jealousy of the London mobs, led by the 'prentices.' Here they lived in common, each having a separate cell, and were kept under the strictest regulations. Celibacy was a *sine qud non*, any infringement of the rule being followed by expulsion; not even a housekeeper was admitted into the establishment, and the worthy merchants had to make their own beds. These arrangements were not general to other guilds, but arose from the members living in a foreign land, where great secrecy as to their interests was necessary.

In the days when writing was an accomplishment known to few, it became a common custom for buyers and sellers to resort to the evening meetings of a guild, and there, in the presence of respectable witnesses, the bargain, after much time and ale had been consumed, was struck. The *leth kop*, or closing cup, was drunk, and the bond was felt to be as binding as if the lawyers themselves had drawn up the deeds and covenants. If, too, any serious crime had been committed in the neighbourhood, the officers of justice called upon the members of the guild to assist them in the search for the culprit—an amateur constableship which was never declined.

Esteem and mutual confidence often gave rise to what was called a brotherhood of arms, in which honour alone was the object, as it gave no right of succession to property. The way in which it was contracted varied with the manners more or less refined of different nations. The knights of Constantinople, when they allied themselves with the French crusaders, made a dog pass between them, which they cut in two with their sabres, saying that thus should those be treated who failed in their engagement. The Irish are said to have observed this custom in the thirteenth century, as well as one still more horrible, which was that of mixing the blood of each of the contracting parties with wine: this they drank, saying that they were now brothers by blood. Alberic, Count of Tripoli, sealed his treaty with the Saracen sultan by submitting to this barbarous ceremony, as well as the vassals of the Lord of Toucy with the French. The ordinary practice of the Anglo-Saxons was to strike their shields or lances one against the other as a sign of amity; whilst others exchanged arms, being persuaded that they could give no greater mark of friendship than parting with what they held so dear. Christianity, whilst abolishing these superstitious ceremonies, introduced a fraternity which was made before the altar in the presence of a priest, who recited some prayers composed for the occasion. The new brothers then confirmed their alliance by a solemn oath sworn on the Gospels, and by receiving the wafer, broken in two, as a witness of their engagement, signifying that whoever failed in the fraternal union, should thus be divided from Jesus Christ. In one of the many quarrels which arose between the rival Houses of Orleans and Burgundy, an agreement was at last brought about, and the two princes went to church, heard mass, and received the sacrament, swearing brotherly love and fraternity. There is still a deed extant in Paris whereby Louis XI. 'takes Charles the Bold, Duke of Burgundy, for his only brother-in-arms, to assist, support, and favour him against any man living, swearing the same on his body, his honour, and his word as a king.' Another treaty, not less curious, was that between Bertrand du Guesclin and Olivier de Clisson, two of the bravest knights of France: it formally explained what was intended by fraternity of arms. They were never to abandon each other, whatever might be the peril; to maintain each other's property against all attacks; to defend their mutual honour, and take up any gage of battle, if one should die before completing it. The only exception made was to the king of France, his brothers, and the lords to whom they owed fealty. Even the ladies, in those chivalric days, could not claim the protection of a knight, if his duty called him to flee to his brother's help. Their enemies were also in common. The Duke de Bourbon carried this delicacy of feeling so far as to refuse a considerable sum of money from the king of Castile, for the simple reason that he was the enemy of Boucicaut, his brother. When no extraordinary service retained them in the king's employ, they associated themselves together, to drive the brigands from a province, to deliver distant nations from the Infidels, to dethrone a usurper, or, still more frequently, to assist oppressed damsels. De Boucicaut had been so ashamed of the number of ladies who, having lost their lands during the wars, were obliged to bring their complaints in person to the throne, that he formed a brotherhood of thirteen knights, who, for five years, devoted themselves to the defence of all ladies who requested their help. Each bore on his arm a golden crown with a green enamelled ground, on which was engraven the face of a fair lady; thus their association was called the 'Chevaliers de la blanche dame à l'écu vert.'

The plague which devastated Europe in the fourteenth century, drew many people together for brotherhoods of charity. So few were found willing to bury the infected corpses, that some good people of all ranks joined themselves into a society to attend on the sick, relieve their sufferings, and watch over their decent interment. The gratitude of their fellow-countrymen poured contributions into their laps; and at the tolling of a bell, each member was ready to do his appointed service, either of nursing, giving clothing to the needy, or carrying the invalid to the hospital or the grave. In many parts of Italy and France, this brotherhood may still be met with, dressed in a long black cloak and hood, with holes cut out for the eyes; they pass you silently in the street on their errands of mercy, or shake the alms-box they carry as a petition for a small contribution.

Very different to this was another association of about the same period, which ended in wretchedness and misery. A wild Hungarian impostor, an apostate from the monks of Citeaux, set out on a preaching mission, and soon received into his brotherhood thousands of the populace. His long white beard descending to his waist, his pale thin cheeks and deep-set brilliant eyes, his voice of thunder, and the flow of tears which he had at command, gave him the appearance of a penitent; and the lower orders believed him when he declared himself sent by God and favoured with visions of angels. He divided his followers into companies, under different chiefs, with five hundred banners, on which were represented the cross, the Lamb, and the visions of the prophet; they were all armed, and formed a most formidable band. The chiefs, although laymen, heard confession, gave remission, cancelled marriages, and preached whatever they pleased. Their declamations were chiefly directed against the clergy and the monks, whom they painted in the worst of colours; a kind of satire which highly delighted the lower orders. It is computed that thirty thousand joined their ranks in Flanders alone. Amiens and Paris received the prophet with open arms; but when the fraternity saw themselves multiplying so rapidly, they grew audacious, pillaged the villages, and killed ecclesiastics and laymen. It was time for the government to interfere. At Bourges, the people defended themselves; many were killed, some hung by order of the magistrates, and the rest dissipated like a cloud of smoke—returning, as it seemed, to their flocks and the plough. Such was the miserable end of the Pastoureaux. In the baggage of the leaders were found a quantity of money, powders of a poisonous nature, and some letters written in Arabic, engaging to deliver up a large number of Christians to the Saracens.

It would scarcely be just to omit all notice of one of the greatest of the military guilds, which exercised immense influence over the civilised world for nearly two centuries, that of the Knights Templars. The chivalrous bravery of its members, the romantic end they set themselves to accomplish

Digitized by Google

—namely, the recovery of the tomb of Christ from the hands of the Infidels—the immense possessions they acquired, and their tragic doom, have always excited the interest and pity of the world, and blinded it to their rapacity, cruelty, and pride. Hugh de Payens and Geoffrey St Omer, uniting to themselves six other knights, in the year 1118, formed the nucleus of the society, taking the vows of obedience, poverty, and chastity. A house, supposed to have been on the site of Solomon's Temple, was granted to them by Baldwin II., the king of Jerusalem; and here they agreed to live, in the greatest simplicity, for the protection of the pilgrims who travelled to the Holy Land. None but those of noble birth were admitted; and as at first they proved themselves courageous and self-denying, their supporters became very numerous, and that most eloquent of monks, Bernard, Abbot of Clairvaux, who roused Europe to a crusade, espoused their cause. By his help they received the sanction of the pope, and he assisted in drawing up a code of laws for their body. Never did they forget their duty as soldiers—to die rather than be conquered was their motto. They carried out the idea of fraternity with the most generous self-sacrifice, and ran the greatest risks to save a brother in danger. The initiation of the candidate was strictly secret; he was led into the conclave, and informed as to the rules of the order, when an oath was administered, and a white mantle, ornamented with a red cross, thrown over his shoulders. The same colours were adopted for their famous banner Beauséant, which became their battle-cry; many a fierce charge was made in its name, and the very sound caused Saladin and his warriors to tremble. At length, they were permitted by the pope to have a separate order of priests, which probably led to their ruin, on the charge of heresy. The frequent communication they held with Eastern nations, induced many to share in the secrets of those countries regarding magic and alchemy; and though it is impossible to believe in the ridiculous accusations made against them, we may at least gather that there was great laxity and free-thinking among them: enlightenment, which was then a dangerous enemy to the church, found a home there, with much religious indifference. Their great persecutor, Philip IV. of France, accomplished their destruction. The Grand-master and many others were burned alive in Paris, refusing the pardon which was offered if they would confess their crimes. The former ascended the scaffold, and said: 'The decree which condemns us is an unjust one; we die innocent; but there is in heaven an august tribunal where the oppressed never implore in vain; to that tribunal I cite thee, O Roman pontiff: within forty days shalt thou be there. And thee, O Philip, my master and my king, in vain do I pardon thee; thy life is condemned within the year: I await thee before God's throne.' Such a citation was not uncommon in the middle ages. In this case, the pope and the king died within the time specified.

But by far the greatest of the brotherhoods is that of the Freemasons; whether we look at its *long* existence, its widespread influence, or the grandeur of the principles it professes. Born and carried on in mystery, its secret is still supposed to be inviolate, though there are some of the uninitiated who profanely declare that they know it. It is impossible to say when it first sprang into existence; a curious old legend refers us back to the four children of Lamech who invented all the sciences; those of geometry and architecture being transmitted through Nimrod to Abraham, and from him, when he went down into Egypt, to a worthy scholar 'that was height Ewclyde.' It seems that the country was over-populated, and the lords could no longer afford establishments for their sons, so they issued a proclamation for some man to teach them a gentlemanly livelihood. Euclid undertook the task; geometry was carried into practice, and architecture became the fashion; the brotherhood of masons was established, and when Solomon reigned, he was Grand-master over three thousand. These spread over other countries, and Edwin of England was the first to draw up their rules in a book, and form a society. Other attempts have been made to refer their origin to the followers of Pythagoras, the Essenes, or the Knights Templars; but the only reasonable supposition is that they spring from the Stein-metzen of the middle ages.

The passion for building churches and monasteries, especially fostered by the Benedictine and Cistercian monks, drew around them colonies of various handicrafts; these requiring discipline, formed themselves after the fashion of their superiors into lay brotherhoods, who were taught that by working lovingly together, the highest style of thought would be elicited, and the spirit of piety and concord might be reflected even in the heavy masses of stone with which they had to deal. Thus arose the symbolism of Gothic architecture, which was to be a hymn of praise to the Deity; with its lofty spire pointing up to heaven, grand in its object, and full of meaning in every detail. Strasbourg formed the headquarters of the society, its cathedral being considered their masterpiece, the foundation so strong that it has stood the storms of centuries, and the carving of the spire so light that it may be compared to a piece of lace. It became the custom for those kings who wished to decorate their capitals with these exquisite specimens of Gothic architecture, to send to Strasbourg for the pupils of the masons to direct the work; thus the cathedrals of Cologne, Zürich, Fribourg, Vienna, and many others on the continent and in England, were built. The celebrated philosopher, Albertus Magnus, who resided at Cologne in 1249, was himself a mason, and drew up a symbolic code of rules for the practice of the art, in order to keep their secrets from the unlearned, and facilitate the work of those who understood the figures. The members of the Ban-hutten, or building-clubs, refused any communication with the ordinary mason, considering themselves very much his superiors. They had their special signs of recognition and secret ceremonies, each one being bound by oath to observe the guild laws; they divided themselves into masters, companions, and apprentices; took the square, the level, and the compasses for their sign; and endeavoured to erect in themselves a spiritual temple, having for its end the attainment of the threefold gifts of light, truth, and virtue.

When the apprentice had served his time, and was anxious to be admitted into the fraternity, a proof was required as to his birth and capacity of body and mind; a sign was then given him, which he was to cut into every work of masonry in which

Digitized by Google

he shared. An assembly of unarmed members was called together; the candidate was proposed, and a messenger sent to fetch him. In imitation of an old heathen custom, he was desired to assume the attitude of a suppliant; half his garments were taken away; and with his eyes bound, his breast and left foot bare, he stood at the door of the hall and gave three distinct knocks. A warden led him in to the master, who made him kneel and repeat a prayer; then he was taken three times round the hall, halting at last with his feet in a right angle and opposite the master. Between the two lay a New Testament open on the table, a pair of compasses, and a mason's square, over which he stretched out his right hand, and swore fidelity to his duties and secrets. The manner of knocking and the gripe of the hand were the same as those now used in freemasonry. A banquet always succeeded the initiation; the welcome cup was drunk with three times three; it was taken hold of with a glove, the cover lifted, and lastly carried to the lips, when it was emptied in three separate draughts, and replaced on the table with three different motions. They also learned the mystical numbers: 3, 5, 7, 9 being especially sacred; as were also the colours gold and azure, which bore a symbolic allusion to their art; and white, to their secret association. The interlaced cord on their portals has reference to these.

Our English king, Edward III., perceiving the advantages of these societies, encouraged them by his patronage; he engaged the master of 'Giblim' to rebuild St George's Chapel; and in the following reign, William of Wykeham, also in close connection with the masons, rebuilt Westminster Hall. It seems probable that, in course of time, the guilds began to consider their private code of laws higher than that of the realm, and became refractory subjects; for Henry VI. forbade all meetings of masons; nor were they revived until 1607, when the Earl of Pembroke, a nobleman of great taste, set out on a continental tour with Inigo Jones the architect. They returned to their native country inspired with the chefs-d'œuvre of Italian architecture, and longing to improve the style of their own country. With the consent of the king, the lodges were again regularly constituted, and he was elected patron: a change gradually came over the admissions, which were no longer confined to that particular handicraft; any person who desired it was made a member. A century after, the entire separation of the Freemasons from the operative guilds was fully carried out, and the brotherhood became symbolic only in its building; professing to be engaged on the temple of the heart, and the improvement of the world by its enlightenment. Its after-history, in detail, would be only tedious; but in tracing the brotherhood of the Illuminés, that of the Freemasons will be seen to be intimately connected with it.

The eighteenth century was a most fruitful one for all kinds of secret fraternities, including curious rites involving the idea of an important secret. They took amazingly with the Germans, and thousands of men joined the ranks. One, which was ushered into the world in the most serious manner by the young lawyers of Wetzlar, had no name; an excellent way, they said, of preventing any attacks of justice, and defying all their enemies. The various steps of initiation were equally anonymous, that is to say, they were represented by abstract designations. The first, at the foot of the ladder, was called *transition;* then, *transition from transition;* and thirdly, the *transition of transition towards transition.* Such were their puerile subtleties; which, had they not been attested by the impartial historians of the time, would be considered as ridiculous inventions. The suppression of the order of the Jesuits in 1773 largely increased the importance of these orders. Having lost the power of ruling in one way, they were impatient to seize it in another; and no longer able to meddle with temporal affairs under the mask of religion, they took up with freemasonry. In a very short time, those of the Bavarian Jesuits who were men of action and intrigue swarmed in all the lodges, and the whole of Southern Germany would have been transformed into a vast Jesuitical association, had not the men of the north uttered a cry of alarm to rouse the careless. Nicolaï, a well-known author, and a man of scrupulous honesty, traversed Bavaria, Austria, and Würtemberg, unmasking the enemy and exciting distrust. The weakening of Christian belief, and the dryness of that philosophy which prevailed all over the continent in the last century, had opened the way to every kind of superstition; the old brotherhoods of the middle ages, the Rosicrucians, the Templars, and many others, were revived; and such was the mania, that some members of the Protestant clergy were united to the Rosicrucians, and actually became Catholics before they had time to think of what they were doing.

In the midst of this confusion, it was reserved for an old disciple of the Jesuits, and their implacable enemy, to defeat their manœuvres. A young lawyer, Adam Weisshaupt, of Ingolstadt, had been one of their pupils for many years; their tuition inspiring him with the most invincible repugnance; when, a few months after their suppression, he was appointed to a professor's chair in the university, which had been held for ninety years past by the order of Jesus. He was naturally the object of endless calumnies, but these private slanders could scarcely account for his conception of the society of *Illuminés;* it was rather the sudden, widespread, and mysterious agitation produced in the secret societies of Germany by the Jesuits, and the fear which this agitation, increased by public rumour, inspired in a man who well knew their power. Though without experience, knowledge of the world, or powerful friends, Weisshaupt determined to be an Ignatius Loyola of the philosophy and intelligence of the eighteenth century. An officer of the name of Ecker had just established a lodge of Freemasons in a neighbouring town, where alchemy, magic mirrors, and the raising of spirits were working wonders. He came to Ingolstadt to recruit his ranks, seeking his adepts among the very men whom Weisshaupt was trying to educate to his standard. Destined to oppose the influence of the Jesuits, was he to see them led away by the miserable and foolish practices which offered such scope to the intrigues of his enemies? He unveiled his plan, his secret, and his hopes to the most suitable of the students, and the society of the Illuminés was founded, to become the terror of the old despotic governments. For about four years it spread no farther than the neighbouring towns; but in 1780, the admission of a young Hanoverian gentleman, the

Digitized by Google

Baron de Knigge, changed the scene of operations, and the continent was opened to the conquerors. Knigge was of a volatile spirit and full of enthusiasm; he assisted Weisshaupt to remodel the whole organisation of the society, established degrees of rank, instituted ceremonies, and determined for each their duties and rights. Its pretensions were, to raise the poor and humble, and cast down the haughty; to create a new world by morality and equality. Books written in the spirit of the Gospel, mixed up with the doctrines of Rousseau and the Stoics, were to be the chief agents of the revolution. The visionaries had the most ardent belief in the age, if practically and religiously taught; every member was to become the apostle of this faith. 'Ite et docete' was the motto; and they were persuaded that in the second generation an army of disciples would be constituted under one high pontiff, who would possess the government of minds, as well as the direction of temporal matters. Knigge travelled from lodge to lodge, and soon almost all the Freemasons joined the Illuminés; princes even, in their hatred of Jesuitism, inscribed their names on the rolls. The progress was immense; one recruit brought another, and in a very few years all the north of Germany, Scandinavia, and even Russia, were under the influence. One of the most useful converts was Bode, a celebrated writer and friend of Lessing; he became one of the leaders in the society, but pronounced it 'a system which, if it fell into the hands of badly disposed men, would cause misery to the human race, but if governed by men of wisdom might do much good.' It was, in fact, nothing but an introduction to Jacobinism; imposing virtue by means of a dictatorship—hidden, unknown, and irresponsible—which reached its fearful climax some years later in the hands of Robespierre and St Just.

But this society was not destined to last. In 1784, it became the subject of a violent proscription in the name of the Elector of Bavaria. The Jesuits had circumvented it; some members had taken flight, and betrayed it; Weisshaupt and Knigge had quarrelled on the subject of pre-eminence, and Bode withdrew. The following year, a general storm burst out; universal terror was inspired by the name Illuminé, and persecution of its members was the result. Weisshaupt fled, but found an asylum with one of the sect, Duke Ernest of Saxe-Gotha. Every crime was imputed to them by the narrow-minded conservatives: it was they who had laid the match to the powder, and brought on the French Revolution. When Gustavus III. fell under the pistol of Ankerstrom, the crime was attributed to 'the Illuminés, who were the assassins of kings, the destroyers of empires.' Their aim, it was stated, was to govern the world, appropriate the sovereign authority, usurping the place of a king, whilst leaving him the barren honour of wearing a crown; they had adopted the blind obedience of the Jesuits with the principles of the regicides of the seventeenth century; the proofs and exterior ceremonies of freemasonry; the raising of spirits, and incredible audacity of the Templars. Such was the state of feeling at the time. No doubt it was much exaggerated. But happily the time for secret societies was passing away; the light of liberty was to dawn on the world, and each man would be left free to hold his own opinion. Let us give the founders of such societies their due: they were generally men of great sincerity and earnestness of purpose, longing to regenerate the world, and create an earthly paradise founded on a mixture of Christian submission and philosophy. As such, they reveal a curious aspect of European society in the eighteenth century.

ABOARD THE SEA-MEW.

IN TWENTY-TWO CHAPTERS.—CHAPTER XVII.

Now you might have thought that, under all circumstances, these four passengers would have been as thick as possible together; but no; Mr Bell seemed to have an idea of what Mr Ward's feelings were, and though polite and pleasant, that was all; and though Miss Bell never shewed a sign of giving him a friendly look, I couldn't help thinking that she did not quite dislike the young doctor.

That evening we had an ambassador from the fore-cabin in the shape of the fat passenger, who brought a message to say that they wanted water below. We let him come up after they had knocked at the hatch for some time, but all we could do was to pass him on with the message to Van, who swore out something, but would give no further answer; while as to going back, the messenger would not think of that, so that our force was strengthened, so Mr Ward said, but I only thought of the meat tins and biscuit.

Night again, and we set our watch, wondering whether we should get through it alive, for it was like living over one of those volcanoes, I thought. There might be an explosion at any time; and though I wouldn't make any show of my trouble, I was a good deal worried; and as for them as had been wounded, they seemed suffering as much as me.

Mr Ward had the first watch, with Bill Smith and Mr Tomtit; and when he woke me up, it was from a pleasant dream of home. But he reported all right; and with Sam Brown and Mr Bell for my mates, we began the second watch.

I said Mr Bell, but really it was his sister, for the poor chap seemed to me to be sinking, though, with the bravest of hearts, he fought against all of it, and held up to the last.

I'd been talking cheerfully to Miss Bell about there being safe to be a vessel cross our course next day, when suddenly she seized my hand, held it tightly, and pointed to something rising slowly up from the cabin skylight. Sam Brown must have seen it at the same moment, for he left the wheel, and the vessel fell off before the wind.

'What's that?' whispered Miss Bell; and do you think I could speak? Not a word; for there, slowly making itself known, was an enemy which I had never counted upon seeing, and I couldn't help giving a groan, as I felt that now we should be beaten indeed.

Accident, or done on purpose, I could not tell, but the ship was on fire, and the smoke rising in a steady column rolling slowly up, while I had hardly roused up the sleeping men, before, with a shout, Van, closely followed by Brassey and the other two, came over the poop on to the deck.

Fighting seemed no good, after what was taking place before us: our enmity seeming quite small now before this trouble, and besides what was the

Digitized by Google

use of having a struggle for what would probably be burned to the water's edge in the course of an hour or two; so giving way, we slowly backed up into the fore-part of the ship, leaving the mutineers free to act as they pleased.

It was a bad plan, for the first thing they did was to loosen the men in the forksle, when out they came yelling and savage, but only to stand and stare for a few moments at the smoke rolling up through the tarpaulin, which now began to blaze.

That it was an accident, was now plain enough, for, taking no notice of us, they began, in a hurried sort of way, to draw buckets of water and throw over it; then two men got to one of the pumps, but what they did seemed a mere nothing, and then a panic seemed to seize them, and throwing down the buckets, they began busily to get one of the boats ready, throwing in a compass and anything they could lay hands on, some fetching rum and biscuit up out of the cabin, and all in a hurried frightened way, as if not a moment was to be lost, and they might expect the ship to blow up any minute.

All at once Mr Ward darts forward, shouting: 'Lend a hand here, and we shall save her yet!' and for the next quarter of an hour no one would have thought there had been a mutiny, for we were all working away side by side against what was an enemy to both parties; and bucket after bucket was poured into the burning hole, but with no more effect than if the buckets had been thimbles.

The fire and smoke came rolling up, and rising higher and higher, while, as if to fan the flames, a sharp wind blew seemingly from all four quarters at once, making the flames roar again; and first one and then another threw his bucket into the fire, and began running below for provisions to put in the two boats.

I think Mr Ward was the last man to drop his bucket, and that was when the flames had risen and risen in a column of fire to lick the rigging, and then began leaping from rope to rope and sail to sail, till the mizzen was one blaze of light, brightening the sea far and wide, till it looked like so much golden oil, without a ripple upon it anywhere.

They soon had one boat lowered, and were busy over the other, getting in everything that they thought would be useful, we all helping; and it was in this boat that Van seemed to intend going, for, letting Brassey take charge of the other, and telling him to push off and lay to, he kept back four of his party, and helped with a will.

All at once I missed Mr Tomtit, but he appeared directly after, and I knew what he had been doing —letting loose his birds; and there were the poor little things fluttering about, and uttering strange cries, as they circled round and round the flames, some only to scorch themselves, and fall in; but, as he said, it was better to set them free, than leave them there in their cages to be burned.

At last the boat seemed to contain all that could be put in, and Van's four men were waiting, when the fat passenger, who was all in a tremble, stepped forward to get down, but Van shoved him back, saying: 'Ladies first;' and crossing to where Miss Bell was kneeling beside her brother, he caught her roughly round the waist, lifted her, and made towards the side, when she shrieked out to me to save her.

'Best go in the boat, miss,' I had half said, when, like as I supposed she did, I seemed to see through Van's designs, and stepping forward, there was a short scuffle, and I had the panting bird tight in my arms; while before any one could take a step to stay him, Van slipped over the side into the boat, and stood up in her, shaking his fist at us, and laughing like a demon as he was, as he told us to 'burn and be d——d.'

It was hard to realise it at first; but there were both boats rowing slowly away, plainly to be seen in the golden light shed by the flames, and we eight souls, one a fair delicate woman, left to burn upon that roaring furnace of a ship.

CHAPTER XVIII.

I don't care who the man may be, but it is a hard struggle for any one to see two roads open to him, the first leading to life, and the second to a horrible death, and for him to force himself to take the last one. I 'm not going to blame Sam, nor I ain't a-going to blame Bill Smith. It was only natur's first law, when Sam says to me just one word, and give his head a nod seaward. 'Hot,' says he; and he took a header off the ship's side, and strikes out towards the last boat. Then, 'Come along, matey,' says Bill; and he takes his header, and swims arter the boat—and that was two gone. As for Mr Tomtit, he was so taken up with his poor birds, that he didn't seem to care a bit about hisself, till I goes up to him, and says: 'Hadn't you better try and make the last boat, sir?'

'Make the boat, my man,' he says, in a puzzled sort of way. 'No; I don't think I could make a boat.'

'Swim arter it, then,' I says.

'No,' he says mournfully; 'I can't swim a stroke.'

'More shame for you,' I says. And then I felt so savage, that I goes up to the fat passenger as was sitting on the deck of course, and I says, says I, giving him a sharp kick: 'Get up,' I says, 'will you; you 're always a-crying.'

'Oh, Mr Roberts,' he says, blubbering like a calf —'oh, Mr Roberts, to come to this!'

'Go overboard, then,' I says savagely, 'for now you 've pumped all that hot water out of your hold, you can't sink.'

Now all this time, the fire was roaring away, and sending a glow in all directions for far enough round, while the sparks kept on dropping like a shower. It was a beautiful sight in spite of the horror; and I couldn't help looking at it a minute, till I turned round and saw Mr Ward standing quite still, looking down upon Miss Bell, who was on her knees by her brother's side. But as I was looking, she got up pale and quiet, and looked first at me and then at Mr Ward, and then she says quickly: 'Why do you both waste time? Why do you not swim after the boat?'

'And you?' said Mr Ward, in a slow husky way.

She did not answer, only turned for a moment towards where her brother lay with his head on a cushion, and pointed to him with a sad smile, and then holding out her hand to me as she sank upon her knees again by her brother's side, she said: 'God bless you, Mr Roberts—good-bye.'

I took her pretty little white hand, and kissed it, and then stood back, for she held out her hand

Digitized by Google

to Mr Ward, and he took it and kissed it, and then sank on his knees by her side, holding her hand tightly; and when she said once more: 'Go!' he only smiled and kissed her hand again.

It was so still, in spite of the fluttering roar of the flames, that I could hear every word he said, as he almost whispered to her: 'Eady, darling, I 'll never leave you.'

The next moment, her face was down in her other hand, and I could see that she was sobbing, when, feeling all wet-eyed myself, I turned away, when if there wasn't that fat passenger blubbering away more than ever!

'Get up, will you,' I says; 'I never did see such a thundering swab in my life as you are;' but all he says was: 'Oh, Mr Roberts!'

All at once I heard Miss Bell give a great cry; and turning round, I saw that Mr Bell had started up, and she was clinging to him; then he held out his hand to Mr Ward; but before he could take it, the poor fellow fell back. He was free of his trouble.

Now you know I wouldn't have cared if that there fat passenger would only have kept out of my way; but there, the more trouble one was in, and the more he was wanted out of the way, the more he piped his eye, and got just where you didn't want him. He always was a nuisance from the day he first came on board, and to make it more aggravating, he would look just as if he was made on purpose to kick.

'Why won't you get out of the way?' I says, for all this time I'd been turning over in my own mind a way to get out of the burning, if we could, and there was that great fat chap a-sitting on a hencoop that I wanted.

'Oh, Mr Roberts!' he whines again. And he cries: 'Oh, look there!'

And I did look, when, if there wasn't my two poor mates just coming up to the last boat—we could see it plainly; and if one brute didn't fire at 'em, and another stand up with the boat-hook in his hand, ready to shove the first one under.

'God help 'em,' I says, 'for I can't;' and then, Mr Ward helping me, we got a couple of loose spars overboard, and some rope to lash with, and a couple of hencoops; and as fast as Mr Ward and Tomtit, and the fat passenger, who seemed to have been warmed into life by the fire—as fast as they lowered the stuff down, I, who was over the side, lashed it together, to make something like a raft.

I couldn't do much; there wasn't time, for the fire gained upon us; and now there was no one at the helm, the ship had swung round so that the smoke and flame all came our way. I felt, too, that it was only to make life last another day or two, for there was no getting at any prog, as there wasn't a scrap of anything in the forksle; for I went down to see when I first thought of the raft. However, I shouted to them to lower down the water-breaker by the fore-mast, and they did, and then Mr Tomtit came over the side, and the fat passenger rolled down somehow, and shook my head, for the raft went low on his side. And now there was only Mr Ward and Miss Bell to come, and partly by coaxing, partly by dragging, he had got the poor girl to the side, when she turned her head to take another look, as I thought, of the poor fellow lying dead there; and as Mr Ward stood there holding her, the pair shewing out well in the bright light of the burning ship, I could not help thinking what a noble-looking pair they made, and then I shouts: 'Lower away, sir;' when, as if startled by my words, Miss Bell darted away from Mr Ward, when in a moment there came a roar as of thunder, the raft heaved and cracked under us, and beat against the side of the ship, while something seemed to strike me down, so that I lay half-stunned upon the grinding coops and spars.

But I contrived to get on my knees, struggling from under some heavy weight, and then every moment getting clearer, I understood that the ship had blown up, and that Mr Ward must have been dashed from the gangway, and fallen on to me.

And Miss Bell?

I dursn't ask myself the question again, but shoved the raft away, and began to paddle with a piece of board, so as not to be drawn down when the vessel sank. In place of being all bright light, it was now pitch darkness, except just here and there, where pieces of burning wood floated on the water, and then hissed and went out. From being so near, I suppose it was, we escaped anything falling upon us; and feeling pretty safe at last from being drawn down, I was trying to make out the lines of the ship by the smouldering hull beginning again to shew a flame here and there, when a husky voice close by shouts out: 'Help! help!'

'Here,' I cries, hailing; and the next moment we were lower still in the water, with Bill Smith aboard, and he says, says he: 'Tom, I was about done.'

'It 's only put off another hour or two, Billee,' I says. 'And where 's old Squintums?'

'On your weather-bow,' says a gruff voice, and then we went down another two inches with Sam aboard.

Well, there was some comfort in doing one's best to the last; and I began to feel Mr Ward about a bit; but he was coming to fast, and the first thing he wanted to do was to paddle back to the ship; and, thinking that we might pick up some pieces to lash to our raft, I gave way, dangerous as it was, though a very small sight worse than our present position; and we soon paddled up to the smoking mass, that I expected would settle down every moment, and then, getting hold of the side rope, Mr Ward and I got on deck.

It was not dark, for there was a little flame here and there, and in some places there was the glow of a lot of sparks, but we hadn't come to look for that; and, as we stood there forward amongst the smoke, I felt my heart heave, as, with a groan that seemed to tear out of his chest, Mr Ward threw himself down by the figure he was looking for.

She seemed to have run back to throw herself upon her brother's body, and there she was, with her arms round him, and though pieces of burning wood lay all about her, she did not seem to have been touched.

It was a sad sight, and in spite of all our troubles, I had a little corner left for the young fellow, who had clasped her in his arms, when he started up with a cry of joy.

'Here—water, Roberts, quick!' he cried; and almost as he spoke, Miss Bell gave a great sigh, and we gently lowered her on to the raft, when, getting hold of a bit of burning bulwark floating near, I squenched it out, and continued to lash it to us, so as to ease one side. Then we paddled slowly away, and lay by waiting for the morning.

to get together more fragments, and make a better raft.

CHAPTER XIX.

Morning came bright as ever, and I gave a bit of a laugh as I saw Mr Ward and Miss Bell sitting tight hold of hands; for, in place of seeming to fear him, she was now looking up to him as if for protection. Sam and Bill, poor chaps, were in a queer state, for when they had reached the boat, Van had struck at them with the boat-hook, till they had turned and swum back; and now they lay on the raft with their poor heads seeming to ask Mr Ward to come and help them; and, with Miss Bell to assist him, he did all he could for them.

The boats were nowhere in sight; but just about a quarter of a mile from us lay the ship, smoking and burning just a little, her poop and midships a deal shattered, main and mizzen gone, and lying alongside, but fore-mast standing with nearly all the rigging. As to the fore-part, it did not seem much damaged; and, as she hadn't sunk so far, it struck me as she wouldn't sink at all while it kept calm; so, Mr Ward being of my opinion, we paddled our raft back once more. We two got aboard with Mr Tomtit; and what with one of the pumps left rigged and a bucket or two, we found we got out pretty well every spark and bit of flame we could find; made our examination amongst the black steaming ruin, and found that the powder on board, or whatever it was, must have taken an upward direction, and blown a good half of the deck off. Still, so far as we could see, there was no fear of her sinking; so, clearing a spot forward, we began to think of getting the others aboard.

But, first of all, we got a bit of sailcloth, and laid it over the poor gentleman as lay there stiff and stark, so as not to distress his sister.

Now the fat passenger had offered to help us, and no doubt would have done his best; but hang me if he could any more mount the side of the *Seamew* than fly. He panted and puffed for a bit, but that was all, and then he sat down again on the raft, puffing and talking to Miss Bell when he could get her to speak, which wasn't often. As for Bill and Sam, poor chaps, they couldn't hold a head up; and I was very glad when we'd got a bit of an awning rigged up, and Miss Bell on board and underneath it.

Next thing to be done was to find some biscuit and water, Mr Ward said, for they'd finished what was in the breaker, the two poor chaps being that thirsty they kept asking for it, and Miss Bell not having the heart to refuse. So Mr Ward said water; but, speaking for myself, I said rum. After a long hunt, we found, just where we should never have thought to see it, a tin of preserved meat, and had a hard fight to open it, but we managed that; and then I was in luck soon after, and turned up a bag of biscuits, half burned and smoked, half sound; while a little hard work laid bare a water-cask, and I filled the breaker.

It was quite warm, that water was, but in our state every drop was so much bottled pleasure, and after a good hearty draught, I was ready for any amount more work.

So, after forgetting them for some time, I goes up the fore-mast, and had a good look out for the two boats; but not a sight of them could I see, after a good half-hour's watch; when I came down, and helped Mr Ward and Mr Tomtit to get all the burned wood overboard.

Now, done up as we were, it wasn't reasonable to expect a vast deal of work done; but we kept steadily on till it was dark, when we finished the tin of meat, had a biscuit and some water apiece, settled that I was to keep the first watch; and then, without a mutineer within reach, the others lay down to rest, for we had settled, Mr Ward and me, that Mr Bell should be buried at daybreak.

Well, I took my place, and helped myself to a quid, leaned over the bulwark, and watched the clear bright stars, now in the sky, now as I saw them reflected in the water, and then I got asking myself questions about how it was all to end, when I thought I should be more comfortable sitting down. So, picking out a spot, I began to reckon up how long it would be before I must call Mr Ward to relieve me; and then I thought that he'd feel as bad as I did, and want Mr Tomtit to relieve him, and then he'd watch till daybreak, when he'd relieve the birds, and Mr Ward would put a piece of fresh bandage round the turtle-dove's head, and if the fire broke out again, the fat passenger would cry upon it till Miss Bell boxed his ears, when he'd relieve me, and I should—no, I shouldn't—yes, I should——

I started, saying to myself 'I was nearly asleep,' when I took a fresh turn at my quid, and Mr Ward asked me if I'd marry him and Miss Bell, and the fat passenger could give them away, and then go and sit on the raft with me, and sink it down, and down, and down, and always going down, and lower and lower; and instead of its getting darker and darker, it got lighter and lighter, and there seemed a warm glow as from the sun, only it was the water so far down seemed to choke; and I told Mr Ward I didn't think it quite proper, but I'd marry them if the fat passenger would not give them away, but get out of the way—and—avast, then—avast, then—yes, what?—all right——

'The fire has burst out again,' cried Miss Bell.

And that just while I closed my eyes for half a minute.

CHAPTER XX.

You see there's that in a fire, that it never knows when it is beaten: you drive it down in one place, and it comes up in another, just where you least expect it; while, after such a shock as we had had, there was nothing surprising in our feeling as most people do when there's a fire in a ship with a mixed cargo—afraid of an explosion. There were the flames towering up again quite fiercely and always in the most savage way, just out of our reach.

But if the flames could be savage, I felt that I could too, for, you see, I looked upon it as my fault, for sleeping at my post, when I ought to have seen the first flash out. So I got down amongst the smoke and steam, and as they handed me buckets of water, I placed them well, and by degrees we got the fire under again. It was just about daybreak as we turned all the glow and flame into blackness, half-hidden by steam; but even then we daren't leave off, for another such outbreak would have made an end of us. Even now, most of the cargo seemed destroyed, and it was cruel work, for everything fought against us except the weather, which certainly did keep clear and calm, or we must have gone to the bottom. But, as I said, it

Digitized by Google

did seem such cruel work to have things that we were ready to die for the want of destroyed before our eyes.

We were all worn out; but sooner than run any more risks, we kept on pouring water into the hold, till it seemed quite impossible for fire to break out again; and there we were at last with the ship our own, what there was of it; but though there was a good-sized piece of the fore-deck left, and a little round the wheel, the only way to get from stem to starn was by climbing down amongst the burned rubbish, and then making your way through it till you reached the starn.

By means of a little hunting about, though, we managed to get at some provisions, and among other things a cask of pork, with the top part regularly cooked. We got at water too, and some rum; and then it didn't seem to matter, danger or no danger, fire breaking out or mutineers coming back, sleep would have its way, and one after the other we dropped off, the fat passenger in a corner, and Mr Tomtit with his legs dangling down over the burned hold.

I talked to Miss Bell and Mr Ward afterwards about my having neglected my duty, but they would hardly have a word about it, and now I found that though we had all slept, Miss Bell had been awake and watching; but now she went into the sort of tent we had rigged her up; and Mr Ward having the same thing in his head as I had, we went and had a talk together, and an hour afterwards we had poor Mr Bell neatly wrapped in a piece of sail-cloth, with some iron stanchions and bolts at the feet, and lying decently waiting for Miss Bell to wake again.

She came out of her tent at sundown, looking pale and haggard; and as soon as she saw what we had been about, the tears began to roll down her cheeks, and she came and knelt down by her brother's head and joined her hands.

I did not want the sign Mr Ward made me to do as him and Mr Tomtit did, and there we knelt for some time on that calm, solemn sort of evening, with the ship just gently rolling on what seemed a sea of orange. There wasn't a breath of wind stirring, but all was quiet and peaceful, with only Miss Bell's sobs and the twittering of birds to break the stillness.

I don't think I said so before, but there were a many of the birds escaped the fire, and perched about on the deck and the rigging of the fore-mast; and when Mr Ward and I had gently lifted the body of the poor gentleman on to a hatch by a port, we drew back, and knelt down again, thinking Miss Bell might like to say a prayer aloud before we gave the body a sailor's funeral, when one of Mr Butterwell's robin-redbreasts hopped down upon the deck, and then giving a flit, perched right upon the dead man's breast, and burst out into its little sad mournful song, making even my poor old battered heart swell and swell, till I was 'most as bad as the fat passenger, whose complaint I must have caught. I can't tell you how much there seemed in that little bird's sad song, but it was as if it took you back into the far past, and then again into the future; and weak as the little thing was, it had a strange power over all of us there present.

As if that robin had started them, the sparrows began to twitter just as though at home in the eaves; a thrush far up on the foreto'-gallant-yard piped out a few notes; and a lark flew up and out over the glorious sea, and fluttered and rose a little way, singing as it went, just as if it were joining with the others in a sort of evening hymn. And now it was that Mr Ward made a sign to me, just as he 'd told me he would; and I got up and went softly to raise the head of the hatch, to let the burden it had on it slowly slip into the golden water. But with a faint cry, Miss Bell started forward, seeing what I meant, and half throwing herself upon the long uncouth canvas wrapping, she sobbed and cried fit to break her heart.

It was a sad sight, and there was not a man there who did not feel for the poor girl. I felt it so much myself that I was glad to turn away; and there we all waited till the sun dipped down below the waves, lower and lower, till he was gone, and a deep rich purple darkness began to steal over the sea. From golden orange the sky too turned from red to a deep blue, with almost every colour of the rainbow staying where the sun had gone down. Then it grew darker and darker, with star after star peeping down at us, and the smooth sea was here and there rippled by a soft breeze that came sighing over us.

And now it was that Miss Bell's sobs seemed to have stopped, and leaning over her, I saw that she had gently slipped away, so that only her poor white arm lay across the body, and when Mr Ward gently lifted it, her head sank lower and lower, and we knew that her grief had been too strong for her, and she had swooned away.

I've been at more than one sailor's funeral, which has a certain sadness about it that seems greater than what you know ashore, but this seemed to me the worst I had ever had to do with. Trouble seemed to have been heaped upon trouble, and though in the heat and excitement of a storm or a fight you often go very near death, yet you don't seem to fear it as you do at a time like this was, when as I stood over that bit of canvas it seemed to me that I was nearer to my end than I had ever felt in all the dangers I had been through.

It was growing darker and darker; the birds had all stopped their twittering, and I was thinking and thinking, when in a slow sad way Mr Tomtit got up, and came and stood over the corpse, and tried to speak, but his voice seemed choked. He went on after a minute or two, though, and said, in a quiet deep voice, a short and earnest prayer, one that I had never seen in a book, nor heard before or since; and in it he prayed the great God of all people, who had seen the sufferings of this our poor brother, to take him to Himself, even as we committed his poor decaying body to the great deep—the Almighty's great ocean, upon which we poor helpless ones now floated—thanking Him for His preservation of us so far, and praying that His protection might be with us evermore. And he prayed too that as it had pleased God to bereave the sorrowing sister, might it please Him to put it into the heart of every man present to be a new brother and protector to the weeping one, even were it necessary, unto death.

And then there was a great silence fell upon us all; then came a slow grating sound, a soft rustle as I raised the hatch, and a heavy splash in the water, which broke up into little waves and flashes of light, to die away again into darkness.

There was more than one deep sob heard there that night from out of the darkness; and though dark, it was not so black but we could see Miss

Digitized by Google

Bell at Mr Tomtit's feet, holding his hand as he bent over her, and she seeming to be kissing and crying over it.

No one seemed to care to move for a long, long time, but at last Miss Bell's dress rustled softly as she glided away to her tent, and then Mr Tomtit went and leaned over the side. And mind, I do not call him by that name from any disrespect, for though we had all been ready to laugh at him for his looks and ways, there was not a man there but would have gone and gladly shaken the hand which Miss Bell had kissed; and I felt vexed myself for not feeling before how good a heart the man must have who had so great a love for all of God's creatures that he would risk his life even for his birds.

That was a sad, sad night, though the ship seemed lighter now that there was no longer death on board; and I was in such a low miserable state, that I did what seemed to me to be the only thing I could do that night, I went and sat down beside the fat passenger.

CHAPTER XXI.

We had no time for sadness and sorrow; there was too much to be done. I would not fly a signal at the mast-head, for fear of its bringing the mutineers back, for, though it did not seem likely that it would, I did not wish to run any risk. But with the help of Mr Ward and the others, I set to, and we made a good strong raft, and provisioned it, in case of a change of weather, for, though keeping us up well now, I felt sure that a fresh wind must send the ship to the bottom. All I thought would be of use to us I got on the raft; and I spent a many days lashing on a cask here and a spar there, and even rigged up a little mast with a lug-sail, and had an oar or two for steering. I couldn't get myself away from that raft, feeling to want to make it perfect, which it wasn't at all. But there it was, and the best I could make; and day after day we rolled about in the long gentle swell of the great ocean, looking for something to heave in sight.

There was very little to occupy us beyond looking out, for sailing the ship was out of the question, since, if she had careened over, the water would have come pouring in at one of the rents in her side; so we waited on day after day, during which time it seemed to me that a sort of jealous feeling was springing up between Mr Ward and Mr Tomtit, for Miss Bell used to keep away all she could from the young doctor, and sit and talk hour after hour with Mr Tomtit about his birds. But Mr Tomtit, though he used to look pleased, only looked so in a quiet, sad sort of way, and I used to think that he felt it did not mean anything for him; and he'd go and feed his birds afterwards, and sigh as he did it, and always try to be good friends, as far as he could, with Mr Ward.

It was a fine thing for us that we had a doctor on board, for I believe he saved both Bill Smith's and Sam's lives, poor chaps, for they had been sadly mauled about by the mutineers, and for days and days all they could do was to lie still and talk wildly about things. Sam in particular would rouse us all of a night by shouting out that Van was striking him; but they both got better by degrees.

Last of all, what I was afraid of happened—the wind changed, and it came on to blow a little. It was nothing more than a pleasant fresh breeze, but enough to make the sea dance a bit, and the old *Sea-mew* to roll and pitch, so that I was obliged to have a man at the wheel, and a bit of sail set, to keep her out of the trough; but handle her how I would, I couldn't keep the water out, and the question got to be, how long could we wait without taking to the raft? and another question was, too, how long could we keep to the raft without being washed off? Thinking of this made me rig lines round it, and give an extra lashing here and there just where I could.

The next day, there was not a doubt about what our duty was; and getting the raft round to the lee quarter, we lowered Miss Bell down, and then made ready to join her; when, more from use than anything, I ran up the rigging to take a sweep round, when—I could hardly believe my eyes—there was a brig bearing down under easy canvas, and not three miles off! We were so busy, or we must have seen her before. Howsoever, my first act now was to hoist a signal; and then, there being no time to lose, I got aboard the raft, being last man to leave the vessel; and then we hoisted a bit of sail, and made towards the brig.

We had not left the *Mew* a minute too soon, for, just as we had got about two hundred yards away, a squall took her, and she bent right over, righted, careened again, and then settled rapidly down, and was gone.

We were all so taken up with the sight, that, for a moment, we forgot the brig, and when we turned to her again, she was bearing away. I thought that she had seen our ship, when we hoisted the signal; but from her acts, this could not have been the case, and now every second she was increasing her distance. We shouted, we yelled, and hoisted a handkercher on the end of a boat-hook; but she did not see us; and gradually we saw sail after sail dip down out of sight, and we were once more all alone on the great ocean.

If we had seen no ship, I should not have cared; but this seemed such tantalising, despairing work, and but for Miss Bell, I should have been about ready to give up.

That night I was sitting steering our lubberly craft, when Miss Bell came and sat beside me, and after being silent for some time, she points out seaward, and asks me if what she saw was a star.

I looked at it for a few minutes, for I hardly dared to answer at first, but I felt sure directly after, as I told her it was, and a bright one for us, being a ship's lantern.

CHAPTER XXII.

Soon after sunrise next morning, we were laughing, crying, and acting as bad as that there fat passenger, for we were aboard a large ship, whose light had shone out like a star of hope for us; and when they picked us up, I found that the vessel was bound for Sydney.

But our pleasure did not last long, for what with the exposure and excitement, Miss Bell broke down, and next day she was so far from being in safety that she was in a raging fever.

Perhaps I may be right, perhaps wrong; but measuring things as I saw them, it has always struck me that, true-hearted man as he was, Mr Ward would never have won his wife after all, if it had not been for that fever; but it must have

Digitized by Google

been a fine thing for him, being the only doctor within reach, to have to tend on her, and most likely save her life.

It was in after-years that I saw them happily settled in Wellington; and as they had me seated there between them, they seemed to treat me quite as an old friend as we went over together the old days, and Mr Ward told me laughingly how hard a fight he had had to win his wife.

We talked long over our old troubles; and I had news for them of some of the mutineers—of how I had learned that one boat had been picked up, with the crew's story written on their faces, for they had suffered horribly before they were saved from certain death. As for the other boat, it was never heard of more.

I had news for them too of Mr Tomtit, whom I had seen in the street just before I left England on that cruise. He had shook me heartily by the hand, just as if I was his equal, and taken me home to shew me the collection of birds he was about to ship, with a lot of what he called baby-salmon, for Sydney. He was still a bachelor, and pressed me hard to go and see him again, and wanted me to stay dinner then; but my time was short, and I had to say good-bye, though not till I had asked if he had seen any more of the fat passenger. Mr Tomtit then told me that he had been to England, and called to see him, and shed tears when he said good-bye. I said it myself now; but he made me stop for a glass of grog, and a half-hour's chat about our perils aboard the *Sea-mew*.

THE MONTH:

SCIENCE AND ARTS.

When the scientific soirées begin, it is a sign that the scientific season is half gone; and now the Easter holidays are over, and scientific investigators are working the harder to complete their self-imposed tasks before summer comes with alluring smile to entice them to the seaside or the mountains. General Sabine, the President of the Royal Society, has held two soirées, in which, as usual, science and art were exemplified in a very interesting way, and ingenious mechanical models were exhibited. Among them, was Mr Bidder's coal-winning machine, of which we have recently made mention; and Mr Price Williams' switch, which entirely does away with the numerous 'points' seen at railway junctions, and keeps the main line of rails always unbroken, whereby a frequent occasion of danger is avoided; and Mr Milroy's excavator, which digs equally well on land or under water, and is very useful in digging out the foundations of bridges, or in sinking cylinders. It may be described as a heavy metal ring suspended by chain and pulley, and carrying a number of hanging flaps. These flaps, when the ring is lowered into place, and agitated, act as spades; and when a sufficient quantity of earth or sand is loosened, they can be so regulated by another chain, that they bring it up to the surface, where it is dropped into a truck and carried away. From these particulars, it will be understood that deep holes can be dug, even under water, without sending men down to do the work.

Well deserving of notice is a much improved safety-lamp for use in mines, invented by Mr Story Horn of Newcastle-on-Tyne. It has long been known that the Davy lamp does not insure safety under all circumstances: it is liable to become choked, the light is dim, and in some conditions it may occasion an explosion. These defects are remedied in Mr Horn's lamp: the light is good; accumulation of soot cannot take place to render it dim; and whenever explosive gas finds its way in, the construction of the lamp is such that it becomes its own extinguisher, puts out the flame, and thereby prevents an explosion. There are other points in its favour; but these we may omit, as in the foregoing brief sketch the merits of this new lamp are sufficiently set forth, and because it has been tested in the severest manner, and proved trustworthy.

Mr F. N. Gisborne, who has for years past made himself conspicuous by his signals for use on board ship, in mines, factories, or dwelling-houses, has now brought out a method which, for simplicity and efficiency, excels all his previous inventions. First, he used galvano-electricity, then pneumatic tubes, and compressible air-chambers, both costly and liable to derangement. Now, with a balance-weight and a chain, he accomplishes all he desires with his system of signals. A captain standing on the bridge of a steamer can, by touching the indicator, send an order to the steersman or the engineer, and see at once whether they obey without changing his position. And that which can be done in a ship can be done in a house, workshop, or mine, and by a simple mechanical arrangement, which can hardly fail to be received with favour. It has been already adopted in the five leading navies of Europe; and the great Prussian iron-clad *König Wilhelm*, now building on the Thames, is fitted with a set of Gisborne's signals, finished in a style which may be truly described as royal.

A magneto-exploder, constructed by Breguet of Paris, was shewn, which will fire a fuse, and consequently a cannon, at any distance from two feet up to two hundred miles.—And Mr Clerk Maxwell exhibited a 'Wheel of Life,' containing what he calls dynamical diagrams, and these, when the wheel is set agoing, produce many remarkable phenomena of curves and their intersections. Thus, in the hands of a philosopher a toy becomes a means of illustrating the laws of curvilinear motion. Teachers of geometry and natural philosophy would find it useful.—And Mr N. J. Holmes, who is among the foremost of our telegraphists, exhibited his new magneto-alphabetical telegraph, which is one of the cheapest, if not the cheapest and simplest yet constructed. It comprises two circles of buttons, and the operator has only to touch button after button, and spell out his message as rapidly as he pleases. With this and other instruments before them, government will have a sufficient variety to choose from when they assume control of the telegraphs.

Messrs Silver & Co. exhibited specimens of their Norwegian Cooking Apparatus, adapted to different purposes and circumstances, and of different dimensions. One was provided with a thermometer to shew the slowness of the rate at which the heat is lost. In one of the small boxes, a pint of water locked up boiling hot at eight o'clock in the morning, was still warm at six in the evening. And in like manner, the apparatus can be used as a refrigerator, and for preserving ice a considerable time unmelted.

Mr Graham, Master of the Mint, by a singularly

Digitized by Google

ingenious experiment, shewed the prodigious amount to which the metal palladium will absorb hydrogen: an amount exceeding by some hundreds of times its own bulk. Two ribbons of palladium, attached to the two poles of a battery, were seen loosely coiled in a water-bath. The current was turned on: the ribbons took in so much hydrogen that they expanded, uncoiled, and stretched themselves across the bath, as if alive. The current was reversed, the hydrogen was thrown off, and the ribbons resumed their coil. They might have been compared to a couple of writhing worms. The sight was amusing; but it exemplified the researches by which Mr Graham has thrown light on an important question in cosmical science, and led him to the discovery of the new metal, to which he has given the name of hydrogenium.

The Meteorological Office of the Board of Trade (we wish they would call it the Weather Office) exhibited diagrams, some shewing the recurrence of similar gales in January and December 1868; some, the weather returns from the seven British and Irish observatories during the gale of August 22d last, giving the direction and force of the wind, and the isobaric (equal-pressure) curves. Others represented the wind, weather, barometer and thermometer readings, as observed on board the royal mail-steamer *Sidon*, on her voyage from Liverpool to New York and back; and in this we have an important instalment of the ocean statistics which it is the business of the Board of Trade to collect.

From all this, it may be seen that a scientific conversazione represents a wide range of the progress of science; while, as we proceed to shew, it at the same time exemplifies the arts. There was a specimen of the first beet-root sugar manufactured commercially in this country; and specimens of the juice as expressed from the roots, and after defecation, and of the waste pulp which finds a ready sale as cattle-food.—There were two or three simple forms of filter which might be carried in the pocket.—There was a model of the viaduct now building across the Holborn Valley—A piece of inscribed bullock's hide, shewing three capital letters and a rude hieroglyph, brought from the south-east coast of Africa, and supposed to be a message from survivors of shipwrecked crews, now prisoners in the interior of Somali Land.—There were photographs of Mount Sinai and of the surrounding country, taken by the party now engaged in surveying that remarkable land, and very wild and striking prospects do they represent. By and by, a model in relief, made at the Ordnance Survey Office, Southampton, will be brought out, and then scholars will be able to study and follow the route of the Israelites.—Not less remarkable are a series of photographs of Abyssinia, taken during the march to Magdala by the Royal Engineers. The country therein represented must surely be the most rugged and precipitous in the world. Hannibal's march across the Alps must have been a holiday trip in comparison.—Of quite another aspect were the views in the Antarctic regions, which are now becoming important, because from some part of those regions will the two next transits of Venus have to be observed, and astronomers and others are beginning to inquire as to the best place in those desolate latitudes to establish a temporary observatory, and the preparations to be made for the voyage. It is impossible not to wish success to their endeavours, for the settlement of some of the most important questions in astronomical science depends on good observations of the transits.

It is recorded of some of the early Venetian painters that they laid on their colours with palette knives of different widths, and never used the brush. Mr White Warren has revived the process, and exhibits a number of pictures in oil, all painted with the knife, and with marked effect. Land and water pieces, houses, ruins, Gothic towers, and flower-beds present a sufficient variety to test the capabilities of the art and the artist. At present, he appears to be most successful in clouds, landscapes, and gardens.

THE SANCTUARY.

Not in the proud cathedral,
Where splendid thousands throng;
Not in the faint and formal plaint,
The loud thanksgiving song;
Not in the studied homily,
The doctrine vague and dim,
There comes that softening grace to me
That lifts my heart to Him.

I kneel in supplication,
But the truant thoughts will stray;
The lips repeat the words, as is meet,
But the heart is far away.
There comes no holy, blessed gush,
No tender yearning there,
Till the head bends low, and the warm tears rush,
And the spirit melts in prayer.

But alone, alone with nature—
On the everlasting hill,
That proudly arose at the world's birth-throes,
And stands unaltered still.
Down shady lanes where the wild-flowers grow,
In forest depths untrod,
In still small accents, faint and low,
I hear the voice of God.

On Saturday next will appear the first portion of a New Novel, entitled

A COUNTY FAMILY.

By the Author of *A Perfect Treasure*.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1*st*. All communications should be addressed to the 'Editor, 47 Paternoster Row, London.'

2*d*. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3*d*. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4*th*. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

A COUNTY FAMILY.

BY THE AUTHOR OF 'A PERFECT TREASURE.'

CHAPTER I.—SLOGAN.

On the northern coast of North Wales stands Slogan, with its foot in the sea. It is a great mountain; great in size, though that is its least remarkable attribute; great in wealth, for it is a treasure-house of useful stone; and great in dim historic memories. On its summit was once the camp of a British host, year after year; but the Roman eagles never flew so high. Around it still survive, like circlets about a monarch's crown, three mighty rings of *débris*, that were, a thousand years ago, three ramparts of stone. Within them are still visible the casemates in which the defenders lived, and watched as from an eyry, land and sea. Many a vale, now fertile, can be seen from it, stretched out like an open map, and the rugged outlines of a hundred hills. On the calmest day in June, there is wind enough on Slogan's top to belly out the folds of a royal standard, which mayhap (in some shape or another) in days of old it did.

But few folks care to climb to the summit now, or to concern themselves therewith. As with the maiden in the ballad, it is the face of Slogan which is his fortune. Not, however, as in her case, by reason of its beauty. It is scarred and seamed, as surely no other mountain ever was, by the hand of man. Not Xerxes, with all his power, could, in his insolent domination over nature, have so transformed a hill, as the patient hewers of stone have altered Slogan.

Naturally grim and stern enough, he has now, thanks to pick and gunpowder, become one scar. Like an ancient warrior, whose ferocity has been enhanced by the small-pox, he scowls upon the *smiling* summer sea. Fifty times a day he emits, volcano-wise, a little puff of smoke, and then the stones come rattling down, and there is yet another blemish in his majestic features. Some of him, in point of fact, is *gone*. A day will come (forty generations hence, however) when Slogan will indeed be literally, as well as metaphorically, a thing of the past. The last wagon-load of him will then have gone to pave the streets of what may be Liverpool and Manchester in one.

But at present he is high and huge enough, and though girdled about by tramways, and divided into stages by inclines (which should be rather called 'perpendiculars'), these are scarcely to be seen from the foot of him at all. You must toil up some winding path, worn in the slag and refuse, to discover them. Then you will also find that Slogan is a very ant-hill of human beings. About his forehead, men are clustering like ants indeed; appearing and disappearing, some with burdens, and some without, but all in motion. The mountain resounds with the stroke of their picks; with the echoes of the bugles, which give warning that a blast is about to take place; and with the roar of the blasts themselves. From terrace to terrace the stone is carried in huge trucks, that descend with immense velocity, and are connected by an endless chain, which by their weight at the same time hauls up 'the empties.' By the side of these inclines are ladders of stone, by which the quarrymen go up and down. These workers, whose calling lies in so weird a spot, two thousand feet and more above the fields in which their forefathers laboured (for this trade is comparatively new), are, in their appearance, different from other men. They are giants—often in height, but always in thews and sinews. The breeze of the mountain or of the sea blows perpetually upon them, and they thrive in it amazingly. The hammers which they use with ease, a field-labourer could scarcely lift. They are as good-natured as were the Goths, but, like them, are subject to fits of passion, and then——

Digitized by Google

They are affable, but it is no use addressing them in the English tongue, because they do not speak it. They understand, however, the one word 'beer,' especially when accompanied by the exhibition of a silver coin. For the rest, the magistrates assure you that they are an extremely well-conducted race of people, and the Established clergy have nothing to say against them, or to do with them at all.

Upon this August morning there are six hundred of these Titans upon Slogan, armed with spade and pick; but it is now noon—the truce-time between them and Nature, when they lay aside their weapons, to dine. Upon the most elevated terrace, and approached from the rest only by these steep inclines, there are a hundred men or so, consuming their mid-day meal—generally a hunch of bread and meat that would last you and me for a week. Some of them sitting in the open, under the shadow of the cliff; some in the little bomb-proof huts, which are built very literally as 'shelters from the blast;' and a few even swinging against the face of the rock from the ropes that support them there during their labours. Dangling between sea and sky, in a manner that makes one dizzy to behold, they lazily cut and munch, and watch the white-sailed ships come out and in, that carry away the result of their labours from the little jetty; but otherwise they are not greatly interested in the spectacle that nature spreads before them, and which causes such exhibitions of enthusiasm in those summer visitors from the neighbouring village who have the hardihood to reach the spot. There is one such visitor even now; a tall young fellow of what is called 'distinguished' appearance, and certainly of an appearance very distinguished from the rest of the occupants of the plateau. His face is pale, and rendered still more so by the black moustache he wears, curved like a bow, and twisted at the ends; his small hands are as white as a woman's, and though his limbs are well and strongly shaped enough, he seems, by comparison with those sons of Anak about him, almost like a woman in man's clothes; he appears effeminate even by contrast with the young overlooker by whose side he stands, and who is explaining to him the details of the scene before him. And yet John Denton is no Hercules. He is only a fine strong-built young fellow, with an eye like a hawk, and a broad brow, over which the short brown curls cluster so thickly that it seems low: his fingers, it is true, are long enough to have pertained to one of much greater height, and are extraordinarily supple; his speech is precise and distinct, whether he gives directions to the quarrymen in their own tongue, or addresses his companion in English. It was in this, rather than in build, that the most marked difference between himself and Herbert Stanhope lay. The latter spoke with effort—used that languid mode affected more or less by all young men of his class, and which, to some ears (notwithstanding that the speaker may mean to be civil and well behaved enough), sounds always galling and contemptuous. And thus it was in the present case, where certainly no assumption of superiority was intended.

Herbert Stanhope was no drawling swell from the Row or St James's Street, but he had passed much of his life among those silly fops, and had contracted their manner. If he had been born a poor man, and Denton a rich one, their present positions might quite possibly have been reversed: as it was, the former was running through his fortune as quickly as racehorses (and other luxuries pertaining to 'fast' life) could help him to do it; while John Denton was making his way *up* the social ladder with as sure a foot as he scaled the inclines of Slogan. A parish orphan, he had risen at the National School to be pupil-teacher; then exhibiting considerable talent for figures, he had been employed by the agent for the quarries, first at his office, and subsequently on the mountain, and was now biding his time—preparing himself, meanwhile, by incessant study in leisure hours—for quite another line in life, that of civil engineer, an appointment connected with which profession had been promised to him by his present employer. It was the old story of a self-made and self-making man, but with a difference. John Denton's nature was not of that grasping sort which uses all things only to one end. He was ambitious, but not so greedy of success as to deny himself all refreshments upon the road to it, so that when it is reached at last, the appetite for them, so unnaturally thwarted, has fled for ever. One may wait for the enjoyments of life as one may wait for one's dinner—too long; and perhaps John Denton might have done so, his mind being deeply set upon getting on in the world, had it not been for one circumstance: he was not working for himself alone. His eyes were so bright, and his face so smiling—although, as we have hinted, it would now and again flush angrily at his companion's tone—because there was a certain modest damsel, on the other side of Slogan, who had promised to be his bride, in good time; by which we mean early; for he was still in that station of life in which it is found possible to marry on even less than three hundred pounds a year.

'Who is yonder old man with the big white head, Mr Overlooker? He seems too ancient for this sort of hammer-work, although I noticed that you (very properly) were not disposed to be hard upon him'——

'I do not understand you, sir,' interrupted Denton, with irritation. 'Mr Blackburn is no idler, I can tell you; although his arms may not move so fast as a younger man's.'

'*Mr* Blackburn, eh? What! have we gentlemen quarrymen here, then? Well, upon my life, now you mention it, there is an air of past grandeur about that old fellow, as though he had seen better days.'

These remarks referred to one, who, while certainly by far the senior of those present, wore also a look of superiority almost as great as that of Mr Stanhope himself, although it owed nothing (as in his case) to attire, which was that of a common labourer. This personage was sitting with his back to the rock, his arms folded, his lips compressed, and his eyes darting from underneath their shaggy brows no very agreeable glances upon Stanhope himself.

'Hush, sir!' muttered the overlooker sternly; 'do you not see that he observes you are speaking of him with pity; and that he does not wish to be pitied?'

'I will give him half-a-crown, and a better cigar than he ever smoked in dreams, to make my peace with him,' returned the young gentleman with a sort of good-natured scorn, as he drew from his pocket a sealskin case.

Digitized by Google

'If you offer him money,' interposed Denton hastily, 'he will break your head in with his pick, sir. Anthony Blackburn is as much a gentleman as you are, every whit, although he is a poorer man than even I.'

'What!' ejaculated the other, in a voice that, in his great surprise, had lost every trace of languor, 'do you mean to tell me that that is Anthony Blackburn of Derbyshire—the man who was disinherited fifty years ago for marrying his mother's waiting-maid? Why, I've heard my grandfather tell that story a dozen times. My own house is within half-a-dozen miles of Redcombe Manor: I know the place as well as you know this quarry.'

'If you know anything about such matters, sir, for Heaven's sake, do not speak of them so loud. The remembrance of all that has past and gone is bitter to him as gall, and needs no revival. He was shamefully used by his own flesh and blood, as I have heard—parents, and brothers, and all.'

'Yes, it was hard lines. His father, Russell Blackburn (who was as proud as Lucifer, and as cruel), turned him out—eldest born though he was—in the cold, for marrying the girl for whom they do say the old satyr had a penchant himself; then, when he died, the three brothers followed suit. I don't suppose any one of them ever gave our friend there a farthing.'

'Ay, but they were punished for it,' answered Denton gravely. 'They were cursed in root and branch.'

'What! by the old gentleman yonder?' returned Stanhope with a cynical smile. 'Well, I daresay they were. But hard words did not break their bones, my good friend—it was hard riding that did that; at least, the second brother, Ferdinand, broke his neck in a steeple-chase; and something of the same sort happened to his son. Then hard living killed the third brother, Charles—he drank like a fish, and would not permit a woman to come within the Manor gates; but he had his good points, people said. Then Richard was drowned in the Dove. In fact, if it was not for young Dick, this old gentleman stonebreaker might yet enjoy his own again, for, as I have heard, his name was put in the entail by his father last of all, by way of mockery, since it seemed out of the question that he should survive three younger brothers and their children. However, against nineteen (for Dick is scarcely of age), sixty-eight (and old Anthony must be that at least) has not much chance; and, moreover, Dick's going to be married.'

'For Heaven's sake, don't tell him *that*, sir!' exclaimed Denton earnestly. 'It is a hopeless fancy, as you say; but, nevertheless, he clings to the idea that he shall still one day be master of Redcombe Manor. It is his dream by night, his castle in the air by day. He is always saying how that young Squire Richard has a short throat, and will die of a fit, notwithstanding Miss Ellen tells him how wicked it is thus to'——

'And who is Miss Ellen?' As though to recompense himself for the unwonted interest he had evinced in his recent talk, Mr Herbert Stanhope put this question with raised eyeglass and an elaborate indifference.

'She is Anthony Blackburn's orphan grandchild,' said John Denton quietly, after a little pause.

'And the only one?' inquired the other lazily. 'Gad, I'd take fifty to one, in ponies, about her coming into the property after all.'

'Ellen is only the grand-daughter,' observed Denton coldly. 'Anthony had another son besides her father.'

'*Had!* Is he dead, then?'

But before this question could be answered, a young girl came swiftly round the more distant corner of the crag with a covered basket in her hand, and on towards the spot where the old man was still sitting, with his eyes moodily fixed upon the ground.

'What a charming little fairy!' observed Mr Stanhope critically; 'with what a grace she carries herself as well as her basket! But it must be hard work for her coming up these steep inclines of yours, Mr Overlooker, eh?'

'She does not come up that way,' answered Denton curtly; 'there is a path over the mountain down to this top level.'

'How queer it seems to see a petticoat among all these rough fellows,' continued the other musing. 'It must be rather a dangerous experiment for her, surely?'

'What! for a modest young girl to bring her grandfather his dinner?' returned John Denton bitterly. 'It may be different—I have heard it is—among gentlemen such as you; but if any man here were to offer her an insult, the rest of them would pitch him down the mountain, as though he were a barrow of rubbish; and serve him right, too!' added the speaker with vehemence.

'To be thrown from the Tarpeian Rock for snatching a kiss from yonder pretty damsel? Well, that seems a severe punishment, considering the great temptation,' answered the other coolly. 'I had no idea the Welsh code of morals was such a strict one. The Registrar-general's Report upon the subject—— Ah!' cried the speaker, perceiving the young girl had seated herself by the old man's side, 'that is Anthony Blackburn's grand-daughter, is it? Then, now I see what you mean. There is something in good blood, after all the Radicals have said, which carries weight with it even here, it seems. You look upon this young girl as a sort of lady, eh! although she has been dispossessed of her property: well, it's very creditable to you, Mr Overlooker, and shews how the feudal spirit still survives in these outlandish latitudes.'

'You mistake, sir, altogether,' answered Denton in a voice that shook with passion. 'All blood is alike in my eyes, and all women have an equal claim to my protection, but Ellen Blackburn is my promised wife, and demands a respect from everybody which I shall take care is paid.'

'My good sir,' said Stanhope quietly, as he scanned the young girl with undisguised but not impertinent admiration, 'I do assure you I respect Miss Blackburn amazingly, and I congratulate you with all my heart.'

CHAPTER II.—OVER THE HILLS TOGETHER.

When Denton said that the quarrymen all treated Ellen Blackburn with consideration, he did not exaggerate the fact; and Stanhope also was right in concluding that the position her grandfather had once held in the world had something to do with it. They pitied the misfortunes of this old man, who had worked among them with such seeming patience for many years, and had done

nothing to offend them; while the tender grace of the young girl herself—so different from the robust attractions of their own charmers—won from them a certain courtesy, which shewed itself in their abstinence from remark upon her actions. If other young women had brought dinner to their relatives to the 'top level,' they would, doubtless, have hardly escaped comment and rough compliment; but of this sprite-like messenger no notice was taken. She had tripped along past group after group, and save from a kindly nod from a giant head or two, which she had acknowledged by a grateful smile, had excited no stir. It was a sight they saw every day—this pretty but pale-faced girl, with her covered basket, which contained bread and meat for her grandfather; and they looked upon it, through their tobacco-smoke, approvingly.

'You are late, my dear,' said the old man, lifting up his gray head as she drew near, and regarding her with eager eyes. 'Was there any reason for it—any particular reason?'

'There was the reason of the wind upon the hill, grandfather, which was dead against me,' answered the girl smiling. 'See, I have brought you your favourite dinner—beef with mustard, and a nice fresh lettuce.'

'There was nothing for me by the post, then?' inquired the old man, without taking the least notice of these dainties.

'No, grandfather.'

This reply was given with a dejected air, quite different from that with which she had hitherto spoken. The fact was the post had not yet come in to their out-of-the-way cottage, but she had answered that same question a hundred times, and always in the negative. Anthony Blackburn was for ever expecting a letter that was to tell him that the last barrier between him and his rights was removed—he cared not how, but surely, if there was justice in heaven, the thing, however long delayed, must so happen at last. Was it not clear that a judgment had gone forth against his usurping kindred? First, Ferdinand and his son; then Charles; then Richard swept away; and now there was only Richard's brat between him and his long-lost wealth. Would not death take this one, like the rest? After fifty years of waiting—years of toil and gloom indeed, but which had been illumined occasionally by these family casualties, these spectral fires, in quite a brilliant manner—the goal would be surely reached at last! True, it was a boy's life against his own; but had not Ferdinand's boy died before he had reached this lad's age; and were not his father, and Charles, and Richard, all junior to him (Anthony); and yet all were dead! However, the news was not to come to-day, it seemed; and the old man, after one weary sigh, began to eat his meal.

Anthony Blackburn was, independently of his white beard and shaggy eyebrows, of a striking appearance; straight as a poplar, notwithstanding his weight of years, and the long use of the huge hammer which lay near him; his eyes had lost none of their fire; and his large limbs were still very powerful, although their elasticity had departed. Perhaps, if he had not been so strong, his fellow-workmen would not have paid him such respect; at all events, it pleased them to see in this old fellow, who had been brought up to no such trade, a skilful quarryman, who used the heaviest tools by choice.

In Ellen's basket there was neither beer nor spirits, but she took from it a glass tumbler—a vessel unknown among the other tenants of the top level, who used horn and tin—and having filled it with water from a spring that trickled over the rock, placed it by her grandfather's side. Scarcely had she done so, when a splinter flying from some rock where the men were resuming work, fell upon it and shattered it to atoms.

'My only glass,' was the old man's bitter comment. 'Misfortune never forgets me in small things as well as'——

'Sir, I thank you.'

Stanhope had marked the catastrophe, and stepping hastily forward, offered the silver bottom of his pocket-flask in place of the broken tumbler.

'If you will permit me to fill it with sherry instead of water,' said he politely—'I have more here than I require.'

'Nay, sir; I do not drink wine—at present,' responded the old man stiffly; 'and yet, since you are so courteous—yes, I will just taste it.' It was curious to see his look at the costly cup ere he put his lips to its contents. They had not touched silver (he was thinking) for half a century. How excellent was this liquor, the like of which (though it was but hotel sherry) had been so long a stranger to his palate. He had intended just to sip a little, but now he slowly drained the delicious draught to the lees. As he gave back the empty cup to Stanhope, his eye caught sight of something engraved upon it. 'Is that your name, sir?' inquired he with sudden interest.

'Yes; and my address—Herbert Stanhope, Curlew Hall, at your service.'

'Oh, indeed,' returned the old man with an affectation of unconcern, while his face, bronzed with sun and wind, turned suddenly quite pale.—'Good-morning, sir, and thank you: it's time for me to begin work again.'

With that he took up his accustomed weapon; but the visitor, who, at this hint, had retired to some distance, noticed that he did not make a stroke with it for several minutes, but stood leaning on the long handle, as if in thought. Stanhope looked round for the girl, but she had disappeared; and then for the overlooker, but he had also slipped away; so, shrugging his shoulders, he lighted a cigar, and betook himself down the unprotected incline, notwithstanding that a bugle had just blown to give warning to all to seek shelter.

A general opinion was thereupon expressed in the Welsh dialect among the occupants of the top level that their recent visitor was a cool hand, and it was not the first time that that observation had in other high circles been made with reason upon Mr Herbert Stanhope.

Not a quarter of a mile from this same populous spot, Slogan was as solitary as Sahara. You had only to turn the northern corner of the crag, and take the steep but winding footpath that led upwards, to find yourself out of all human sight and hearing. This would have been the case with Ellen Blackburn, already started on her homeward journey, but for the presence of John Denton, who had accompanied her so far, in order to carry her basket for her, and assist her up the cliff; a work which, considering that the basket was empty, and the young girl, although so delicate-looking, as agile as a chamois, may be set down as one of supererogation.

Digitized by Google

'There, John, that will do,' said she; 'I will not have you come any farther. As it is, you have wasted half your dinner-hour.'

'I need no dinner,' said John quietly. 'The sight of you is meat and drink to me.'

'But you are also neglecting your duty, Mr Overlooker,' urged she with a charming pretence of rigour.

'No, I'm not; I'm *overlooking* them all now,' said John with twinkling eyes; for a little joke went a great way with this excellent young fellow. 'I don't intend to let you cross the mountain alone to-day, Ellen. There are hawks abroad, and I mean to see my pretty one safe to her dovecot. You need not look up at the sky for a buzzard. You know as well as I do what I mean; the bud upon your cheek is blowing, blowing into a bonny, bonny rose-blush. There! Yes, Ellen, I saw him stare at you, the insolent hound. We want no scented gentlemen of that sort on honest Slogan. I wish the big hotel yonder had never been built to harbour such folks, though its stones did come out of our quarry.'

'It appears to me,' said the young girl gravely, 'that Mr John Denton is jealous.'

'No, darling; it is not that. Only it makes me sick to see these idle supercilious scoundrels wasting their own time, as well as that of everybody they come across, simply because they have nothing to do but mischief. It angers me to have to listen to their long-drawn stupid drawl, not to mention the opinions (if they can be called such) with which they are sure to favour one, and which are simply infamous. If I had my will, there should be no such drones among us at all.'

'What! you would blow the whole hive to pieces with your favourite gunpowder, eh, John, sooner than not destroy them? Poor drones! and would you sweep away all the butterflies also?' and she pointed laughingly to an exquisite creature of that species, a very embodiment of light, and joy, and colour, flitting from sunlit stone to stone across their path.

'No, dear, I would not,' responded the young man; 'because, although I am not aware that butterflies are useful, in their beauty and in their grace they remind me of you. I said I was not jealous, nor am I, because I think you just the truest-hearted girl that ever breathed mountain air. Else, where rank is concerned, or even a little social superiority in the way of money, you women are as weak as water: of course, you would never disgrace yourself like Phœbe Morgan or Alice Jones—but, I sometimes think that even in your case, if you were suddenly to become rich, Ellen, and I was just as I am now, or, perhaps, a trifle more prosperous' (this was added with a certain pride), 'you might ask yourself whether you might not have looked a little higher—on such a young fellow, for instance, as we have just left down yonder, with a grand air, and well-fitting clothes, and pretty boots, and a sort of'——

She stopped him short with a grave face, and her slim fingers upon his wrist: 'And do you really think such things as that of *me*, John Denton?'

'I can't help *thinking*, Nelly. Don't be angry with me. *I* tease myself, as lovers do, with foolish thoughts of losing you—that's all.'

The firm strong voice of the overlooker had softened into speech as gentle as her own; his fine eyes were full of tenderness; and his hand trembled in her grasp.

'I think that must be all, indeed,' said she; 'but I am sorry even for that much. I do not tease myself with such thoughts of *you*, John. I feel quite sure, that though you should get to be as wealthy as Mr Rhys, who is king of Slogan, or were made the engineer to the great railway that is coming, at thousands a year, you would still take Ellen Blackburn for your wife, penniless as she is, and notwithstanding the shame that clings'——

He placed his finger gently on her lips, and kissed her forehead. 'Hush, darling, hush! no word of that. You are quite right. I have no other aim in life but to make you mine; and yet—although Heaven knows I have yearned for you—I have preferred to wait until I had earned something: until I had built a wall to shield you from the bitter wind of want, so solid that it should keep my darling safe for ever.'

'Do not set your mind so much on wealth, John,' returned the young girl seriously. 'I have every day the evil of that before my eyes.'

'Yes, Ellen; but what your poor grandfather longs for is a will-o'-the-wisp. I heard even to-day that this young Richard Blackburn, into whose shoes he looks to step, is engaged to be married. Whereas, what I have fixed my eyes on is a reality; the dream of *my life* has already come true, thank God! I have been promised an appointment upon this very railway of which you spoke. Mr Rhys put the letter in my hands only last night; and when I have got it, Ellen, and I am sure to get it—look at me face to face—put your hands in mine—now answer me: will you be John Denton's wife in three months hence?'

'You know I will,' said she with a bright blush as he folded her in his arms; 'that is, if you can get my grandfather's consent. To him I owe everything in life, John, and I am sure you would not wish me to forget it.'

'There is no fear of your grandfather, Ellen, since I shall have your grandmother on my side,' said the young man confidently. 'It is to tell her this news that I am crossing Slogan with you to-day, and have left my men to take care of themselves. I think that two hundred a year and a house with eight rooms will recommend me to her good graces, eh? To think that five years ago I was but a pupil-teacher—though at the same school with you, darling, and therefore well placed enough—without a penny in the world!' and Denton's face glowed with conscious triumph.

'And I have not a penny still,' said the young girl sadly.

'Nay, you have what *I* have, my darling; "with all my worldly goods I thee endow;" that's in the marriage-service, you know.—Oh, tell me,' continued he with unwonted fervour, 'are you as happy as I? Did the heather ever seem so springy beneath your feet, or the sky so bright above your head? And does not *our* sky, too, appear without a cloud, my darling?'

'It is very bright, dear John,' answered she with a grave smile, 'and I am very happy; but it is not without a cloud.'

'I guess what you mean,' said he; 'but I do not see why the fact of your uncle being an unsatisfactory sort of person—well, a scoundrel, if one must call things by their right names—should

Digitized by Google

interpose between us and the sunshine. Why, the greatest people of this country, my dear, are mostly sprung from scoundrels—Norman robbers, courtly jobbers, and state intriguers of all sorts—and are certainly not thought the less of upon that account. Then, why should you and I distress ourselves about Uncle Will? Let us think of nothing but what is pleasant. See, upon your cottage window yonder, how the sun is glinting—the brightest welcome, notwithstanding that you are not within it, that it has ever beamed on me. It is surely an omen for good.'

CHAPTER III.—MOOR COTTAGE.

The cottage to which John Denton had ascribed the gift of augury was a homely one enough, but still superior to those inhabited by quarrymen generally. It had been once the residence of the bailiff of a great sheep-farmer; but since Slogan had borne a more profitable crop than scanty fleeces, the house had been unoccupied, and was rented very cheaply, by reason of its desolate and out-of-the-way position. It was fully three miles from any other residence, and set in the very heart of the hills. Not a tree, not a shrub grew near it, although in a deep gully close beside it were hid a few mountain-ashes; but yet in summer-time, as now, eye could scarcely light on a more charming spot. Rich people in town would have given much to be transported thither for a single August day. If the air could only have been bottled—as perhaps may happen some day—and the sunshine hermetically preserved within, it would have fetched guineas a dozen; and as it was, the view from the cottage door had been photographed, and delighted many a beholder who had never stood there in the flesh. A waste of purple moorland stretched before it, fringed to westward by a long jagged line of hills, beyond which rose still higher ranges, that in most days were lost in cloudland, but now stood out with the utmost clearness, each slab of stone distinct in its mountain wall. To the north, rose Slogan, immense, imperial; a giant cone unscathed on this side by man's ravages; to the east, lay the glittering ocean; and on the south, a promontory stretched far seaward, in the hollow of whose sandy bay a little town sparkled like a jewel.

Nature, however, which had thus put forth her best efforts to enhance this mountain dwelling, was but ill assisted by Art. The house—a one-storied building, with a roof of thatch, on which great stones were placed (as though it had been a mark for aërolites), to secure it against the violent winds—boasted but six small and scantily furnished rooms. Even in summer, the rough wind forced its way through the ill-fitting door and crazy windows, while in winter matters were wretched indeed; and it was to the inclemency of Moor Cottage that Ellen Blackburn chiefly owed her pale features and delicate frame. The fireplaces were not built upon scientific principles, and the peat-smoke, instead of taking the road provided for it to the upper air, wandered through the house, filling it with a cough-provoking haze, and blackening the low ceilings. The picturesqueness of the family poverty, in short (as usual), ceased with the external surroundings. Nor was the meanness or discomfort of the interior of the cottage redeemed by its solitary female inmate, who could now be discerned by the young couple, as they drew near, standing in the doorway, and screening her eyes with her hand from the glare of the sun. She was watching them intently, and a gleam of satisfaction sat on her large and somewhat coarse features as she did so. Age and poor living do not improve folk's looks, and it was difficult to detect in that bony frame, and that ruddy but haggard face, even the faintest traces of the beauty for which Anthony Blackburn, in the heyday of his early manhood, had lost caste and fortune. Yet, fifty years ago, Mary Gryll had been the village beauty of the place where Anthony was the young squire: tall and finely proportioned; dark as a gipsy, but with a tenderness of expression in her splendid eyes that never gipsy wore. Even now her eyes were brilliant, and perhaps looked the more so by contrast with the loose and shrivelled skin in which they were set. Her teeth, too, were very regular and perfect, for one who had lived so long on such hard fare. Otherwise, there was nothing to distinguish her from any of her age and class, upon whom the primal curse of a too toilsome life seems to have fallen more heavily than on the sex against which it was pronounced. Her dress was sordid and ragged; and as she stood with her sleeves rolled half-way up her arms, it was only too manifest that personal cleanliness was no longer one of Mrs Blackburn's virtues.

She welcomed John Denton very heartily, and dusted a chair for his reception in spite of his efforts to prevent her. It did her good, she said, to see him, almost as much (she added with a sly look) as it did her grand-daughter. How kind it was of him to leave the works where he was always so busy, to accompany Ellen across the moor. It was evident, in short, that Mrs Blackburn was anxious as ever was Belgravian mother in the case of an eligible *parti*, to encourage the young overlooker in the prosecution of his addresses, and that she did not even need to hear the good news he brought with him to favour his suit.

That two hundred a year, indeed, with the house with eight rooms, seemed to sound in her ears as almost too great a stroke of fortune, for after one involuntary lifting up of her hands, she began sighing and shaking her head.

'Ah, well,' said she, 'then, I suppose, this is the last visit as you will pay us poor folks, Mr Denton? You will be too proud and too great a man to come to Moor Cottage, I warrant; for that's only the way of the world.'

'I don't know as to that, Mrs Blackburn,' returned the overlooker with some indignation, for he did not understand the feminine craft of his hostess; 'but it is not *my* way, I do assure you: if I was ever so rich, I should be only proud because I had the wealth to offer Ellen. I value her far above house and income, and it was only for her sake that I have waited until I had won them, to ask your consent to our marriage.'

'And that you shall have, John Denton,' returned Mrs Blackburn enthusiastically, while she held out her two huge hands for him to shake. 'I won't kiss you,' chuckled she, 'because I daresay you had rather that that were done by deputy.'

Not to contradict a lady and his grandmother-in-law-elect to boot, John applied to the proxy thus indicated upon the spot, who executed the order accordingly, though not without some modest diffidence.

Digitized by Google

'Deary me!' continued the old woman approvingly, 'how much better is this, Ellen—a hard-working, well-to-do young fellow, with his nice little income, and house with eight rooms—not more than you will want in time, young people, I daresay—than any of those fancy matches which your grandfather is always inventing for you, with the great folks of Derbyshire! A bird in the hand is worth two in the bush—that's my motto. I've lived on hopes too long myself not to know it's but lean meat. There's some as likes castles in the air, but I'd exchange the very finest of them, with park and grounds complete, for an eight-roomed house built of Slogan stone! Money we have not to offer with your bride, John; but I am an old housewife, and shall be able to come and give you many a hint or two as to this and that, which will help to save, if not to get.'

'Indeed, Mrs Blackburn, we shall be glad to make use of any hint you may please to give us,' returned John, whose naturally keen perceptions were entirely blunted for the time by the contiguity of his charmer, or he would surely not have thus surrendered hearth and home at discretion at the first blast of a grandmother-in-law's trumpet.

'You speak, I'm sure, most fair and kind,' said the old woman; 'and it's quite a pleasure to listen to such talk, after having nothing but complaints so long, and looking for nothing but disappointments: you shall have my good word, and welcome, with my husband, John Denton; and all I can say is, that if his answer is not "yes," when you ask for our Ellen, he must be downright deprived of his wits. I thought him foolish enough in opposing you of old (for I have always stood your friend with him); but now, if he objects to you still, being in such an excellent position, I shall get out of all patience, and speak my mind right out. However, let us hope he will not thus fly in the face of Providence.'

'Amen!' answered Denton with a grave smile. 'But, at all events, I do not think he will oppose himself to our happiness, for a certain reason, for which I should otherwise—for his sake—be sorry. I have heard to-day that young Mr Richard Blackburn *is* engaged to be married.'

'They Blackburns are always for marrying early,' said the old woman bitterly. 'But there, it's not for me to complain,' added she with a sigh. 'I will do Anthony the justice to say that, during all his trouble, he has never once reproached *me*, but only his own unnatural kin.—Going to marry, is he? and without a father to say him nay to whomsoever he chooses. *She* will not be flattered with hopes of being a grand lady, and then find herself even worse off than the poor stock from which she sprang. Her boys will be brought up delicately, out of the reach of all temptation—leastways, to do such things as the law takes count of.' Here the old woman's rough tones became strangely soft and pitiful, and her eyes filled with tears. 'There's a verse in the Bible somewhere as says that "The destruction of the poor is their poverty;" I wonder whether the rich ever read it, or know what it means.'

Denton and Ellen kept silence; but the latter rose, and put her arms about her grandmother's neck, and kissed her.

'You're a good girl, Ellen,' said the old woman quietly. 'Your father was a good man—too good for this world—and you take after him. But all of us are not born so gentle and enduring. Even John here, had he been tried as some has been tried'——

'Nay, grandmother, why should we talk of these things now?' pleaded the young girl.

'Ah, why, indeed,' responded Mrs Blackburn; 'why think of the absent and the erring, when all is going so smoothly with ourselves? That is what your grandfather says—although, Heaven knows, it is not because things go so smoothly with *him;* sixty-eight, and nothing saved against the poor-house'——

'What!' interrupted Denton suddenly. 'Do you think it possible, Mrs Blackburn, that I should permit those who had brought up my darling here so well and loyally, to come to such a pass as that? For the future, when you think upon your granddaughter, I beg of you to remember that you have a grandson also.'

'I thank you, John Denton, but I have a son of my own alive,' was the cold reply; and with that Mrs Blackburn stepped firmly across the room, and went out at the open door, while the two young people looked at one another with mutual embarrassment. The poor woman's pride supported her until she was out of their sight and hearing; but as soon as she reached the little gully of which we have spoken, and which was the only place of concealment for miles around, she sat down beneath one of the mountain-ashes, and sobbed as though her heart would break.

'O Willy, Willy,' cried she, wringing her large gaunt hands, 'why is it I cannot give them the lie, when men speak evil against you, and why must a stranger and not you be your parents' prop?'

As she sat moaning thus with her face in her hands, and rocking herself to and fro, she was unconscious of the approach of a little ragged boy, who came whistling leisurely up the glen. He addressed her twice, and even shook her arm before he could gain her attention. 'Here's a letter for you, missis,' said he, holding out a missive which had not a little suffered from contact with his dirty hands.

'For me?' cried she, snatching at it eagerly. 'Oh, is it from my Willy?'

'How should I know, unless I read it?' answered the young gentleman scornfully. 'And I think I ought to get summat extra for that. The postman says as how you were to pay me fourpence—'cause you're beyond the delivery. Mr Blackburn always pays that, he says, for all his letters, and it don't come to a thousand a year neither even at that price.'

'I'll go in and get the money, my lad,' said Mrs Blackburn, staring at the envelope she held tightly in her hand, and too deeply lost in thought to be cognizant of the small messenger's impertinence. 'Who can be writing to Anthony?' muttered she. 'It is surely the same hand that wrote the news of Richard Blackburn's death, and like it, it has a black rim!' As she looked up thoughtfully, she beheld far across the moor the form of John Denton striding swiftly away in the direction of Slogan. 'That's well,' mused she. 'I could never have kept it from him that something had come. How my poor hand shakes, and how my knees tremble under me!'

'Come, missis; I was told not to give up the letter without the fourpence,' resumed the shrill

Digitized by Google

voice of the boy. 'You must please to fork out the money.'

'You shall have sixpence, if you'll only wait a minute,' gasped the old woman; 'that will be twopence for yourself.' Then she fell to turning the letter over and over, and feeling it about. 'It has something in it,' said she softly, 'or it must be a very long letter, and folks don't write long letters to beggars like us.' Then she looked upward to the blue sky, and into her eyes came an ineffable tenderness that brought back to them for an instant their beauty of half a century ago.

'If Anthony is right after all,' ejaculated she—'O dear, if he is really right, my Willy will come back to us again!' and still keeping her gaze fixed upon the letter, she slowly turned towards the cottage.

A TWO-WHEELED STEED.

I AM not ashamed to admit having always cherished a peculiar admiration, at one time amounting to awe, for anything that would go round. A wheel has never been without its charm for me. I remember, at school, the affection with which I regarded wheels of all sorts, and how all my favourite toys as a child were rotary ones. The knife-grinder who used periodically to stop in front of our play-ground gates to grind the young gentlemen's knives, has probably died without knowing the inward comfort he administered to my breast, through the opportunities he afforded me of seeing his wheel go round at public expense.

Only the other day, I confided to an old friend that I still possessed a sneaking regard for wheels, and though he rewarded my confidence with a pitiful sneer, I know that this wretched old hypocrite himself keeps a wonderful brass top that will spin for an hour, under a glass case on his study-table, and in secret delights to watch it in motion.

A clever marine engineer, who loves wheels too, once told me with great gravity that the human mind has never yet discovered anything so wonderful as the principle of the common wheelbarrow, 'an invention,' he said, 'to which that of the steam-engine itself is nothing. The wheelbarrow,' he went on, 'is the only example I am acquainted with in which the very weight of a load is fairly utilised as a locomotive power.' There was a copy of *Punch* on my table. Our conversation had turned to the subject of wheelbarrows from looking at Mr Keene's vignette, in which, some three years ago, Mr Punch was depicted as Blondin, but performing the impossible feat of wheeling *himself* in a wheelbarrow along a tight-rope in the Crystal Palace transept. My engineer friend then remarked that, putting aside the tight-rope business, he was firmly convinced that Mr Keene had in jest represented what would by-and-by be accepted in serious earnest as the only correct principle on which to construct a self-driven vehicle—namely, employing the *weight of the body* as a propelling power, and relying on the fact of motion as the means of balance. One thing will at least be conceded by any person who will take the trouble to turn to the sketch, and that is, notwithstanding all recognised notions and experience to the contrary, the picture of a man driving himself in a wheelbarrow looks strangely plausible, probably from the fact, that the mind of the observer communicates motion to the wheel, and is satisfied to receive that as the explanation of the balance.

The two-wheeled velocipede or bicycle is in part a realisation of Mr Keene's picture. It depends upon motion for its balance. The two wheels, one in front of the other, with a saddle between, whether mounted by a rider or not, will not stand upright for a single instant at rest; but, like the boy's hoop, *being kept trolling*, they maintain a perfect equilibrium.

The bicycle can hardly be called a 'new invention,' being to a great extent a modification of that very old toy-vehicle of our fathers, the hobby-horse, whereon the rider used to sit and row himself along, so to speak, by paddling with his feet on the ground; at the same time, the entire reliance on the principle that motion would be, under any circumstances, sufficient to produce balance, is sufficiently novel almost to justify the use of such a term. The French appear to be entitled to whatever of credit attaches to the original invention of the hobby-horse (a miserable steed at best, which wore out the toes of a pair of boots at every journey. M. Blanchard, the celebrated aëronaut, and M. Masurier conjointly manufactured the first of these machines in 1779, which was then described as 'a wonder which drove all Paris mad.' The French are probably justified, moreover, in claiming as their own the development of this crude invention into the present velocipede, for, in 1862, a M. Rivière, a French subject, residing in England, deposited in the British Patent Office a minute specification of a machine identical with that now in use. His description was, however, unaccompanied by any drawing or sketch, and he seems to have taken no further steps in the matter than to register a theory which he never carried into practice. Subsequently, the bicycle was re-invented by the French and by the Americans almost simultaneously, and indeed, both nations claim priority in introducing it. It came into public notoriety at the last French International Exhibition, from which time the rage for them has gradually developed itself, until in this present 1869, it may be said, much as it was a century ago, that Paris has again been driven mad on velocipedes.

Extensive foundries are now established in Paris for the sole purpose of supplying the iron-work, while some scores of large manufactories are taxing their utmost resources to meet the daily increasing demand for these vehicles. The prices of good serviceable velocipedes range from two hundred and fifty to four hundred francs (ten to sixteen pounds), at a less price than which a really good machine cannot be obtained either in England or France. The best French pattern is that of Michaux et Cie., which is the one now adopted by most of the English builders with more or less correctness. The height of the driving-wheel most suitable for general use is three feet.

The advantages of the bicycle over the three and four wheeled velocipedes are many and considerable. It is less than half the weight of the old machine, being but a little over forty pounds; and the friction is reduced to something like two-thirds. The power operating directly on the cranks, instead of being communicated through long levers, is wholly utilised, whilst the motion of the feet is more analogous to that of walking. When once accustomed to the use of the

Digitized by Google

two-wheeled velocipede, it is not at all fatiguing, whereas the many-wheelers condemn their riders to a term of hard labour. As the result of several months' experience in driving a bicycle, I have no hesitation in estimating it as a clear gain of five to one in comparison with walking; that is to say, the rider may go five miles with the same expenditure of labour as in walking one, and after a journey of fifty miles he will feel no more fatigue than after having walked ten. Notwithstanding appearances to the contrary to the unaccustomed eye, the bicycle is, moreover, a *safer* machine than any velocipede with three wheels, and far more under control. To turn a corner with a three-wheeler at anything like speed, is a most hazardous experiment, resulting almost certainly in a 'spill'—because the speed lifts the hind-wheel describing the outermost circle, from the ground; whereas the two-wheeler, when on the turn, stands at an inclination like a skater's body, more or less acute according to the quickness of the curve to be described.

With regard to the speed which may be attained, fifteen miles an hour, under the most favourable circumstances, that is, good hard road, *not* level, but without very steep hills, and no wind blowing, is probably the limit of the velocipede's powers; but a pace of nine or ten miles an hour may be maintained for five or six hours without distress. Long journeys on level road are perhaps the most fatiguing, on account of their monotony, because then the feet, as in walking, are nearly always at work. Still, even in this case, the driver can maintain his speed with one foot, resting the other on the leg-rest; or, if disposed, he may even place both feet on the rests, and run four or five hundred yards without working at all. The slightly increased labour of climbing a hill is nothing to the zest imparted by a knowledge that there is sure to be a hill the other side to go down, and *that* is the most luxurious travelling that can be imagined. Descending an incline at full speed, balanced on a beautifully tempered steel spring that takes every jolt from the road — wheels spinning over the ground so lightly they scarce seem to touch it—the driver's legs rested comfortably on the cross-bar in front—shooting the hill at a speed of thirty or forty miles an hour—the sensation is only comparable to that of flying, and is worth all the pains it costs in learning to experience it. The velocipedist feels but one pang when he reaches the bottom of a hill, and that is, that it is over; and but one exquisite wish, which is, that the entire country might somehow become metamorphosed into down-hill. But the hill is bountiful even after one has left it, for the impetus derived from a good incline will carry the rider at least the hill's length on level ground before he need remove his feet from the rests and commence working again. The slightest incline on a good road is sufficient to obviate all necessity for working with the feet, so that what little labour there is (and it is of the easiest), is by no means incessant. In a journey of twenty miles on good road, a driver should not work more than twelve—the inclines do the rest. Of course, there are hills so steep that to ascend them is impossible: yet, for myself, living in a hilly county, which I have pretty well explored on my two-wheeled steed, I can reckon up their number on the fingers of one hand. There are also hills where the labour becomes as much as, or more than, walking, but these must be of a gradient something like one in twelve, and such hills are not frequent. When they do occur, the rider may, if he will, dismount. It is a subject of smiling pity to many of the uninitiated to behold a velocipedist dragging his horse after him up a hill—and cruelly realised, too, in the case of three and four wheeled machines; but the bicycle is better than any walking-stick to assist a person up an incline, even when only walking beside it. Resting one elbow on the saddle, and leaning the weight of the body on that, while guiding the handle with the other hand, the machine becomes a positive assistance instead of an incumbrance. This sounds like fiction, but it is fact. *Experto crede.*

There are persons who advertise to teach the use of the velocipede in 'a few hours.' Not long ago an enterprising French master advertised to teach the French language (in the intervals of sea-sickness) during the voyage from Dover to Calais. It should not be concealed that it requires as much time to learn the use of the bicycle as to learn to skate—and there are also occasional falls incidental to learning either. To urge the time necessary to acquire its use as an objection against the two-wheeled steed, would, however, be manifestly unjust. So difficult is it to balance the human body on merely two small legs and a pair of feet, in an upright position (a position such as would be scarcely possible to make an exact model of a man, even *without* life, retain for a single instant), that it has taken most of us a twelvemonth to learn how to do *that*. It is sufficient to say that a person may attain the management of a two-wheeled steed in less time than that of a four-footed one, and when he has done so, for speed, endurance, and inexpensiveness, the former will at least bear favourable comparison with the latter. As in skating, a week's steady and persevering practice is needful to acquire a comfortable balance, and gain control over the unaccustomed form of support. The 'falls' referred to above, as happening in learning the velocipede, are nothing to those incurred in learning to skate. No one should mount a bicycle until he is acquainted with the way to get off, which is really the first lesson. Whichever way the machine is going to fall, the learner has only to put out his foot on that side. His foot being not more than three inches from the ground, the horse, in the act of falling, will deliver him safe on *terra firma*, if he will only let it, whilst, by retaining his grasp of the handles, the rider at once balances himself on alighting, and saves the velocipede from falling. Some difficulty in remounting without help is sure to be experienced by a learner. For a month he must content himself with the assistance of the first post or gate or palings he sees by the wayside; but he will soon discard such assistance, and be able to vault on the saddle whilst his horse is in motion. Good hard road is essential for velocipede-driving. In muddy or loose gravelly road, the work becomes proportionately laborious. But with good 'going ground,' it is difficult to convey how little labour is really required to maintain a high rate of speed—in fact, the great trouble with beginners is to get them to restrain the expenditure of muscular force. Velocipede-driving is, I believe from experience, most healthy and exhilarating, since it exercises all the muscles of the limbs in a manner much more

Digitized by Google

uniform than would at first be credited, and certainly without undue strain on any part of the body. To the spectator, the velocipedist appears almost wholly to employ his legs, but in reality the muscles of the arms are in strong tension in the act of grasping the handles, so as to counteract the motion of the feet on the pedals, which motion would otherwise tend to sway the wheel from side to side. In fact, after a long journey, the driver will feel more fatigue in his arms than in his legs. Once mastered, the two-wheeled steed is a docile and tractable animal, equally sensitive to bit and bridle, and a sturdy friend to the traveller. For him the pike-men throw open their gates without asking for toll. He needs neither corn nor beans, nor hay nor straw, neither hostler nor stableman. His stable is a bit of the passage-wall, against which he reposes, without taking up any room, until his master needs him again—his only food, a pennyworth of neat's-foot oil per month.

There is a Japanese sauce surnamed the 'Maker to Eat.' It will have little charm to the palate of him who drives a bicycle; for, be he the veriest epicure of the epicurean sort, he will, after a three hours' run, possess an appetite to which the most homely bread and cheese appears dainty.

At present, the bicycle is regarded, in England, very much in the light of a toy, and its practice as a pastime: not so in Paris and New York, where persons of all grades may be seen solemnly and seriously going to their daily business on two wheels. Now that the supposition about the new velocipedes frightening horses has been proved to be groundless, there seems little reason to doubt they will become equally popular in this country; and that after the first 'rage' for the novelty has died away, the two-wheeled steed may drop into its proper place as a serviceable nag, that can do a great deal of work in a very little time, and, after the first cost, at a very inconsiderable expense.

HISTORY *VIÂ* POETRY.

IN TWO PARTS.—PART I.

When a great statesman (as has been more than once the case of late) puts forth a poem, or a theological essay, or when an actor, whose rôle has hitherto been comedy, essays to play Lear, we who have admired each in his proper part, are more curious than hopeful to see how they will acquit themselves under their new circumstances. We think of the great Wellington's statesmanship, of Liston, who would persist in maintaining that his genius was tragic, and of cobblers generally who have gone into the hat trade; but still we are very curious and expectant. It was with some such expectancy, some such doubt, that we saw advertised *Chaucer's England*, by Matthew Browne,* remembering that the same *nom de plume* was annexed to that most charming of booklets, *Liliput Levee*. What might not be expected in the way of humour, frolicsome glee, and pathos from that Laureate of the Little Folks; but then, on the other hand, only think of his writing a history! Dates! genealogies! products (tallow, hides, flax, &c.)! *Chaucer's England* too! Edward III.'s England, with *such* maps, and illustrations with women with horns, and men with toes tied to their knees, all out of perspective! It must surely, thought we, be only another delightful book for the young people.

And it is a delightful book, though not for the nursery. It is a strange plan to begin with, this proving of the Past upon the unconscious evidence of a poet, this reaping our information from the fields of song; but in Chaucer's case it is less difficult, perhaps, than from any other English verse-writer. It would be hopeless indeed for some future Matthew Browne to found a theory of how men and women in England lived to-day from the works of Tennyson or Browning. They are 'suggestive' enough indeed, but scarcely of solid matters of fact; whereas Chaucer was essentially the poet of observation. He sang of what he saw; of the visible external world around him; he drew such pictures of his time as Hogarth drew, except—and a very wide difference it is, though by no means a disadvantage to the duly qualified historical student—that he was also a poet. Everybody knows Chaucer was occasionally a coarse writer—and something worse. He has published his own disclaimer. 'God have mercy on me,' he says, 'and forgeve me my giltes, and nameliche my translaciouns and of endityng in worldly vanitees, whiche I revoke in my retraccioun, as is the book of Troyles, the book also of Fame, the book of twenty-five Ladies, the book of the Duchesses, the book of seint Valentines day and of the Parlement of briddes, the Tales of Caunterbury, alle thilke that sounen into synne, the book of the Leo, and many other bokes, if thay were in my mynde or remembraunce, and many a song and many a leccherous lay, of the whiche Crist for his grete mercy forgeve me the synnes.' In his youth, he wrote very loosely; in his manhood, loosely; in his old age, with gravity and repentance. But even this, as our author shews, is a curious corroboration of what we know of his times. 'He was too receptive a person not to take to that portion of the faith of his day which made repentance and bead-telling and a hortatory disposition the proper things in an old man. We, who look upon faith, devotion, and repentance of wrong-doing as things for the whole of a man's life, and not for his old age only, cannot help smiling at the medieval view of the subject. But we must take care not to smile unkindly. The whole theory of life and duty in those days was one of classification of persons, functions, seasons, foods, and occupations. That one part of life was intended to be more religiously lived out than another, would not seem so very absurd to a man whose church told him to eat no flesh on Wednesdays and Fridays, and gave him absolution for confessed sin upon penance done as often as he liked to come for it. In the middle ages, caste was moral as well as social and civic. The knight was to put lance in rest; the clerk was to be learned, "morall of sentaunce;" the parson was to preach, and to be a great deal more religious than his people; while those that "ben seculare" may, by the side of all this, do pretty much as they please. This is the organisation of life; virtues and offices are divided and apportioned; and the church overlooks the motley throng with blessing or ban in her power.'

Whatever Englishmen were in his own day, that we may be pretty sure Chaucer was: he is the most English of all our writers. Even his

* London: Hurst and Blackett.

Digitized by Google

coarseness (which is certainly a national quality) may be partly excused upon that ground. He is a thorough 'good fellow.' 'His poetry is penetrated with the social spirit. He loves the haunts of men, the places where they dwell, the episodes of mutual need that bring and keep them together; meat and drink; industry and play; the uprisings and downsittings, the incomings and outgoings of men and women. . . . . A steady breeze of strong human feeling flows through his writing; he keeps you in the open air of life. Thus Chaucer, as an author, seems, even though he wrote in verse, especially fitted as a witness in the case we are considering, the habits of life of our ancestors of five hundred years ago. His social position also gave him peculiar opportunities of observation. 'He was a gentleman, a courtier, an ambassador, and a soldier; perhaps a man of business too, though we have no means of knowing *how* he filled the public offices which he held under the crown during some portions of his life. His descriptions of life and pictures of character could only have come from a writer who was a man of the world (as well as a scholar and a poet); he was connected by various links with persons and events which are prominent in one of the most splendid eras of English history; and his *Canterbury Tales* contain, more "Englishness" than any other poem in the language. For these reasons, he may fairly be taken as a typical person, so that no impertinence can be charged against such a title as *Chaucer's England*.'

In this book will be found the most exquisite appreciation of the poetry of Chaucer that it has yet received, not even excepting the graceful introduction of him by Leigh Hunt, who has acted as master of the ceremonies to so many poets, who, but for him, would be '*caviare* to the general.' Mr Browne reminds us of that bright affectionate writer very strongly: he has inherited his graceful fancy, his subtle yet sprightly wit, and also (for which we do not admire him the less) that excessive delicacy of appreciation which dull critics have termed 'finical.' In order to the complete enjoyment of the Chaucerian music, says our author gravely, 'the reader undoubtedly ought to know a little French, a little German, and perhaps' [think of this!] '*perhaps a little Anglo-Saxon*.' This is Leigh Hunt again, all over, and reminds one of his recommendation to use at family prayer (although he owns the thing *can* be done without it) 'some musical instrument, *such as a seraphine*.'

As most people are unacquainted with Anglo-Saxon, and are not likely to 'go in' for it, even with the object of 'the complete enjoyment of the Chaucerian music,' we shall use Mr Browne's translation when necessary, instead of quoting the poet's words. His style is equal to that of our best historians. This is how the time of Chaucer is introduced to us. 'The chimney is added to the house, the glass-window replaces the lattice or the shutter; the gun threatens the bow and arrow with extinction; Adam Scrivener "lothly" lays down his penner when the click of movable types becomes loud; dress begins to *think* of lopping off its entangling superfluities, and suiting itself to the wants of a people going busily to and fro; the dignity and prestige of the priestly person is threatened, and more remotely that of the soldier, an element clearly traceable in the spirit of the times; lastly, religious persecution lights the torch to burn the heretic—and we feel that we are in England. To-morrow the first printing-press will be set up under the shadow of Westminster Abbey; and after the Bible, Chaucer's *Canterbury Tales* will be the first book printed.' It has been objected to this great poet that his thoughts are often without originality, merely the clothing of a saw or a truism in verse; but even this, as our author shews, was an illustration of the times. 'In his time, the very idea of originality as a supreme merit in literature had not taken possession of men's minds. The merit of a "clerk" in those days was to know what other men had written. His own peculiar skill was shewn in selection—unless he had genius, as Chaucer had, in which case the genius did its own work more or less unconsciously, and gave invention *in*—the originality was in excess of the bargain between him and his readers, but there it was.' Chaucer's own ideas of true worth were only too original—as compared with the flimsy and conventional notions of it which we find so prevalent to-day. Five hundred years before Burns wrote 'the rank is but the guinea's *stamp*, the man 's the gowd for a' that,' Chaucer wrote:

> Vice may welle be heyre to olde richesse,
> But there may no man, as ye may wel see,
> Byquethe his sone his vertuous noblesse;
> That is approperid to no degree,
> But to the firste Fader in Magestee,
> Which maketh His heires hem that doone Him queme,
> Al were he miter, corone or diademe.

Such arrogance, says he (in the *Wife of Bath's Tale*), as pride of birth is 'not worth a hen.'

> *Look who that is most vertuous alway,*
> Privé and pert, *and most entendith ay*
> *To do the gentil dedes that he can,*
> *Tak him for the grettest gentil man.*
> *Christ wol we clayme of him oure gentilesse.*

We are apt to imagine that the medieval times were much more influenced by caste than our own, but, as our author takes occasion to shew, the social feeling was much more active than the caste feeling. Human beings were thrown more *directly* upon each other for much of the help which they can now obtain at second-hand. People of diverse rank and culture were drawn together in a thousand ways, where they would now be apart; and 'high and low, layman and clerk, lady and soldier, would be kept in presence of the primordial facts of life, at no great distance from each other. The word truckle-bed would alone furnish a text for a discussion on this subject. The truckle-bed was a small low bed on truckles, which was placed at the foot of the great or state bed of a person of consequence. In the smaller bed would sleep the esquire of the knight, or the henchman of the esquire, ready to help his superior in the night, in rising, or in going to bed. Now this state of things, though it does not belong to an age of bell-ropes, gutta-percha tubing, dressing-rooms, and the like, is much more "human," and obviously brought people closer together. . . . . It must also be noted that, sharply drawn as were the lines of rank and station in the middle ages, the distinctions were kept up pretty much by superficial signs, which left the undermost roots of things very much the same in the consciousness of

Digitized by Google

all persons concerned. . . . . The superiority of the privileged classes was signified and guarded more by trappings and splendour of apparel and furniture than by fundamental differences in people's habits.' Thus the idea of the Canterbury pilgrims all going in cavalcade together, the Knight and the Miller, the Country Gentleman and the Bailiff, the Lady Abbess and the Wife of Bath, is not socially outrageous; and whether or not, it is positively certain the tales told on the pilgrimage contain, both in the prologue and the stories, 'some of the most exact pictures of English life that ever were transmitted at any time in English history, by any pen.'

Take, for instance, his description of the miller. In all old-fashioned song, the miller is a prominent personage, since he belonged to 'a time when the relations of the man who grew the corn, the man who ground it, and the people who ate the bread, were much more direct than they are now; in Chaucer's time, indeed, the miller was the immediate servant of the lord of the manor, to whom belonged the exclusive right of grinding the corn grown upon his estate. One almost always likes to read of him, too' [and here dear Leigh Hunt's voice is recognisable in every tone], 'because he can scarcely be mentioned without recalling the picture of the mill itself; ever, to my thinking, one of the prettiest spots in a landscape.' Well, Chaucer's miller is a rough fellow enough, one who, 'as Mr Carlyle says of Oliver Cromwell, is decidedly not of the "man-milliner" or "patent digester" species. He has plenty of bone and plenty of flesh; he is a wrestler who could always feel sure of bearing away the customary prize—a ram; short-necked, broad-shouldered, and with, presumably, short thick legs, for I believe when an ox is said to be short-shouldered the legs are short. He could heave up a door with his shoulders, or knock it in with his head by running at it—the sort of head for the game of singlestick, or quintin, or any other of the athletic sports which were common in Chaucer's days, and much later. The next touch is very characteristic: you can imagine the red, bristly beard, in shape like a spade. At the top of his nose is a wart, with a tuft of red hair in it, "red as the bristles of a sow's ears." His nostrils are dark and spreading. His mouth is as wide as an oven. This is a description to frighten little boys and girls withal; there is no necessity to add that the miller carried a sword and shield with him. Naturally, he had a white coat, after the manner of millers; and then, for beauty's sake, a blue hood. Besides the usual vice of his trade—the tendency to take excessive toll—he is a noisy gossip and a teller of stories

> Of Moll and Meg, and strange experiences
> Unmeet for ladies.

It is a natural incident of such a character that the man should be noisy; and we are not surprised to find that he carries a bagpipe, with which he blows the pilgrims out of town, just, I suppose, as the old mail coach-guards used to blow their horns as the coaches rolled out at St Martin's-le-Grand in the evening. This last touch completes the strangeness of the picture; the bagpipe being mentioned quite as a matter of course, as if it were a common instrument; which it was in the days of Chaucer, though we are accustomed to think of it as an instrument quite unendurable except on the Scotch hills.'

Contrasted with the miller, drunk and unsteady on his horse, we have the reeve or bailiff. 'Dropping obvious anachronisms, this is pretty much the sort of figure a modern novelist would paint for a house-agent or attorney, or tax-gatherer or excise-man. We have here, upon a gray horse, called Scot (which is said to be invariably the name of a horse in Norfolk), a thin, peppery, close-shaven, close-cut man, with legs that were not only long, but so thin that they were "like a staff; there was no calf seen," says Chaucer. He was a treasure to his lord, whose accounts he had kept under hand since the lord of the manor was twenty years of age. No auditor could bring him in as indebted for arrears; but he drove sharp bargains with other bailiffs and with the herdsmen and others; "they knew his sleight and his covin;" and were afraid of him—"as of the death," says Chaucer. And no doubt in earlier times the power of life and death had been very much in the hands of a reeve who was on terms of favouritism with his lord; for under the feudal system, although the lord of the manor was bound to hold a manorial court, which was usually held in the great hall of the manor-house, upon offenders, yet, of course, the power of condemning a serf to death, *fossa* or *furca* (that is, the gallows for a man, the pond for a woman) was very much in the hands of the lord: the mere fact that any person might in those days be accused of witchcraft must have given immense power to bad people who had ends to gain. We are told that this reeve was a capital farmer, store-keeper, and stock-keeper, and that, like other middlemen, he knew how to enrich himself. He lived in a "full fair" house upon a common, with trees around it (a suggestion of a park evidently), and could even lend to his master; who would reward him occasionally with a new hood and cloak, and condescend to thank him. The reeve had on a long sky-blue coat, and carried a rusty sword; being stingy and more accustomed to use the saw and the hammer than to fight, for Chaucer says he was a good carpenter—which means, for those times, much the same thing as a builder, and implies that he was very useful to his lord in providing or altering the huts of the tenantry.'

The knight, again, presented by Chaucer is a thoroughly 'representative man.' He tells us 'he had ridden far, a chivalric adventurer, defending truth and the ladies, and fighting in his lord's wars—no man further—both in Christendom and in the Holy Land. He had often been served first at the board, because of his nobleness; and his ransom, when he fell into captivity, was high. He was wise (or humble and discreet), and, though brave as a lion, as gentle as a woman. Nor did he make any display in his person or dress. He rode a good horse, but was himself not "gay" to look at. His cassock of fustian was marked by his hauberk, but he had not changed his clothes on returning late from his travels: such was his devotion that he had gone straight on pilgrimage.' Accompanying the knight, and standing next to him in the order of courtesy, stands his son, the squire. 'He has been a good while "in chivachie;" that is, out of his apprenticeship as a knightly man, expecting some time to be himself invested. Being strong and brave, he will soon win his spurs; but at present his prize is "his lady's grace." He is

Digitized by Google

courteous, and, according to the chivalric code, full of ready serviceableness. That he carves the meat for his father is a matter of course; it was the duty of an esquire. He curls his hair egregiously. He is exquisitely got up—"as fresh as the month of May" to look at; and has so many flowers about him, that he is positively embroidered with white and red roses—the flowers of love and knighthood. He is strictly in the fashion of the day, with the short tunic that the clergy so hotly denounced as indelicate. He can joust, of course, and dance well—which latter the clerk cannot do—and he has the clerk's accomplishment besides; for he can write and draw an illuminated letter. He is so eager a votarist of the faith of chivalry, too, that he scarcely sleeps at all; he is up all night (as the nightingale was *supposed* to be) composing or singing love-songs. This young squire appears to have a lady of his own, whose favour he hopes to win; but "so hot he loved" need not, by itself, imply that; for a young man might, by the laws of chivalry, love vaguely: not only a lady whom he had never seen, which was a common thing; but he might simply love . . . . . the universal essence of female beauty and goodness, if he could, as the metaphysicians say, posit it, so as to bring it within the range of an emotion.' This metaphysical sort of love-making is hard to be credited of so material an age—an age exhibiting the Wife of Bath, for instance, as a common type—yet our present author, in chapters much too long for quotation here, does seem to prove that what appears to us an absurdity in the romance literature of that date, was more or less a fact; that beauty and tenderness in women did elicit some mysterious sort of *cultus*, or worship, quite independent of the sexual passion. It is one of the few statements in these volumes in which we find ourselves unable to agree with Mr Matthew Browne.

Even more characteristic of their time than the knight or squire, are the pardoner and the sompnour—the man who had church pardons to sell, and carried relics in his pocket, also for sale. This gentleman was musical; he carried a vernicle, or picture of the head of Christ. In his mall or wallet were 'pardons come from Rome, all hot,' along with a piece of the Virgin's veil, and pigs' bones ('for saints'); yet could fill his place in church, and read and sing the offertory, well. 'The pardoner says that, when he preaches in church, he does it with a loud, commanding voice; for he has learned by rote what he has got to say, so that he has no need to hesitate. His theme is always one, and ever was—namely, that the root of evils is the love of money. "First," says he, "I declare whence I come (namely, from Rome), and I exhibit my bulls, and warn the folks that none of them be so bold as to disturb me in the holy work of Christ. Then I take care to speak a few words in Latin, in order to flavour my discourse, and to stir men to devotion. After this I produce my relics; for instance, a bone that was once part of a sheep belonging to *a holy Jew*, and I inform the rustics that this saint's relic will cure diseases of various kinds in his live-stock, and so forth."' This gentleman goes on to confess that he knows a hundred tricks more, and, among the rest, that his relic kills jealousy; 'a pleasant suggestion, once more,' remarks our author, 'of what ecclesiastical people were accustomed to think of the domestic life of the rude laymen of the period. Do you think, continues the pardoner, that I am going to follow the example of the apostles, and labour with my hands at basket-making, as Paul did at tent-making? No; I will go on begging, and have money, cheese, wool, and wheat, though I squeeze it out of the priest's errand-boy or the poorest widow in the village.' Now Chaucer's realism is admitted on all hands. 'He had no thought of posterity, nor of Protestantism, when he painted this portrait of a popish pardoner; and who can wonder, therefore, that Wickliffe arose in England, and that the echo of his footsteps did not die out till Luther arose in Germany.' The sompnour, or summoner (the ecclesiastical officer whose function it was to summon immoral folks before the archdeacon), is painted in still darker colours. By bribery and base compacts with bad people, this man is always contriving to impound something in the archdeacon's court, and to make money out of it. He thinks morality is for other people; and makes the worst possible use of his power over the young women in his diocese. When he is in his cups, which is often, he is full of law and scraps of Latin.

The friar comes off but little better than his two church confrères; one friar is described as begging, while another writes down on his tablets the name of any person who gives, assuring him that he would be 'prayed' for accordingly.

> Gif us a busshel whet, or malt, or reye,
> A Goddes kichil [*cake*], or a trip of chese,
> Or elles what yow list, we may not chese;
> A Goddes halpeny, or a masse peny;
> Or gif us of youre braune, if ye have eny,
> A dagoun [*piece*] of your blanket, leeve dame,
> Oure suster deer—lo! her I write your name—
> Bacoun or beef, or such thing as we fynde.

All is fish that comes to their net. They are not particular, as, indeed, how should pious friars be. 'A capon's liver, with a slice of soft bread, and a roasted pig's head, are all I want—indeed, I would not that you should serve up your best for such as *me*. I live chiefly on Holy Writ.'

Well may our author remark, that between monks, friars, clerks, and summoners, it is pretty clear, even after the humourist's licence has been handsomely allowed for, life in Chaucer's England must have been honeycombed with ecclesiastical meddling. It is true that the company were not without their good priest—the poor parson—the poor halfpennyworth of bread to all this sack. And it is a beautiful portrait—

> Such as the heaven-taught skill of Herbert drew,
> And tender Goldsmith crowned with deathless praise.

This excellent minister of God would rather forgive his tithes to his poor parishioners than press for them, and being satisfied with but little, he was, though poor, able to help others. His parish was a large one, the houses being far apart, but bad weather never prevented him visiting his afflicted people, high and low, up to the very boundaries of his cure, and he used to walk all the way. He *did* first and preached afterwards, so that he gave his sheep a 'noble ensample.' If gold itself rust, what can we expect of iron? If a priest lead a foul life, what can be looked for from secular people? He did not set his benefice for hire, or leave his flock to itself while he went to London to seek preferment. Nor,

Digitized by Google

though so virtuous, was he untender and repelling to sinners.

There are good priests now, and let us hope that bad ones are (not, as in Chaucer's time) the exception, and not the rule; and we have also country-gentlemen, or rather what we now call gentlemen-farmers, as hospitable and wholesome as Chaucer's Franklin, whose face is ruddy from the country air, and beard white as a daisy; and who, if not believing in St Julian, the patron saint of hospitality, still keep open house—a house wherein it snows meat and drink. Let us now leave the male characters of the jovial procession and suite, and glance at the female ones.

SUBMARINE TREASURE VENTURES.

England, Holland, France, and Spain were much addicted to declaring war in the seventeenth and eighteenth centuries; and whenever this was the case, the enemies of Spain looked out sharply for the treasure-ships returning to Europe from the gold and silver mining regions of the Indies—the Spanish galleons. These galleons were very large ships, with three or four decks. Spain used to send them at fixed periods to the coasts of Mexico and Peru, to receive on board the gold and silver bullion extracted from the mines, and bring it to Spain. Commodore Anson, as is well known, was one of the lucky naval commanders who fell in with and captured one of these auriferous galleons. But the most notable instance was that at Vigo Bay, a few months before Queen Anne ascended the English throne. At that time, England and Holland were at war with Spain and France, in a struggle called the War of the Succession, relating as it did to the right of succession to the Spanish throne. Of course, being a war by land as well as by sea, all was fish that came into the net; and as it so happened that a fleet of Spanish war-ships was at that very time convoying a fleet of Spanish treasure-ships across the Atlantic, it was natural that the English and Dutch should look out for something in that way. Vigo was the place—a bay near the extreme northern end of the Atlantic seaboard of the peninsula, and separated from Cadiz by the whole length of Portugal.

What says Macaulay concerning this transaction? 'The fleet was off the coast of Portugal, on the way back to England, when the Duke of Ormond received intelligence that the treasure-ships from America had just arrived in Europe, and had, in order to avoid his armament, repaired to the harbour of Vigo. The cargo consisted, it was said, of more than three millions sterling in gold and silver, besides much valuable merchandise. The prospect of plunder reconciled all disputes; Dutch and English, admirals and generals, were equally eager for action. The Spaniards might, with the greatest ease, have secured the treasure by simply landing it; but it was a fundamental law of Spanish trade that the galleons should unload at Cadiz, and at Cadiz only. The Chamber of Commerce at Cadiz, in the true spirit of monopoly, refused even at this conjuncture to bate one jot of its privilege. The matter was referred to the Council of the Indies. That body deliberated and hesitated just a day too long. Some feeble preparations for defence were made. Two ruined towers at the mouth of the Bay of Vigo were garrisoned by a few ill-armed and untrained rustics; a boom was thrown across the entrance of the basin; and a few French ships of war, which had convoyed the galleons from America, were moored within. But all was to no purpose. The English ships broke the boom. Ormond and his soldiers scaled the forts; the French burned their ships, and escaped to the shore. The conquerors shared some millions of dollars; some millions more were sunk. When all the galleons had been captured or destroyed, came an order in due form allowing them to unload.' Admiral Rooke was with the Duke of Ormond, the one having a fleet of fifty sail, and the other a land-force of thirteen thousand men. Accounts are very conflicting concerning the ratio of treasure secured by the Spaniards, brought away by the English, and sunk. One writer states that the English brought away several men-of-war, and six galleons containing treasure to the amount of seven million pieces of eight; while the Spaniards sank eleven or twelve galleons laden to the value of six millions in gold and silver. Another, that the treasure sunk was more in value than that which was saved by the Spaniards, plus that which was brought away by the English. Another, that the total treasure was twenty million pieces of eight, of which no less than fourteen millions was captured by the English. Therefore, Macaulay's 'some millions of dollars' brought away must satisfy our curiosity as best it can. The English spoil was in great part embezzled by nefarious agents, but some reached England, and was coined, as a memento of the achievement.

What the pieces of money really were, is a matter that seems to be left in some confusion. Some speak of them as gold, some as silver, some as gold and silver; while others would treat the treasure as bullion in gold and silver, worth so many millions sterling. The designation 'pieces of eight' has had different meanings at different times—a gold doubloon of eight double crowns, and a silver crown of eight *ochavos*. Nay, it has sometimes meant a *value*, and sometimes a *weight* of silver; for the silver piece of eight had the weight which was at one time called eight royals. All things considered, we may perhaps better take the more modest estimate—that a treasure worth so many pieces of eight was about equal to so many of our crown pieces, or an ounce of silver each.

Now, there is a project on foot to send out an expedition, with the avowed purpose of recovering the sunken treasure, if possible. A *concessionaire* has had this matter in view for ten years past. He obtained from the Spanish government a concession (as it is called on the continent) or permission to do this; the agreement being, that whatever is raised from the sea-bottom of Vigo Bay, be it little or much, is to be shared in the ratio of three-fourths to him, and one-fourth to the Spanish crown, he to bear all the costs and trouble of the enterprise.

When Colonel Gowen, in the early part of the present year, examined the actual condition of the sunken ships, he found the following results: 1. The *Almirante*, in seven and a half fathoms water, has her timbers projecting two or three feet above the mud and shells at the bottom of the sea, all else being couched in a slimy bed; there are no indications that she has been burned, and the

Digitized by Google

timbers below the mud have escaped from the attacks of the *teredo*. Although called a man-of-war, she more resembles a galleon. 2. The *Espicio* is in eight fathoms water, with her timbers nearly whole, but much perforated by the teredo. 3. The *Tambor* is more sound and perfect than the two above named, the deck being eighteen inches under the mud and shells. Colonel Gowen detected a layer of brickwork on a part of the deck; this he supposes to have been the floor of a cook-house. The deck is made of planks six inches wide by five in thickness. 4. The *Crusata* is in eight and a half fathoms water, sounder and less encumbered with mud than any of the three above named; on the ship lie an anchor, a mortar, and a gun-wheel. 5. The *Chaternan* has been burned to some extent, but her timbers appear to be quite sound. 6. The *Higuera*, lying in five and a half fathoms water, has been much burned, but her timbers are generally sound: several cannon-balls are on the deck. 7 and 8. The two remaining vessels, whose names are not given, have been much burned, and are immersed eight or ten feet in the soft mud.

The original names of the ships are not mentioned; those here given have been adopted by the divers who from time to time have examined them. All the sunken vessels form so many separate and complete mounds, above the general level of the bed of the bay, so great has been the accumulation of shells and mud above and around them. The galleon said to be the richest of the whole fleet, while being towed out of the bay by the English ship *Monmouth*, struck on a sunken rock in the South Channel, and went down. All hands were saved except two, but the treasure went to the bottom, and—like the old woman in the vinegar bottle—'if not gone, lives there still.'

The concessionaire has formed, or is endeavouring to form, a Company, with a joint-stock purse sufficient to defray the costs of the venture. Regarded as a speculative investment, as a source of profit, we have nothing to do with the matter here; but as a proposal for rendering useful that which is now useless (supposing there is really any treasure there after all), there are certainly points of interest about it. Colonel Gowen, for reasons presently to be stated, has been engaged to practically conduct the operations.

As to the means of raising the treasure, the armour-encased diver is looked forward to as the man of the future. Colonel Gowen says that he can only learn of one attempt having been made to raise the treasure, about twenty years ago. It was made upon two of the vessels only, by the aid of the diving-bell. This, as is now pretty well ascertained, is not an effective practical mode of procedure, seeing that the divers can make only a superficial examination, not beyond the lateral extent of the iron walls of the bell itself, and cannot possibly descend into the holds of sunken ships, or into any irregular cavities. The diving-dress—which leaves the arms and legs of the wearer free, while protecting his head from all access to water, and providing fresh air for respiration, and an exit for respired air—allows him to walk and scramble about into all sorts of holes and corners, always provided he does not break or entangle the ropes and pipes which connect him with the world above.

The exact plan which Colonel Gowen determines to follow will probably depend on the special circumstances of each ship. It is now known from practical experience that vessels can be, and have been, raised bodily from the bottom of the sea; while it is equally well known that divers can extricate and bring up valuable property from sunken ships. Floating pontoons have been used in a variety of ways for the first mentioned of these purposes. A remarkable instance of this kind took place last year. The *Wolf*, an iron-built mail-steamer, was sunk by a collision in Belfast Lough, and lay submerged in forty feet depth of water. After considering many plans of proceeding, Messrs Harland and Wolff undertook to raise the vessel. They constructed an immense floating raft of iron air-tanks, thoroughly water-tight. There were four of these tanks, arranged in two pairs, with a lateral distance between the pairs more than equal to the extreme width of the sunken vessel. Stout cross logs of timber in various parts connected the whole of the tanks into one float or raft, having a buoyant power of eight hundred and fifty tons—more than equal to the weight of the submerged ship. The vessel being embedded in eight feet of mud, there was no facility for passing chains under and around the hull, as has been done in other cases of ship-raising. Instead of this, chains were hooked into the side-light holes in the hull; there were fifty of these holes, fifty chains hooked into them, and fifty capstans or lifting-screws on the platforms of the float, to lay hold of the upper ends of the chains; each chain being capable of lifting twenty-five tons. Divers were employed to examine the exact position of the ship, and to secure the hooks into the side-light holes. These elaborate preparations being ready, the process of raising began. Two hundred and fifty men were set to work at the capstans or screws; they worked with a will; and in six hours the half-drowned *Wolf* fairly made an appearance above the surface of the water, and was towed triumphantly into Belfast harbour.

Whether Colonel Gowen proposes to adopt some such plan as this at Vigo, is not yet stated. Perhaps he holds himself open to vary his plan according to the circumstances which each vessel may present on examination; and perhaps he may try to bring up the treasure without raising the ships themselves. Certain it is that he *has* raised sunken ships; and it is on this account that his services have been secured for the Vigo enterprise. Those who are conversant with the details of the Crimean War will remember that on the 23d of September 1854, three days after the battle of the Alma, and three days before the arrival of the British army on the heights above Balaklava, Prince Menchikoff adopted the bold expedient of forming a line of Russian ships-of-war across the entrance to Sebastopol harbour, and sinking them by scuttling. It was apparently a reckless and unprecedented bit of strategy, but it fully answered the intended purpose; for the magnificent English and French fleets were unable throughout the war to make the smallest entry into the harbour, or to approach near enough for any effective bombardment of the fortifications. Again, on the 8th of September 1855, when the Russians abandoned Sebastopol, and retreated to the northern forts, they sank all the remaining ships in the harbour, to prevent them from falling into the hands of the besiegers. Thus it arose that the fine harbour of Sebastopol

Digitized by Google

was choked up with sunken ships. Well, it is in this quarter that Colonel Gowen has already displayed his ship-raising ingenuity. He says: 'When raising the sunken fleet at Sebastopol for the imperial Russian government, I laboured under a number of difficulties which can scarcely be over-rated; and yet the most perfect success attended my operations, as I then raised and cleared seventy vessels of all sizes, some of which are now in commission.' Comparing Vigo with Sebastopol, he adds: 'My soundings in the Bay of Vigo shewed a bottom of mud in which the galleons are not more than half buried. When I compare this with the twenty feet of mud, clay, oyster-shells, and gravel in which the sunken fleet at Sebastopol was lying, I look forward with the most sanguine expectations to the result of the proposed undertaking. Instead of an open roadstead, as at Sebastopol, the small bay in which the galleons are lying is completely landlocked, so that operations can be carried on in all weathers, and through any season of the year.'

We shall see, therefore, whether Neptune can be made to yield up the treasure which, according to repute, he has for a hundred and sixty-seven years retained in his dominions at the bottom of the sea.

Another submarine Venture also invites our attention at present; but the lost treasure is of much smaller amount, and the episode has something like a century less of time to give romance to it. The facts are briefly as follow. In 1799, when Holland was waging war against France, and England aided the Dutch government with subsidies of men and money, a large amount of treasure was sent over in Her Majesty's ship *Lutine*. The government bullion or cash alone is said to have been a million and a half sterling in value; in addition, there were the crown-jewels of the Prince of Orange, which had just been repaired by Messrs Rundell and Bridge; while bullion sent over by private firms, and a large cargo of merchandise, raised the total value of the ship and its contents to a vast sum. Indeed, some accounts gave this total at three millions sterling. The *Lutine* was bound to the Zuyder Zee; but a storm raged so furiously on the coast of Holland, that she was driven on a sandbank between the islands of Vieland and Terschelling, and there wrecked. The circumstances were so unfavourable to anything in the way of rescue, that almost all the crew of two hundred persons were drowned. There was the treasure, then; and what became of it? During the first two years after the wreck, no attempt at salvage seems to have been made; but, at a later date, an English Company was formed, to endeavour to recover the sunken treasure, under an agreement that the Dutch government should receive one-half the proceeds. In the course of a few years, a sum of one hundred and sixty thousand pounds was raised, by such modes as were then known of employing the diving-bell, and divided equally between the Company and the government—that is, the Dutch government, for it does not appear that the English government put in a claim to it. The English underwriters or marine insurance firms lost heavily by the wreck; but the Dutch government for many years refused to recognise their claim to any of the salvage. More recently, however, Lloyd's, as the representative of the English underwriters generally, obtained twenty thousand pounds out of some of the treasure fished up; this sum has been invested at compound interest, and is to serve as the basis for a new adventure. Another attempt is to be made, under the management of the committee of Lloyd's, and probably under agreement also with the Dutch government, to raise some or all of the buried treasure. We believe the attempt is to be made next summer, and probably with the effective diving-dress, instead of the diving-bell. The public are *not* invited to subscribe to this new adventure; so we have simply to take up the position of lookers-on, and wish success to the operators on the drowned *Lutine*.

CHAMPAGNE.

Faster, faster, friend of mine!
Pour it not like vulgar wine;
'Tis a monarch—treat it so.
Let it frothing, foaming, flow
To the brim, o'er the brim—
Let the king his glories shew!

See it swell, and hiss, and froth
Like a maelstrom mad with wroth,
Roaring, raging, everywhere!
See uprise those tiny bubbles.
So our troubles, all our troubles,
Thus shall melt away in air.

Like a lion in its den
Startled by the tread of men,
Forth it foaming, flashing flies;
And each bubble, ere it dies,
Sparkles, sparkles, sparkles, sparkles,
Sparkles like a woman's eyes.

Ah! 'tis still! Its rage is spent
From mere want of aliment;
And its breath of life seems fled:
Fling the hungry wretch some bread.
Bread from thee! take bread from thee!
Sooner were the monarch dead.

Up he springs, and swells his tides
As to burst the glass' sides.
Bread to him who wears a crown!
Bread, the food of every clown!
Now, my friend, the bottle end;
Quaff the foaming monarch down.

The Publishers of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the 'Editor, 47 Paternoster Row, London.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MSS. should be written on one side of the leaf only.

Unless Contributors comply with the above rules, the Editor cannot undertake to return rejected papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH. Also sold by all Booksellers.

NOBODY'S LUGGAGE.

THE scene is a huge dock warehouse on England's great highway to the East and the West, where, coming in from the bustle and the sunshine, and the fresh air of the docks, one is impressed with a strange stillness and gloom. The air is fluffy with very old dust, and the big motes, floating in sunbeams that fall through heavily grated windows, move sluggishly and gravely. The place is hushed and tomb-like. No busy porters nor self-important custom-house officials are here, yet the place is heaped and piled and strewn with luggage—Nobody's luggage—in value many thousands of pounds' worth. Why don't the owners fetch it away? Nobody knows, and nobody cares, and as it belongs to Nobody, Nobody knows best. Much of this unclaimed luggage has been here five years and more; still, nobody asks for it, save in rare instances, and then Nobody often refuses to redeem it by paying the warehouse charges which have accumulated on Nobody's goods. These goods have either been wrongly addressed, or not addressed at all; or improperly advised, or not advised at all; or the consignee is dead or bankrupt, or won't pay the dock dues on them; and here they are in bond and keeping for six years' imprisonment. The dock authorities have power to sell goods unclaimed after two years to reimburse themselves, but it answers their purpose better to let Nobody's luggage 'eat its head off' in charges, as they put it; so that if Nobody should ever turn up after the goods are sold, he may get nothing. With this view, the unclaimed luggage is examined from time to time, and ticketed with the charges incurred for storing to date. Those packages are then selected on which the dock company's lien for dues being considered equal to the value of the goods, their heads may be supposed to be eaten off, and they are offered for sale by auction.

A strange assortment is Nobody's Luggage. One would have expected among so much unclaimed property to have found at least one or two prodigal umbrellas yearning to be restored to the arms of their long-lost and rightful guardians. But no—not even a stick of one. Where do they all go to—stray umbrellas? They do not enter here—'Nobody' hasn't got them.

What did Nobody intend to do with that five hundredweight of caoutchouc? (the dock-porter calls it 'ka-chook' for short—don't laugh at his ignorance—Knowles and Smart, the auctioneers, call it 'kô-chûk'); and why don't he take it away, and rub out the score?

Nobody sent twenty serons of Syrian tea without address or bill of lading. There it is in the great skin-packages in the warehouse. Nobody's tea has been waiting for him for six years: will the man never come to his tea, or has he gone for good to his bier?

There is indigo in maunds of buffalo-hide, a ton of it, that has been here seven years, and may stop here 'till all is blue' before it will get claimed.

Will Nobody ever come to fetch the ivory tusks, near a dozen of them, in canvas packages, which were sent to his order from the Brazils 'a long time ago?' Or, if he has not remitted payment for them, and is short of funds, why does Nobody not come and claim the *box of gold-dust*, marked and numbered—— But, no; this is a dock secret. Aha, Mr Nobody! you prick your ears. Untold riches which nobody knows await you here, and—the best and the worst of it is—Nobody can claim them. However, it will be long before the box of gold-dust 'eats its head off' in charges; so, set your wits to work.

At the time of the dearth in the cotton-supply, when many thoughtful minds turned their attention to seeking a substitute for cotton, a scientific man brought home from the West Indies an immense quantity of queer-looking roots. They are very fibrous, and fray out into strands stronger than flax, and as soft and shining as silk itself. But when he came back, the war was over in America, and the cotton-supply promised better, so he relinquished his project, and left his roots in 'pound' for the dock dues. There they remain to this day.

At the far end of the warehouse is an immense pile of chairs—Nobody's chairs. Hundreds, almost

Digitized by Google

thousands of them. These are 'deck-chairs,' which the home-passengers by the Peninsular and Oriental steamboats bought for the passage home, and have preferred to be relieved from, rather than pay the sixpence dock dues on something so awkward to carry about as a deck-chair. They are of all shapes and sizes and sorts—American, French, and Indian—bamboo, birch, rattan, wire, and cane. They will accumulate, and no matter how often the storehouse is cleared of them, there is always a pile.

Here are sea-chests too, belonging to seamen—sent to the docks to be left—for seamen who never come. The chests wait in the baggage warehouse till all hope is gone, and when the time for hope has passed without inquiries, they come up here—dead men's chests—chests of orphan, homeless sailor men and boys, with the London and Foreign Bible Society's Bible in them, and no one to inquire even for *that*—till the Judgment Day.

At the last sale of Nobody's unclaimed luggage, among other stray strange things that were put up for sale was a band-box containing—guess?—a wedding bonnet! There it had staid in the musty old warehouse for nearly seven years. The label had been washed off, and there was no direction, and no clue to sender or destination; so it became Nobody's luggage. Every box is opened by the authorities before going into the unclaimed warehouse, and an inventory carefully taken of its contents. One item in this band-box, however, escaped the scrutiny of the examiner. The bonnet was taken out and displayed by the auctioneer—white silk and white *tulle* and white lilies it had been once. Now, it was all soiled and yellow—a poor sad, drabbled thing, limp and of a fashion long gone by. A labouring man bid two shillings for it, and got it, and was jeered at for buying it. But on taking it home he found sewed up in the bonnet's crown a sovereign, and these words on the bit of paper that wrapped it up: 'A wedding present to my dear Allie.' Nothing else.

And that was Nobody's bonnet. Who was 'Allie?' And had she expected the present, seven years before? Were there tears that it did not come? or would there have been more if it had? And was she married to Nobody after all? And now? Is she Nobody's bride?

A COUNTY FAMILY.

CHAPTER IV.—THE LETTER FROM DERBYSHIRE.

When Mrs Blackburn got within doors, she found Ellen with her elbows on the window-sill, staring through the diamond panes, as though a beloved object could be beheld by refraction, even though it had passed the range of the horizon.

'It is a good wind that blows nobody ill,' thought her grandmother: 'Mr John Denton is like to lose his mistress if Anthony gets his own.—Ellen,' said she, laying her hand upon the young girl's head, who started and blushed at her touch, 'there 's a letter come for grandfather.'

'Indeed, grandmother: what a pity that John has gone!'

The old woman smiled.

'I mean,' stammered Ellen, blushing again, 'because he could have taken grandfather his letter.'

'That may have been as though a schoolboy should carry the cane with which he is to be beaten to the master's hands,' observed Mrs Blackburn gravely.

'I do not understand you, grandmother,' said Ellen with wondering eyes.

'No, child; and perhaps there may be no need that you ever should. But listen—if, at least, you can hear anything but that handsome young fellow's last words, which are ringing in your ears like marriage-bells, I know.'

'What is it, grandmother? How strange you look! how your eyes glisten! Are you well?'

'Am I well?' repeated the old woman passionately. 'What a life I must have led these many years, if, when one seed of hope springs up in my withered heart, and makes my face to shine, folks think I have the fever!—Yes, I am well, child, and very well; that is, if *this* be well;' and she placed the letter just received in the girl's hand. 'Do you not recognise the handwriting?'

Ellen shook her head.

'What! do so many letters, then, come to Moor Cottage,' continued Mrs Blackburn excitedly, 'that you cannot tell one from the other? To be sure, I forgot that John Denton writes whenever he cannot come to see your pretty face. But I tell you there may be something in this letter worth fifty of your John Dentons, with his house of eight rooms, and his two hundred pounds a year to boot.'

'Worth fifty John Dentons!' ejaculated the young girl, with the air of one who says 'fifty millions,' and endeavours in vain to picture to herself so fabulous a sum.

'Yes, child,' pursued the old woman; 'and if you were not crazed with love, you would know what I mean at once. This letter is from the family lawyer—the Redcombe lawyer—the same who wrote to us, only a year ago, to say that Richard Blackburn was dead; and this, you see, has a black border and a black seal, as that had.'

'Do you think that poor young gentleman—his son—is dead then also?'

'I *hope* he is, child.—Poor young gentleman! He was never poor; he never knew what it was to fare hardly, and work for pence, while youth and health were stealing away. *Poor*, indeed! he that was rolling in ill-gotten wealth, while your grandfather and I were *here!*' and she looked round with scorn at the bare walls of the cottage.

'That was not his fault, grandmother,' pleaded Ellen gently, 'for you know that his first act, when his father died, was to offer to assist us.'

'Yes, to assist us out of our own money; that was a fine thing to do, indeed!' The speaker delivered herself of this last remark with the greater bitterness, because she herself, on the principle of half a loaf being better than no bread, had been for accepting the young gentleman's proffered aid, a suggestion to which old Anthony would not listen. Her grand-daughter, though well aware of this circumstance, was not so imprudent as to recall it to her; she contented herself with quietly saying: 'But how do you know what is in the letter, grandmother?'

'How do I know! Why, for what else can it be, except to say that the lad 's dead, that Mr Moffat writes? He promised your grandfather to do so, you know, whenever anything of importance occurred in the family.'

'But why should he not write, then, to tell us that young Mr Richard was engaged to be married, which John himself heard to-day on Slogan?'

Digitized by Google

'I never thought of that,' said the old woman, falling into rather than sitting down upon a chair. 'Alack, this is worse than all! To be so buoyed up as I was, and now to be sunk deeper than ever!' Her voice, so jubilant, and even fierce, had at once returned to its old hoarse and hopeless tone; the gleam of her eyes was quenched; she looked ten years older than she had done a minute before, as the tears rolled down her furrowed cheeks without a sob.—'But why should the letter be in mourning?' observed she eagerly after a little silence.

'Well, grandmother, Mr Moffat himself may be in mourning, for all we know.'

'Ay, that's true,' remarked the old woman sadly. 'Everybody dies but them as ought to die.'

'Would you please to give me that sixpence?' observed a shrill voice at the cottage door. 'I promised to be back at the stable at four o'clock, 'cause some ladies and children has hired donkeys, and I 'm the donkey-boy.'

'It 's the lad who brought the letter,' explained Mrs Blackburn. 'I promised him twopence extra, because I thought it was sure to be good news; and now I wish he had never come with it at all.'

'Come, none of that reading first, and then not paying,' began this irrepressible youth; when, suddenly catching sight of the young girl, his countenance fell, and he added in tones that were meant to be respectful: 'I beg your parding, Miss Ellen; I did not know as you were at home.'

'That is no reason why you should be impudent, Jemmy,' observed Ellen. 'My teaching at school does not seem to have done you much good, I fear, since you are so rude.'

'O yes, miss, it did, leastways so long as you was doin' on it. But we ain't got no such teacher now; and besides, now I 'm a donkey-boy, I don't go to school at all.'

'Send him away, send him away!' cried Mrs Blackburn querulously. 'I have twopence here, and the other fourpence must be taken out of your father's box yonder, which holds grandfather's 'bacco-money.'

'There is only threepence in the box, grandmother.'

'Alack! nor more there is. I forgot it was the end of the week.—Look here, lad; here is fifpence for thee; and instead of the other penny, I will cut some bread and cheese, and give thee a draught of milk.—Dear, dear,' muttered the old woman, 'to part with money and good food, just to hear bad news that has been already told us!'

The boy had been fed and dismissed, and the afternoon was drawing on, but still Mrs Blackburn sat in the rush-bottomed chair, her generally so active arms quite still, and folded before her, and her eyes fixed on the letter, which had been placed on the mantel-shelf. Ellen sat by the window working nimbly with needle and thread, but without venturing to interrupt the silence.

At last, she rose, with a quiet 'Here is grandfather home already;' and she went out on to the moor, as was her custom, to welcome the old man.

He received her, as he always did, with a loving kiss; but she strove in vain to discover, from his looks and manner, whether John Denton had spoken with him or not upon the matter which lay next her heart. Anthony's face was haggard, and his step more slow, she thought, than it was wont to be; but this could be easily accounted for if he had heard the news of Richard Blackburn's engagement. On the other hand, she knew enough of her grandfather not to expect to find him elated, as his wife had been, by the young overlooker's improved prospects, even though John should have proposed for her.

In the first place, the old man thought his Ellen a prize for any man; and in the second, he still clung with a tenacity that neither years nor disappointment could weaken, to the idea that he should one day enjoy his own again, as the Squire of Blackburn Manor. It would have been ludicrous, were it not so mournful, to contrast with so grand an expectation the toilsome appearance, the mean attire, and even the usual topics of talk of him that held it. Whatever colour his dreams might wear, his waking thoughts were clad in drab, concerned themselves only with the practical realities of life, unless, as by the stranger that day on Slogan, that chord chanced to be struck which always vibrated too powerfully for Anthony's self-command.

Had the pane been mended, was his first question, which Thomas the glazier had promised to step up and see about, in the window of the bedroom; and when he heard that it was not, his brow grew cloudier than before. The winter would come upon them, he foresaw, with that job still undone, and he should have again that rheumatism in his joints, which had crippled him so last spring.

'I trust not, grandfather,' said the young girl affectionately; 'and as for the window, if that remains as it is, and since *I* am not subject to rheumatism, grandmother and you shall have my room.'

'To which we shall be all the more welcome,' remarked the old man grimly, 'because you hope to be elsewhere—eh, you jade?—where the panes of glass are sound.'

'Indeed, grandfather'——

'There, there; don't tell stories, girl,' interrupted Anthony pettishly. 'I know all about it; Denton has been talking to me for an hour and more. I daresay he thinks it 's a mighty generous thing to offer to marry a quarryman's daughter, he being the master of us all; but I can tell him—and indeed I did tell him—that Anthony Blackburn's grand-daughter has as good blood in her veins—from one side, at least—as any girl in England, and may one day yet hold up her head with the highest. Two hundred a year, indeed! Why, unless young Richard has kicked it down—which is not very likely, since he is still a minor—there is four thousand a year in land about the Manor; and the Mosedale property, Mr Moffat tells me, is worth ten times what it was, now that the town has sprung up.'

'There is a letter come for you from Mr Moffat, grandfather,' said Ellen quietly, to whom the opportunity for thus interrupting the old man's recital of his possible greatness was welcome enough.

'I expected there would be,' returned he coldly; 'and my expectations, when at least misfortunes are anticipated, are generally realised. John Denton took care to tell me that young Richard is engaged to be married; but there 's many a slip between the cup and the lip, and instead of the marriage-bed, the grave sometimes receives'——

'Nay, grandfather, do not talk like that; I am sure you do not mean it. You are too kind, too good'——

Digitized by Google

'Do I not, grand-daughter?' And the old man stood still, while over his bearded face there stole a terrible look. 'I tell you, that if by raising my finger—thus—I could save that young man's life'——

'Yes; but you would not take it! Oh, say you would not take it, grandfather?' pleaded the young girl passionately. 'The seal of the letter is black, and there is black on the border of the envelope, and for all we know, we may be talking of one whom death has already taken.'

'Black on the border!' cried the old man, his eyes lighting with sudden fire, and his limbs moving with hasty strides towards the cottage. 'Where is the letter?—Where is it, wife, I say?'

'It is on the mantel-shelf next to your 'bacco-box, Anthony; and we took out your last three pennies, besides two of my own, to pay the lad as brought it, and until Saturday, we have not a farthing in the house. Yet it brings nought but bad news, Ellen tells me'——

'It brings the best of news,' exclaimed the old man excitedly. 'I say it must bring it.—Get me a chair, Nelly, for I feel my head go round; there is something dancing before my eyes, and I cannot make out a word. Read it aloud, child. But no; I can't bear that: let us know the news at once in a single word.'

'Mr Richard Blackburn is dead,' said Ellen in a solemn voice.

'Then justice is done at last,' ejaculated Anthony, clasping his hands. 'At last, after fifty years!'

'And there is money in the letter—notes!' exclaimed Mrs Blackburn, snatching both them and it from her grand-daughter's hand. 'There is fifty pounds, in case we may have present need of money, he writes, and to defray expenses on our journey home.'

'Home!' repeated the old man. 'Home at last!' Then his lips moved without a sound.

'It was appleplexy, and quite sudden,' observed Mrs Blackburn, looking up from the letter. 'You know we were once told that he had a short neck. How I wish that we had got this money in golden pounds; it don't look half so much in paper!—does it?'

The sight of such an unaccustomed sum within her very palm, prevented all speculation on the future; the letter itself, with its contents, was disregarded in comparison with such a present gain.

'What a terrible blow for the young girl who was engaged to be married to poor Mr Richard!' exclaimed Ellen sorrowfully, her genuine regret doubtless increased by the position in which she herself stood with respect to the young overlooker.

'My darling Nelly,' said the old man softly, 'let me kiss you! You are a good girl, and Heaven has rewarded you for it: that charming face of yours has now the fortune which always seemed by rights to belong to it. Within six months, you will be the belle of the county. I wish you joy, my dear, with all my heart.'

'Thank you, grandfather,' replied Ellen timidly. 'I hope that you and grandmother will find all the happiness from this change of position which you anticipate;' and with that she glided from the room into her own bedchamber.

'I am afraid she will hanker after that John Denton still,' said the old man slowly; 'and though, of course, he is not to be thought of now, it is lucky I did not give him a definite promise.'

'It is not that, Anthony, which makes Nelly sad,' said Mrs Blackburn earnestly; 'it is the thought that we are such a divided family: you don't know how she frets about that. Surely, now that you have got your own again, you will forgive and forget.'

'I cannot forget, woman,' returned he gloomily; 'the remembrance of which you speak forces itself upon me now with tenfold bitterness. But I will endeavour to forgive.'

An hour ago, one would have said that such news as they had just received must needs have made every member of the little household happy. Yet Anthony Blackburn, unable to dismiss from his mind the recollection which his wife had just evoked, took his way towards the little seaside town with no very radiant looks; and Ellen, filled with sad forebodings, lay on her little bed with her face to the wall, too sad to shed a tear.

Mrs Blackburn alone seemed to feel these sudden rays of the sunshine of prosperity strike to her very core. 'She could sit down to nothing,' as she expressed it, from sheer delirious joy, but moved briskly about the cottage, again and again stopping to smooth out the two bank-notes which her husband had left with her (he had gone to get change for the rest), and to murmur to herself that her Willy was coming home, for good, to be a gentleman.

CHAPTER V.—COMING HOME.

It is not many days since that eventful letter arrived, for which Mrs Blackburn had disbursed all the money in the family coffers; yet the cottage on the moor is tenantless; and a carriage-and-four is conveying its three inmates to the home that is so old to two of them, and so new to the third, as fast as the steepness of the Derbyshire hills will permit. The railway has brought them no nearer than within twelve miles of the Manor; and to Mrs Blackburn, eagerly desirous of beholding the great house of which she is at last the mistress, this distance appears interminable. Prosperity, if it has already taught her impatience, has, however, worked wonders for her externally; her attire, by no means sombre in its tints—for Anthony has peremptorily forbidden the least pretence of mourning for his deceased nephew, and she is far from wishing to be disobedient in this respect—becomes her well; the splendour, at which she herself would fain have aimed, has been judiciously mitigated by her grand-daughter's good taste, but enough remains for striking effect. The best remedy for her impatience seems to consist in regarding closely the texture of her costly mantle, or stroking the unaccustomed gloves that conceal her red rough hands. Beside her sits her husband, his eyes restlessly roving from object to object on the road, which, with every revolution of the wheels, seems to grow more and more familiar to him; still, every now and then, his recollection is evidently at fault; and this seems to pain him. He will then stand up and put a question or two to the nearest postboy, albeit he generally receives little satisfaction from that source. The postboy has not a map of the district around Blackburn Manor, fifty years old, before *his* mind's eye, so as to be able to appreciate minute changes, although he can indicate important ones. Thus, after having reached the top of a long winding hill, from which a vast extent of

Digitized by Google

country could be seen, 'What's *that*?' cried Anthony eagerly, pointing to where from some far distant valley rose the smoke of a thousand fires.

'Why, Mosedale, sir,' answered the man, turning round in his saddle with great astonishment, while the panting horses rested for a minute. 'There's twenty thousand folks and more lives down yonder now, sir.'

'Ah, to be sure, I had forgotten,' returned Anthony with the colour in his ancient cheeks. 'But that high mound yonder to the left is surely new?' He pointed to the verge of the far-stretching purple moor, where something resembling earth-works seemed to have been recently thrown up.

'That is the new reservoir, sir, for supplying the town with water. They do say it cost fifty thousand pounds.'

Anthony nodded gravely, and his bearded face grew sad. The last time he had stood upon that moor—gun in hand, and full of strength and youth—not only was there no such mound to be seen, but no cloud of smoke hung over yonder valley. He felt like Rip Van Winkle after his long sleep; and, indeed, his condition was even worse, for not only were his people changed beyond recognition, and mostly by death itself, but the places in which they had dwelt had altered also. He felt somehow ashamed of his ignorance, and put his next question with a faltering voice, and in a form that admitted of retreat: 'That is not Curlew Hall with the tall turret, is it?'

'Yes, indeed, it is, sir; though I daresay the new wing, built by the late Squire, makes it look strange; and yet that must have been done these ten years. They do say he crippled hisself with the expense; but young Mr Herbert would have run through the money anyhow, so it's just as well spent in bricks and mortar.'

The carriage moved rapidly on, and the observations of the communicative postboy were thereby cut short; but they awoke a train of reflection in the old man, who lay back as if fatigued, regarding with half-shut eyes the pale features of his beautiful grand-daughter who sat opposite to him.

'That is the young Herbert Stanhope,' ran his thoughts, 'whom I saw on Slogan the other day, and whose grandfather was once my bosom-friend. He has a good heart, I think, even if he be a spendthrift, since he offered an old quarryman a drink from his flask. Perhaps it was for the sake of Nelly's pretty face; but if so, so much the better. The Curlew and Blackburn estates join at the Longacre. His family is the oldest in the county, except our own; and if he is in want of money, there will be less of scruple.'

Some unpleasant thought had here arisen in the old man's brain, for he sighed heavily, and once more raised himself and looked around, as though to avoid dwelling upon it.

'We surely ought to see Redcombe from here, man, ought we not?' inquired he. 'One used to catch the church-tower from all points of the moor, I thought.'

'Ay, sir, but that was before the woods growed,' bawled the postboy. 'You don't see neither church nor manor now till you comes close upon 'em.'

Even the very face of nature, then, was altered beyond recognition: changes such as the rapid growth of Mosedale—which had much enriched the Blackburn estate, by-the-bye—the old man had expected to see, but this strangeness of the material features of the landscape was entirely unlooked for. The home picture which he had had before his eyes for so many years in imagination, and which he had thought to see realised that afternoon, did not, then, even exist, but had been swept away with the generation which was familiar with it. Anthony ventured upon no more questions, lest he should learn that any of his usurping kinsfolk might have altered the Manor-house itself. But as the vehicle rapidly descended into the valley, where the village nestled beneath spreading elms, field after field was passed that he knew well, farm after farm, which, though with a new outbuilding here and there, were still very recognisable; the open green with apparently the self-same groups of children on it, and the same flocks of geese that he had seen there when he last beheld it; then the ancient ivy-covered church unchanged by a mere fifty additional years, and from which those bells were pealing blithely for his return, which had been forbidden to hail his marriage-day; and last the Manor-house itself, no stick nor stone of which seemed otherwise than the exile had figured it: perhaps the truth was, though Memory had enriched the picture with her softened lights, Time too, on his part, had invested the reality with his mellow charms.

Blackburn Manor was an Elizabethan mansion, not indeed of imposing size, but still of large proportions; with a broad stone terrace (upon which the peacocks strutted and screamed), approached by broad stone steps, with urns of stone ablaze with scarlet flowers. The whole face of the house seemed veiled from the evening sun by a network of greenery, out of which peeped many a blossom of rose and passion-flower; and upon the terrace balcony, as on the steps, the geraniums shone like lines of festal fire. These last had indeed been planted by order of the late Squire, to please the eye of his betrothed, but they now seemed to flash a welcome on the newcomers. A ring of 'ducking' villagers at the gates, and an obsequious courtesy from the lodge-keeper, was all they had hitherto met with in the way of greeting. The country-folk were puzzled as to the course of conduct they should pursue. Was joy at the reception of old Squire Anthony entirely to erase regret for young Squire Richard's untimely demise? or was a decent middle course to be adopted? In the carriage-sweep, however, and on the terrace steps, there was a considerable concourse of tenantry and others assembled to do their new master honour, who, the king being dead, were prepared to say, 'Long live the king!' Mr Mowbray Moffat, an ancient personage, much bowed in the shoulders, but with keen intelligent eyes, stood at the head of them.

'We are glad to see you back again amongst us, Squire, after so many years,' was his grave salutation; and 'Glad to see you, sir,' was echoed respectfully around.

There was no cordiality in the sound, however; nor indeed was it to be expected. Richard Blackburn, a youth of really noble promise, had been a general favourite; the heart of a landlord of seventy was not likely to be so impressionable as that of one of nineteen, and his dependants naturally enough regretted the change. Moreover, there were scarcely half-a-dozen present who had ever set eyes on Anthony before, and of course not one

Digitized by Google

who recognised him. Still, they all knew he had been badly treated; had heard from their mothers' lips the story of his dismissal from his ancestral home, and pitied him. It interested even the dullest to behold by his side the woman for whose sake he had sacrificed so much and for so long.

'She is for certain most uncommon lovely,' muttered one young tenant-farmer thoughtfully.

'Tut, man, that 's his grand-daughter,' replied his neighbour, laughing under his breath.

'Ay, true,' returned the other slowly, and with that imperviousness to ridicule which seems peculiar to the profession of agriculture: 'I had forgotten it was fifty year ago. But I daresay the old one was a dainty morsel in her time.'

'Hush, man; the Squire is going to give us a speech;' and, indeed, instead of taking advantage of the open chaise door, and the score of outstretched hands that offered themselves to help him down, the old man had got upon the carriage-seat, and was beckoning with his hand for silence.

'Neighbours and friends,' said he in a hoarse voice, 'I thank you for your welcome. You ought to know me well, though you do not. But that is not my fault, nor yours. I thought to stand here, thanking you for drinking my good health, as your young Squire, when I should have come of age, just fifty years ago. That was when Mr Moffat yonder was as young as any man here, and long before most of you were born. I am like a dead man out of mind to almost all of you.' Here the old man paused, overcome with emotion, and a sympathetic murmur arose from his auditors. 'I cannot expect that you should entertain much regard for a man of whom you have probably heard nothing but ill from those who have wronged him. But I was sent forth from this place a wanderer on the face of the earth, like Cain, for no crime, but because I fell in love with my wife. Or, rather, I was like Esau of old, with Ferdinand and Charles and Richard—all Jacobs—for my false brethren. That is not your concern, you would say. But when I thus revisit the home of my fathers, through the good-will of no man, but by the judgment of God, I cannot but feel some bitterness. However, what has been ill for me will be good for you, I hope, inasmuch as I have known, like some of you, what it is to be poor, to work with these arms for bread.' Again a murmur arose from the crowd around, and one man cried out 'Shame!' 'Yes, my man,' continued the squire, turning towards the spot from which the voice proceeded; 'it was indeed shameful in those who were the cause, for they not only drove me to work, in which there is no shame, but to want. That seems strange to you, does it not, that the rightful owner of Blackburn Manor, and his flesh and blood here, should stand in need of daily bread?' The old man pointed to Ellen, whose pale face, made paler by emotion, or perhaps apprehension of what her grandfather, in his passion against his brethren, might say, seemed to bear out the old man's words. 'I swear to you that this tender, delicate girl beside me has been in need of bread.' Every eye was turned towards her as he spoke, and very many were full of tears.

'O grandfather,' pleaded Ellen softly, 'pray, pray say no more.'

'Yes, my friends,' continued he, 'the things which we have suffered in our own persons are easily forgiven; but there are some wrongs—I say there are some crimes which even God does not pardon; at least, I have seen that he punishes those who commit them from generation to generation. This brings me to what I had in my mind from the first to say to you. I hope to be a good landlord, a good neighbour, a good friend to you all. In return, I would ask one favour of you. Do not speak to me—try to remember not to speak to me—of those persons who have preceded me here. I will never forgive them, but I would fain forget them. I do not wish, if it be possible, ever again to hear their names.'

These words, spoken so calmly, and with such earnest preciseness, seemed to freeze speech and motion in those who heard them; not a voice was raised, not an arm was stretched forth to aid him, as the old man descended from the seat, and quitted the carriage. As if afraid of that stern bearded face and those implacable eyes, the crowd drew back on both sides; and through the living lane thus formed, the Squire slowly climbed the terrace steps, and passed through the open door into his home.

His wife and grand-daughter followed more rapidly, each leaning on an arm of Mr Moffat.

HISTORY *VIÂ* POETRY.

IN TWO PARTS.—PART II.

We have unfortunately no picture of the ordinary 'housewife' from Chaucer's fingers: the Dutch manner of painting, as applied to interior details, was not in vogue in his day; but we have a charming virtuous maiden, such as there are now in ten thousand English homes, we trust, notwithstanding the Girl of the Period. And we have also a character into which she could never grow, the Wife of Bath. 'This is the portrait of a vulgar rich *bourgeoise* of the west of England, where they made good cloth. She would allow no one to go up the aisle to the altar to deposit her offering or to kiss the sacred relics before her. Her head-dress, heavy with many folds, according to the fashion of the times (so that the neck was often invisible), might have weighed ten pounds—on Sundays! She has scarlet stockings and well-greased shoes. Her red bold face and her talk together tell us enough of her story to enable us to understand why she had been sent on so many pilgrimages, and was now going on another. She sits well upon her pony, with a pretty veil or wimple, and has a hat as large as a shield. She wears spurs—perhaps she rides across—and has a cloth around her wide hips. She is a free talker, and free laugher, and we scarcely need listen to her prologue and story to guess that she is a shrew.'

The prioress, although she is not so coarse as this lady, is as commonplace. She is full of affectation and self-consciousness; 'of her smiling full simple and coy;' she talks French, that is

> Aftur the scole of Stratford atte Bowe,
> For Frensch of Parys was to hire unknowe.

'She knows how to behave at table, keeping her fingers dry, and not dropping her meat from her knife—because forks, of course, were unknown. She affected courtly manners; and had the usual false sentiment of over-accomplished women in any age: she would weep if she saw a mouse in a trap, *if it were dead or wounded*, otherwise it would

Digitized by Google

serve for a pet, like a bird in a cage. She had her pet dogs with her, which she fed with morsels from the table. If one of them happened to get hit by somebody's walking-stick, she cried. Her wimple covers her head, and hides her hair, but she has a well-marked forehead. Of her dress we are told little, because there was not much to tell of the attire of a religious person; but the lady had taken care to have her cloak well made. She wears a chaplet (called "a pair") of beads round her wrist, and her golden brooch bears a motto of the order in which the religion and the chivalry of the day may be said to have met and kissed each other: "Love conquers all things"—at the best an ambiguous motto for a religious fine lady.'

Again we have a pretty portrait of a vixen in that of the wife of Harry Baily the host, 'who, when he beats his servant-lads, brings out the thickest sticks, and urges him to break their bones out of hand—a pretty picture of the rights of a master and mistress in the days of Richard II. If people are not polite to the lady at church—St Mary Overy's, of course, is the church she went to—and if her husband does not resent the slight in a becoming manner, she calls him a milksop, and proposes to exchange her spinning-wheel for his dagger.' And lastly, we have a charming portrait of the old miserly carpenter's wife, aged eighteen. She is 'genteel' and slender. 'Her jacket is bordered or barred with silk. Her apron is white, and broad, being gored about her loins. Her "smok" open at the sides, and hanging by her shoulders like a pinafore, is "embroidered" with black silk, outside and underneath, where it shews. The strings of her white cap are of the same colour. She has a fillet of silk over her forehead, confining in front the peplum she wears over her hair. Her eyebrows are arched, and black. At her girdle hangs a leathern purse, ornamented with brass and silk. Her collar is low, so that her bosom has a chance of being seen, and it is fastened with a brooch as large as the boss of a shield. Her shoes are laced high up on her legs. She is as fresh as a primrose, and as dainty as a sucking-pig!'

Yet this fair young creature combed her hair opposite a metal mirror, or over a tub of clean water; was innocent of tooth-brushes, fed high, and drank beer in huge draughts.

Perhaps it was less easy to think delicately of women under such circumstances than it is now; but they were certainly coarsely treated, coarsely thought of. It was not unusual, we gather, for men to beat their wives in those times, though it was not held to be quite right to do so. The flogging of women in prison (a thing which would now set the whole country in a ferment) was a common thing. There were 'gags' and 'ducking-stools' for women who made themselves especially disagreeable. As for the chivalric idea of the fair sex, supposing it existed at all as a reality, that was for knights and dames only (a restriction which appears to us to have been fatal to its genuineness), not for burgesses, and much less for common people. Well may our author inquire: 'What effect did the romance spirit have upon the toiling swarms that the Black Death carried off by millions in medieval Europe? .... All this pageant of bravery and tenderness looks like a thing painted in the air, far over the heads of the multitude.'

In all medieval, nay, in all old writers, there is a tendency to jest, and somewhat brutally, against women; and Chaucer, notwithstanding his description of the maiden (Virginia), and his story of Griselda, was one of the chief offenders in this respect. But we are not, on that account, to consider that women were less faithful, or even modest in his day than they are at present. There were two reasons, according to Mr Matthew Browne, for this hard measure dealt to the fair sex. One was, 'the exaggerated and exaggerating conceit of men. In the time of Chaucer—a time when such a tale as that of Griselda could be accepted as presenting a type of womanhood not unworthy of imitation, however difficult the imitation might prove—the conceit of men, ranging as it did side by side with preposterous ideas of authority, dignity, and privilege in every direction, must have been, as we can plainly see it was, absolutely enormous. By the conceit of men, I mean their habitual estimate of their attractiveness to women from a low point of view, their superior importance socially, their rights over them, and generally their glory and grandeur in the scale of creation; including such notions as were founded on a false physiology, which, indeed, were, and still are, largely influential among the uncultivated and half-cultivated classes. One of Griselda's reasons for being ready to give up her child to be slain, is that it was *his*, her husband's—a reason founded on a mistaken scientific position.

'But besides all this, I fear I must add another reason, and that I think it was perhaps the strongest of all. That reason is the factitious prominence which certain topics acquire when the church of a country and its dominant religious opinion uphold the importance and dignity of celibacy, and large numbers of celibate men and women are present in society, contrasted by their peculiar position with the rest of the social body. If the pretence of what was called "purity" broke down often, as we know it did—if, in other words, the "celibates" were no celibates at all in a very large number of instances—we can imagine how much worse the case became, what perversion of the popular imagination followed. "If *these* checks, these rigid schemes of discipline, these awful oaths, do not suffice to bind people; and if these impulses are in themselves sinful, so that not even a sacrament of the church can do more than make them venial sins, and are yet so rife and so deceitful—why, what can we trust to?"' This explanation of the slights cast upon women by the writers in old times, appears to us to have great weight; and we cannot resist quoting another eloquent and forcible passage to the same effect. 'In the middle ages, the church had taken possession of all the critical periods of life. It had said: "There is nothing sacred but what we make sacred." Everything was, so to speak, excised and made to pay toll, in money or in sentiment, to the church. It seized the human being at birth, and said: "We must christen him, or he will be lost." It took him up again at marriage, and said: "The instinct which underlies the attraction of sex is deadly sin, but we will do what we can for you, and by a sacramental process we will convert this foul, corrupt, and damnable thing into something venial." It pursued the human being to his death-bed, and sent him out of the world with the tolling of a sprinkled bell (necessary for frightening away evil

Digitized by Google

spirits) and the "sacrament" of extreme unction. From first to last it took possession of humanity; would neither let it come into the world, increase the world, or go out of the world without its authoritative interference—in the sense, not of a willing helper, but of one who had property in a vassal or villein, and could pronounce him and all his possibilities unclean and damnable, if without ecclesiastical sanction for his very existence and all his functions. Pleasure or delight was the especial hatred of an asceticising church; and, above all, the delight which we habitually roof over in our thoughts with the words "a happy home."'

One of the points which has always been much disputed in the comparison of ourselves with our remote ancestors is, whether, upon the whole, with all our civilisation and knowledge, we are *happier* than they—whether England deserves the name of 'Merry' so much as it did of old, or not. Now, Chaucer is the very man to tell us the truth about this; he described what he saw most accurately, and he had a keen sense of enjoyment, so that he would probably see all that could be seen in the way of merry-making. 'We look back through the mist of centuries as well as we can, and taking Jack-in-the-green on the way, permit our eyes to rest upon a heterogeneous picture of gabled houses, splendid shows, glancing colours, and rapid movement, with plenty of music. The midsummer watch is set, and the watchmen, with their cressets, walk the streets. Or the garland is stretched overhead, and the girls are dancing. Or the butts are fixed, and the lads are out in the meadow with their bows and arrows. Or the fool, in motley, shakes his bells and plays his pranks in some gay procession. Or the young Cockneys are up and abroad early in the first of May, to fetch in the sweet-smelling boughs. And somewhere in the air is the sound of the timbrel, shaken, as we guess, by a healthy maiden, and the ringing of bells, and even the horn of the huntsman, for perhaps the chase is up in Epping Forest. Was there then more *gaieté de cœur* in this England, or in a still younger England, than in the England that we all know to-day?'

There was certainly more public carousing, more 'set' holidays, and mirth to order; but it will not seem paradoxical to thoughtful readers to remark, that though the growth of personal freedom promotes happiness, it need not promote obtrusive visible merriment in a people. Nor does it. 'That external gaiety, that loud-voiced muscular mirth, that zest in pleasure, as distinguished from business or duty, which we think we notice in the merry England of our ancestors, is, in fact, the gaiety of half-cultivated creatures, who love noise and bluster, just as savages do; but in part it is the gaiety of a common people who were not free. It is the characteristic of the slave to make a noise over his pleasures when the hour of relaxation has struck. In the time of Chaucer, Englishmen had ceased to be slaves, the lowest and meanest of them; but the condition of the common people was of the kind in which the burden is felt, though the chain is away.'

The merriment of men and women in whom a sense of inferior position is nourished by a system of social privilege, is apt to be explosive. In an age when an architect could impress workmen and pay them what he chose—as William of Wykeham impressed labourers for his works at Windsor Castle—to have a holiday, to be set free from work, was to be set free from much more than work. Uproarious joy, while it lasted, was a sort of defiance of privilege, and yet it was often 'a mendicant joy.' The holiday-maker (to judge him by the ballads of his time) was a beggar also, and asked for largess. Our author has these and other excellent reasons to give why he 'cannot follow those writers who go into raptures over the feudal spirit, as if it had a natural tendency to make life joyful.' To place the ease or wellbeing of the individual in his own power, by making life universally convenient, that is the modern notion. To *make* the individual happy or jolly by efforts addressed from the outside, in a patronising manner, which ran naturally into splendour and gewgaw, that was the medieval view. We agree with Mr Matthew Browne that the present method is by very far the best. Moreover, as he suggests, even these scenes of festivity did not occur so often as one is inclined to imagine; they were picturesque incidents, and therefore were of course made the most of by the chroniclers of the time, and alluded to as often as possible. Even we, with all our modern advantages, might lead our descendants into great errors about ourselves if they mistook 'prominence' for 'frequency.' 'Look, for example, at the prominence which the topic of mountaineering assumes in newspapers and magazines! If an antiquary of five hundred years hence were to say that mountaineering was a common pastime of the English people, he would not make such a very bad hit for an antiquary, but what nonsense it would be!'

At the same time, it is likely enough that there was more unthinking joy in those days, more of well-founded hope—for how much of light and liberty was to come—than in our own. We are thoughtful, philosophic, regretful; in Chaucer's time, cakes and ale were in greater repute, and gave more pleasure than now. Our poets are no longer 'lightsome,' and, as our author remarks, it is curious to see how Autumn is a prominent symbol, or source of symbols, with them, whereas with Chaucer, and those after him, Spring was the favourite season. This is sufficiently marked to be significant, even after due allowance is made for the fact, that the badness of indoor accommodation, even in the best mansions, sent people earlier out-of-doors to meet the summer than they go now. Moreover, what delights there were of old (except as concerns theatrical display) were of a more striking and picturesque sort than at present. 'Think of my lady in green and gold, with her hair tossed and tangled by the wind in the morning sun, riding her pretty palfrey at a conscious *allegretto*, with the bells of the birds making music, and the excitement when the quarry is well in sight and the hawks go free from my lady's hand. . . . . Whether you could buy the best hawk-bells at Milan or at Dordrecht, was a nice question; and whether the bell on the right leg ought to be a semitone or a whole tone above the bell on the left, was another. We may well imagine a bevy of ladies out hawking on a sweet, fresh morning—it was said they hunted with hawks better than men, and I can well believe it—finding plenty to occupy their charming little tongues in discussing such questions.'

Or, again, let us take a town picture, of the

Digitized by Google

Southwark folks coming in with boughs of May on the first of that month, and of those whom they meet in the streets where we now walk, without much thinking of our predecessors. 'One of these troops of Mayers, largely sprinkled with gawky boys and girls, is sure to find its way into the courtyard of the *Tabard*, and howl and jump till some of the guests throw them a largess. Or imagine a troop of jugglers or mummers, or a group of morris-dancers, with flags and garlands, attended by very energetic minstrelsy. While the dancing, singing, and mumming are going on, a scene full of movement and colour at all events, a maniple crosses the road from St Mary Overy, and a nun, perhaps, comes toddling from the priory at Bermondsey. I think nuns always do toddle, walking as if they had stones in their shoes. Perhaps the beadle comes by, holding by the collar somebody who is going to be put in the stocks; an abbot on a nag; a lady on a palfrey with her wimple down; or a page all in crimson and blue, who being charged with an urgent message, inevitably stops to look at the mummers; and, besides the loss of time, forgets half his business, for which his white-handed mistress, who is just now breakfasting on beef, salt herrings, and beer, will soundly cuff and rate him, later on, swearing at him by Goddes bones or Christes foot. The "long-haired page in crimson clad" makes better haste back than he did in going, and on his way hears the bell of St Mary Overy strike the hour. He is not disposed to linger for so familiar a sound, and perhaps, like Chaucer, he does not care for music; but in the Ladye Chapel he hears chanting. What he would *like* is a row across the Thames, say to be ferried to the Tower, where he could, perhaps, look at the wild beasts, by favour of some acquaintance of his among the soldiers, whom of course he greatly envies. The river runs bright and clear, between banks which are green enough to keep alive its recollection of the Cotswold Hills; and the gardens of the citizens slope down to the banks. The page is too accustomed to the sight to notice the little boats, laden with piled-up rushes, some of them, perhaps, for the floor of his mistress's boudoir. The Thames eddies and whirls with a great noise around the clumsy piers of the bridge, but he does not notice that either, as we should if we were dropped down upon the London bridge, which had a crypt underneath it. From every point the fields are in sight. He can see windmills turning, kine browsing, almost hear the tinkle of sheep-bells; but all this has no particular charm for him; he prefers a stroll in Paul's Walk to shew off his long hair, his pointed shoes, his new black and red trousers, and the paltock with the gilt edging, which he carries jauntily over his shoulder, something like a hussar jacket. Here comes a black friar, hastening to a deathbed. And here the odd figure that reflects the motley of it all. We all know him in *Twelfth Night*, and in *King Lear*, and at the Circus; but how astonished we should be to meet him in the street, himself part of the motley, or in the hall of a friend's house, before dinner, with a cock's comb, ass's ears, and a bladder full of pease at the end of a stick.'

If there was much motley in the streets, much diverse colour of garment, all was laid aside at night for flesh-colour. It seems certain that in Chaucer's time, even those connected with the great, such as he himself was, slept with no other covering than the bedclothes. 'As naked in my bed I lay,' says he, more than once, and he is a writer of accuracy. We learn from his evidence that the cottages of the poor were sooty because they had no chimneys to carry off the smoke. Even the carpenter, who was a rich man in his way, lived in a house which had no first floor. At dinner, guests were paired, and ate, every pair, out of the same plate or off the same trencher; and the use of napkins and finger-basins was obvious enough, since there was no such thing as a fork. Even the most fashionable folks in those days were what we should now call very dirty people. Nor must it be forgotten that it was something with those far-back ancestors of ours to be sure of dining at all: not only because the science of the Commissariat was but little understood, and Want might be at one spot, with a glutted market within a few miles, but also because one's personal liberty was always doubtful. 'Any king, queen, lord, or lady might have to eat prisoner's food; a fact that made it worth while to blow trumpets before you ate or drank your fill, and of which a trace remains in the Litany of the Church of England, "That it may please Thee to shew thy pity upon all prisoners and captives." As to the cooking, our author is of opinion that the articles to cook with were much the same as now; but certainly porpoises and peacocks are, in these days, very uncommon; and, on the other hand, we should doubt if a medieval *chef* could have possessed any article in which he could have cooked whitebait. Men were more from home than at present, and women had therefore leisure to make a complicated, if not a very perfected science of the art. 'When we look at the astonishing cookery of our ancestors—when we note the intrepid manner in which they put, or told you to put, fifty different ingredients into a dish or a drink—we wonder where they found time to do it all. Turn to an old receipt-book, and observe the easy indifference with which you are told, if you want a tansy-pudding or a basin of gruel, to "take" a score of the most impossible things in the world. *This*, too, is to be gathered when the moon is at the full, and *that* when the dew is on the grass: the witch-broth recipe in *Macbeth* is nothing to it. The ladies must always have been getting up at day-break, or watching for eclipses of the moon, or catching salamanders, or tying up marjoram, sassafras, borage, or mint; getting in benzoin, zedoary, gum this and gum the other—or else how did they produce those astounding boluses and electuaries?'

Thus from religion to cookery, our author has contrived to put old Chaucer into the witness-box upon all the social subjects of his day; not in matter-of-fact cross-examining manner, but with infinite assiduity and discernment, and again has set the evidence before us in the most winning and convincing way. No writer, we repeat, since Leigh Hunt has left us, has shewn himself so full of alacrity and grace, of appreciation and judgment, as the author of *Chaucer's England*. In some respects, he is even his superior. There are some reflections scattered through these volumes, not on literature, but on human life itself, which are beyond Hunt's last. For instance, here is a truth which few have had the wits to recognise, and still fewer the courage to write: 'No man can know another man as that other man knows

Digitized by Google

himself; and I am unalterably of opinion that a human being's estimate of his own character and worth is usually far more truthful than the best estimate that can be made by all the ingenuity of his friends put together.'

PIT CATASTROPHES AND RESCUES.

ARE we or are we not to derive useful lessons from the terrific accidents in coal-pits, so often narrated in the newspapers, and so harrowing to read? Holding an inquest, and subscribing funds for the relief of bereaved wives and children, are both right enough; but half the work is left undone unless useful facts for future guidance are collected and recorded. Most of these appalling disasters arise either from fire-damp or from choke-damp—fire-damp kindling by the flame of candles and lamps, and burning up everything and everybody; or choke-damp stifling the poor miners with carbonic acid. Here the lessons to be learned are mainly those connected with ventilation and the safety-lamp. In the smaller number of instances, where a flooding with water, or the falling in of the sides of a shaft, has produced the mischief, researches and precautions of other kinds are obviously suggested. But experience has now taught us pretty clearly to learn this additional lesson—not to believe that even *a week's starvation* will necessarily kill the poor fellows who are deep down in the mine.

In the remarkable escape from the Edmonston Colliery, in Scotland, some years ago, the occurrence was neither the explosion of fire-damp nor the flooding of the workings, but the shutting up of one of the passages by a mass of brick and timber; nevertheless, the lesson taught was the same, to encourage hope until hope itself dies. A portion of the side-lining of the colliery shaft fell in, and the débris was sufficient in quantity to fill up from the bottom of the shaft to the level, and above the level, of the workings. Fortunately, there were only a few persons down the pit at the time—thirteen in number. It was before the termination of that disgraceful period when the gentler sex as well as the rougher was employed in mining; four of the persons were women. The attention of the men above ground was at once directed to the ventilating shaft, a few hundred yards distant from the main shaft; it was known that a horizontal air-passage extended from the one shaft to the other; and a fair probability appeared that the buried miners, unable to force a way through the mass of rubbish in the main shaft, would bend their steps towards the other, and there look for succour. Several men consequently descended the ventilating shaft; but the air was too foul to enable them to reach the necessary depth of five or six hundred feet; and after two attempts they desisted. Attention was then directed again to the main shaft, a mode of rescue planned—necessarily slow, but the best that could be thought of. A wooden cylinder or 'crib' was made, the same diameter as the shaft, to fill up a certain space while the rubbish was being removed. While this was in preparation, a messenger arrived in haste to say that feeble voices had been heard down the ventilating shaft. Of course all hands hastened thither, with a renewed hope of being able to effect a rescue. Men descended, battled courageously against the foul air, and shortly returned bringing up the youngest of the four women. Her first exclamation was: 'Eh, sirs, we have been praying a' nicht.'

Now what had the poor imprisoned thirteen been doing all this while? They soon ascertained the hopelessness of trying to remove the rubbish which blocked up the opening of the horizontal passage into the working shaft; they tried that passage to the other end, but, as it was only three feet high, and nearly filled with water, their progress was speedily barred, and they returned to the workings, which were in a sort of midway position. They knelt down to pray, and ponder on their miserable condition. Forenoon, afternoon, evening, night passed. At six o'clock next morning, they made another attempt to reach the ventilating shaft, and were again frustrated. Then their candles went out, and they sought a dry place where they might lie down to die. They sang a hymn, and prayed, and thus passed the second day. At five o'clock on the following morning, they raised courage to make one more attempt; and this time with good success. They found the water in the horizontal passage two inches less than on the preceding day, though still reaching up very near to the roof. They groped through, with their faces so turned up as to be above the level of the water. Two of the men who had the best knowledge of the way took the lead. All formed a chain, holding on by one another's garments, and the men carrying the women as best they could; one strong man carried the weakest woman on his back, and at the same time dragged along the weakest man. It was perilous work, for unless the mouths could be kept above water, survival would have been impossible. After two hours' laborious and anxious toil, they arrived at the ventilating shaft, where their feeble shouts were fortunately heard by the persons above. All the thirteen were, one by one, brought up, and restored by kind and judicious treatment.

In this case, the plan of operations at the main shaft was not needed; but the result shews that both those above ground and those below were fully justified in continuing their search for a rescue, even when timid hopers had looked upon death as speedy and certain.

The recent wonderful episode at Brierley Hill affected exactly the same number of persons—thirteen; but the duration of their misery was far greater. About two miles from Stourbridge, at Brierley Hill, are certain collieries belonging to the Earl of Dudley. On 17th March last, in the dusk of early morn, the men above ground at the Nine Locks Pits became aware that there was something wrong below; water from some unknown source was rushing into the shaft; it rose above the level of the working passages, entered them, and flooded the mine. Fortunately, the number of persons below was only small; but to extricate these alive seemed an impossibility. Nothing could be done but to set the powerful pumping-machinery to work. Five successive days did this process continue, until an enormous quantity of water had been pumped up. Early on the morning of the 21st, just about a hundred hours after the flooding, and during a momentary stoppage of the pumping, the men above ground, to their infinite astonishment, heard faint cries from the bottom of the upcast shaft. They all set to work on their new duties eagerly, but seven hours elapsed before they

Digitized by Google

could reach the workings. They found four men and a boy, faint and exhausted, but still sensible; these they carefully brought up. But where were the other eight? On the same evening they found the dead body of one poor fellow, who had wandered away deliriously about a hundred feet from his companions, undressed, and lain down to die. The other seven, five men and two boys, were known to be in deeper workings. More pumping was necessary. At three o'clock on the morning of the 22d, some of the explorers penetrating the deep workings heard a feeble 'All alive!' in response to their shouts. By wading, swimming, and rafting, in passages nearly filled with water, they reached a spot where four men and two boys were assembled; these they tenderly handled and safely rescued. A few hours later the last man was found, insensible, and terribly emaciated, yet still alive.

But all the above-ground proceedings sink to mere uninteresting details compared with the story which the rescued miners had to tell. We will shape the scattered narratives into diary, for the sake of distinctness.

Tuesday, 16th March.—The men and boys went down to take their wonted turn at work during the night; and as the hour of descending was late in the evening, we may at once pass on to the events of the next day.

Wednesday, 17th.—Between four and five o'clock in the morning, one of the men rushed to the others and cried: 'For God's sake, make haste and save yourselves; we shall all be drowned!' Water had entered the workings, in immense quantity and from an unknown source. They ran towards the spot where the horizontal gallery opened into the vertical shaft, but could not reach it by a long distance; for the shaft was full of water far above the level of the opening, and a long way into the gallery itself (which inclined a little upward from the shaft towards the workings). The thirteen men and boys appear to have been working in two gangs at some distance apart; and these gangs had different stories to tell, although alike in general character. They groped to the edge of the water, entered it, waded in it, and sought for any possible means of reaching the shaft; but they were driven back in despondency. At length the increasing foulness of the air extinguished all the lighted candles, adding the horrors of utter darkness to their other miseries. The boys were hungry, and the men gave them what remained of the food taken down over-night.

Thursday, 18th.—Rousing up after snatches of feverish sleep, in profound darkness, they could hear powerful pumps working, and thereby knew that the people above ground were doing their best to empty the flooded shaft. But the imprisoned miners themselves could render no aid towards their own rescue. They gave up all idea of swimming or wading in the water, or even of drinking it to quench their thirst—so utterly foul, stinking, and loathsome was it. The workings, too, became filled with such contaminated air, that it was wonderful how respiration could be maintained; the men managed it by lying down close to the point where the water reached, and catching the air that came with the ripple caused by the pumping. But what air it was! The men could not see each other even when close together, so total was the darkness. They placed lumps of coal at the edge of the water, as gauge-points to determine by degrees whether the water advanced or receded; it advanced, and their hearts sank within them.

Friday, 19th.—Another day in this living tomb. They contrived to measure the lapse of time by carefully *feeling the hands of a watch* possessed by one of them; and this watch was kept duly wound up, as the only available means. Sometimes the men would venture to grope a little way, to search for a possible breath of purer air, or a draught of water a little less foul than the rest; but they kept mostly together, and near the edge of the water. The boys tried to forget their hunger in sleep, huddled in the arms of the men. Some of the men wrote notes to their wives, taking a last farewell in homely but touching lines, and put them in their pockets or tobacco-boxes; and one of them was particularly anxious that the much-treasured watch should be regularly wound up, as he thought it might afford some clue to shew about what hour they all died.

Saturday, 20th.—Each day was now very much like the preceding—no food, no water that they could drink, no light. Yet it is plain that the air must have become less vitiated, otherwise suffocation would infallibly have ensued. Some of the poor fellows chewed small bits of coal; and one of the boys cut out the leather tongue of his boot and eat *that*. The leather-munching *did* bring some kind of moisture into the mouth; but it is hard to understand how coal could have done the like.

Sunday, 21st.—One of the men, Benjamin Higgs, began to wander in his mind, and to shew a tendency to start off in the dark and quit his companions. He was the owner of the watch which had hitherto told them how the weary time was passing; and they feared to lose both poor Ben and the watch. The water was sinking, very slowly; but they had hardly strength to follow the receding edge—hardly strength to do aught except lie down. This was the day when the men in the upper workings were able to reach the upcast shaft, and utter the feeble cries which led to the rescue.

Monday, 22d.—At last the poor fellows in the lower workings, only just sensible, heard distant voices, and saw lights as if floating on a raft on the water. Their 'All alive!' brought them speedy aid; and when one of the rescued said to one of the rescuers, an old companion, 'Hullo, Yorkshire!' it was no small delight, we may be sure, to 'Yorkshire' and the rest of them.

How the twelve were tended, nursed, and restored, need not be told here. The point we would dwell upon is, the marvellous power of sustaining life exhibited on this occasion. Higgs, the last man, had been in his terrible position from five o'clock on Wednesday morning till two o'clock on Monday afternoon—a hundred and thirty hours. With the exception of the first few hours, during the whole of this long period he was utterly without food, drink, or light, and had only vitiated air to breathe. Nor was it otherwise with the two collected groups, who had been about a hundred hours and a hundred and twenty hours respectively, in their living tomb; they had all passed through a similarly astonishing ordeal of hunger, thirst, darkness, and unwholesome respiration; and their vitality had similarly withstood all these trials. If the people above ground, under the conviction that

Digitized by Google

all were dead below, had slackened the pumping, the mouths of the side-passages could not have been cleared of water until after Sunday and Monday; and probably by that time life would have been extinct. The miners hovered round the pit's mouth day after day, hopeful to the last, ready to descend to the rescue at a moment's notice, and listening ever and anon for any sounds of voices below. They were right; their listening and their promptness were effectual aids. Where the water came from, was a question for the engineers afterwards to ascertain; at anyrate, there were fifty thousand gallons per hour pumped out for six days. Doubtless there is still much to be ascertained about ventilation and drainage, but we have at least learned *this* lesson—not to be *quite* certain that six days' abstinence from food, drink, and light will necessarily kill a man.

SLANDER AND LIBEL.

IAGO tells us that good name in man or woman is the 'very immediate jewel of their souls;' and we have it on the same unquestionable authority that 'he who filches from us our good name robs us of that which not enriches him, and makes us poor indeed.' The English law has endorsed both these statements of the Venetian, and has on the one hand provided a set of safeguards for the security of the 'very immediate jewels,' and on the other a series of punishments against those who in any way contribute to dim their lustre.

Formerly, the law was very careless about the reputation of any but that of the great men of the kingdom. Perhaps people did not backbite in those days—perhaps it was only the great folks' reputation that lay open to attack. From whatever cause, the laws of England did not take cognizance of slander or libel as offences if uttered concerning ordinary people. Such complainants were referred to the ecclesiastical tribunals, which could admonish slanderers, impose penance upon them, and caution them, as they loved freedom from correction, to behave better in future; but redress for injury done by backbiting the law gave none. As between the king and his subjects, whether barons or not, and as between barons and persons of inferior rank, the law was made stringent enough in the matter of slander. It was probably due to the numerous misunderstandings, accompanied by bloodshed, which arose between Henry III. and his people, that the statute of Westminster the First (3 Edward I. c. 34) included in its provisions a law for the punishment of those who reported slanderous news whereby discord might arise. Indeed, the law itself asserts almost as much in its preamble: 'Forasmuch as there have been oftentimes found in the country devisors of tales, whereby discord, or occasion of discord, hath many times arisen between the king and his people, or great men of the realm .... it is commanded that from henceforth none be so hardy to tell or publish any false news or tales whereby discord, or occasion of discord, or slander, may grow between the king and his people, or the great men of this realm; and he that doth so, shall be taken and kept in prison until he hath brought him into the court which was the first author of the tale.'

This punishment looks very much like perpetual imprisonment, for how a man who was in prison could manage to find a man who was outside, and bring him into court, is a question that might have puzzled even the framer of the statute. Practically, however, it probably meant imprisonment during pleasure. The nobles in Richard II.'s time felt the annoyance of slander which came 'betwixt the wind and their nobility,' and procured the statute of *Scandalum Magnatum*, a law which punished with considerable severity those who told 'horrible and false lies' of the great men of the realm. Another law of the same king punished those who defamed any of the great public officers. These laws, however, protected only the reputation of king and barons; and it was left to a later time, and to an unpopular court, to devise a safeguard for the character of ordinary men and women.

The Star Chamber was the place where the law of libel, as it has come down to our times, was moulded; and though in this, as in other particulars, the court came to strain its authority to the oppression of the subject, there cannot be any doubt that it supplied a manifest want in the common law, by prohibiting, under penalties, the clacking of idle tongues, and the wagging of pens by malicious holders. Hudson, a barrister who practised in the court of Star Chamber, tells us that 'in all ages libels have been severely punished in this court;' and that in the eye of the court a man was guilty of libel who 'scoffed at the person of another in rhyme or prose;' if he personated him 'thereby to make him ridiculous;' if he annoyed him by parading his effigy in a contemptuous manner; 'or by writing of some base or defamatory letter, and publishing the same to others, *or some scurvy love-letter to himself, whereby it is not likely but he should be provoked to break the peace;* or to publish disgraceful or false speeches against any eminent man or public officer.'

As a proof that Hudson did not exceed in writing thus, there remain records of cases where men were convicted and punished for speaking 'certain words against the Lord Cardinal,' for using uncivil words to the sheriff of London, and for saying that Lord Dyer, judge under Queen Elizabeth, was 'a corrupt judge.' In Charles I.'s time, a barrister was brought before the court for having advised a client that a commission issued by James I. was illegal; John Selden was summoned on account of a passage in his *History of Tithes*, wherein he had thrown doubts on the divinity of the right of the clergy to have tithes. Some law students of Lincoln's Inn were charged before the court with having, at a wine-party, drunk 'Confusion to the Archbishop [Laud]!' The informer was their own servant; and the Earl of Dorset, who sat at the board, took advantage of the circumstance to excuse the students, by suggesting that the man, being constantly in and out of the room, had not heard the whole of the toast, which he said was most likely, 'Confusion to the Archbishop's enemies!' The students were dismissed with a reprimand and a caution.

The punishment for libel varied according to the character of it, and according to the temper of the court. Sometimes a fine was imposed, sometimes the defendant's ears were cut off; or he was branded with F. A. (false accuser) on the face, and his nose was slit. John Stubbs, the Puritan, who wrote a pamphlet on the proposed marriage of Queen Elizabeth with the Duke of Anjou, was taken, with his publisher, to Palace Yard,

Digitized by Google

Westminster, where their right hands were stricken off by the common hangman; and it is recorded of Stubbs that, as the executioner maimed him, he took off his hat with his remaining hand, and cried: 'Long live Queen Elizabeth!'

A distinction, which has been preserved down to the present day, was early taken between defamatory matter spoken and the same thing written, the law making very justly a liberal allowance for what a man may say suddenly, on the spur of the moment, and upon provocation. There are also many words, both nouns and adjectives, which are strictly applicable to scoundrels and others, and the uttering of which is a great relief to the feelings of a highly wrought man, which the law does not consider in the light of a real injury. It is not our province to state what these words are, but they may be calculated by reference to the standard of what the law does consider to be injurious slander. The standard is this—anything is legally slanderous, and therefore actionable, which may put a man in peril of the law, to accuse him of some crime, as that he has committed murder, or has perjured himself; anything which may exclude him from society, as to report that he has a leprosy or other infectious disease; anything which may injure him in his trade or profession, as to call a tradesman a bankrupt, a physician a quack, a lawyer a knave or a pettifogger, a magistrate partial or corrupt. Mere abuse the law will not notice, as when a man is called a thief or a humbug, but there is no intention on the part of the abuser to impute that he has actually stolen anything, or that he has cheated anybody by fraud. Mere scandalous words, imputing matters which are liable to censure in the ecclesiastical courts, the law will also not notice, so that it is not actionable to call a man a heretic, or to call a woman unchaste, unless the latter happen to be a denizen of the city of London. In that case, an action will lie in the city courts by virtue of the custom of London, which recognised a woman-trader, and protects her accordingly; and as to say of her that she is unchaste would tend to injure her in her business, the remedy is given against the slanderer.

Although, as said above, an action will not lie for merely abusive words, yet if a man or woman can prove that special damage was the consequence of the words spoken, the law will give redress. So that if a woman can shew she has lost a marriage through an imputation of unchastity, or a man can shew that he has been damaged by imputations, say of heresy, which have resulted in some substantial loss to him, redress will be given. For the rest, however, the maxim of law is that 'Hard words break no bones.'

For the advantage of everybody, and in the name of common-sense, the law does not consider as actionable certain communications which are nevertheless of themselves slanderous in their nature. Thus, in giving the character of a servant, a master or mistress may state things, so long as they do so in good faith, and not maliciously, which otherwise would be punishable as slander. It is also a good defence to an action for slander, if the defendant can prove the slander to be true, for it is considered monstrous to allow a veritable knave, a quack, or impostor, to call another man to account for having said, unavoidably, perhaps, and in the interests of truth, that which is indisputable.

A different view is taken of the more deliberate act of writing. People are not supposed to write in a passion, and words which, if spoken, might be excused on the ground of hastiness, assume a malicious complexion when they are quietly written down on paper. When written, they constitute a libel, in the legal sense of the word; and the law provides compensation in damages for injury done to any one by them, and also allows of their being treated as an offence against the state, because they tend directly to a breach of the peace. When proceeded against criminally, and convicted, a libeller may be sentenced to fine and imprisonment. All words which are actionable as slander are actionable also when reduced to a libel; and the law includes, in addition, under the latter head, all contumelious matter that tends to degrade a man in the opinion of his neighbours, or to make him ridiculous. It was held to be libellous to write of Lord Redesdale that he was a 'stout-built special pleader;' to write of Lord Hardwicke that he was 'a sheep-feeder from Cambridge;' and it was held in a famous case to be a libel by writing and publishing 'to possess the people with an ill opinion of the government—that is, the ministry.' In 1777, Horne Tooke was condemned as a libeller for having announced that he was ready to receive subscriptions 'for the relief of widows, orphans, and gray old men of our beloved American brethren, who, true to their character as Englishmen, preferred death to slavery, *and on this account were brutally murdered at Lexington and Concord by the king's troops.*' In 1790, the proprietor of the *Times* was sentenced to a year's imprisonment for libelling the Prince of Wales, because a statement had appeared in the paper that the prince 'had had differences with his father.'

There are blasphemous and seditious libels which tend to the subversion of public morals, and of the people's loyalty to the government. John Wilkes, the demagogue, or, as the Earl of Chatham called him when protesting against the conduct of the House of Commons with respect to him, 'the blasphemer of his God, and the libeller of his king,' was convicted of this kind of libel on account of his *Essay on Woman*, and his paraphrase on the *Veni Creator;* and it was while he was undergoing imprisonment in pursuance of the sentence that he was elected, under circumstances of great popular excitement, to the vacant seat for Middlesex.

Who is to determine what is a libel and what is not? Of course, when the Star Chamber existed, its members decided the question; and when, the Star Chamber being abolished, the mantle of its jurisdiction in libel fell upon the common-law judges, the judges arrogated to themselves the power to say whether a matter was libellous or not. The judges after the Restoration, and down to quite recent times, were the nominees of the crown, and dependent upon the court favour for a continuance in their posts. No wonder, then, that they were apt to construe adversely to the writer anything which might seem to tell against the power that could unmake them; no wonder that, being in the habit of treating libellers of the government as wicked persons, they got into the way of regarding libellers generally in the same light. Anyhow, the convictions were many, and frequently were founded not so much upon

Digitized by Google

precedent, as upon what happened to be the fancy of the judge at the time of the trial. A jury was certainly empanneled, but the only questions they had to decide, according to the doctrine enunciated by the judges, were, whether the prisoner or defendant had written or published the libel, and whether the expressions complained of really bore the meaning they were alleged by the indictment to bear. The question whether the matter published was libel or not, was held to be a question for the court.

The confusion which a number of dicta, more or less partial, introduced into the law of libel, and the possibility of punishment which haunted even the most moderate critic on public affairs, or public men, became gradually intolerable. Certain prosecutions which took place in 1784 on account of matter which would pass unnoticed beside the most ordinary newspaper criticisms of to-day, roused a spirit of resistance, which found expression in Mr Fox's Libel Act of 1792. Not without staunch opposition did the measure become law: the government was unwilling to surrender a power which was so eminently destructive of its foes; and the lawyers of the day, excepting Lord Camden and one or two more, were opposed, as lawyers generally are, to innovations on established rules. But Mr Fox persisted, and aided by the spirit which the late prosecutions had aroused, carried the bill. The bill took away from the judges, and gave to the jury, the power to decide what was a libel; and the law now requires the judge at the trial of an action for libel to define to the jury what a libel is in point of law, and then to leave it for the jury to say whether the matter complained of falls within the definition.

The old rule, which allowed of slander being justified by the plaintiff proving the truth of it, was not allowed to apply in cases of libel until the present reign. Lord Mansfield only summarised the principle of the old Star Chamber procedure when he enunciated the maxim: 'The greater the truth the greater the libel.' It was supposed that such a principle prevented careless statements from being made, and that tale-bearing would be prevented. At the same time, it was supposed that the practice of duelling kept men in check, and stopped them from becoming brutal and offensive. Both ideas have been exploded, and an act of her present Majesty allows of people pleading by way of defence in a libel suit that the matter complained of is true. As a check, however, upon carelessness, perhaps also because of inability altogether to quit the old groove, it was provided at the same time that any one justifying the libel must shew that it was for the public benefit that the accusation should be made known. The same act afforded relief to editors and proprietors of newspapers and other periodicals, who under the old system had been held liable absolutely for any libels inserted in their publications. Such persons may now plead that the libel was inserted without malice and without gross negligence, and that as soon as possible after the character of the libel was brought to their knowledge, they inserted an apology in the offending publication. They must also pay a sum of money into court, to be at the disposal of the verdict, as proof of their willingness to recompense the plaintiff for any harm unintentionally done to him. Until a comparatively recent date, the law was such that it did not screen from an action the *bonâ fide* reporter of the proceedings in parliament; and it happened that words spoken by members of parliament, and for which they had the protection of parliamentary privilege, were made the ground of actions for slander and libel against the regular reporter and publisher of them. But this state of things could not be allowed to continue; and on damages being recovered against Mr Hansard for libel contained in a member's speech which he had faithfully and honestly reported, the legislature saw fit to protect their reporter so long as he acted *bonâ fide*, and passed an act to bar all actions against him for libels published in his official capacity. During the last session of parliament, a bill was introduced yet further to diminish the liability of editors and proprietors who have merely reported honestly the matter complained of, whether contained in a speech or otherwise. The remedy of the injured person is thus removed from against the reporter or publisher to against the original false accuser, who, speaking in a place where he might know his words would be reported, must bear the responsibility of his slander being converted into libel.

The object of the law as it now stands is to protect the character of all under the law from injury springing from a malicious tongue. Rogues and rascals of all kinds must lay their account with being called by their right names, without having the assistance of the courts to help them to damages. But the law at the same time will not encourage tattling; nor does it think it desirable that every filthy story, every blot on the fame of mankind, should be described in glowing colours, and trumpeted forth to the world. Hence it is, that before it will admit the plea of justification in answer to the suit of a plaintiff in libel, it requires in addition to proof of the truth of the libel, proof that the publication of it was for the public good.

HARD-UP.

'Come in!' I shouted.

'That's cool!' exclaimed Fred, as he darted into the bedroom, to hide his coatless person; then in strode Tom Brooks, looking very buttoned up and tight about the person, took the chair just vacated, pulled out a pipe from its worn case, helped himself from the jar of bird's-eye tobacco upon the table, lit up, and began to smoke.

'Where's Freddy?' he said, opening his lips for the first time, disallowing the slight parting for the admission of the pipe, for, upon entrance, he had confined himself to a slight nod. 'Where's Freddy?'

'Here he is,' said that individual, who had been listening, and recognising the voice, now made his appearance, coatless and bootless, and advanced sulkily to the fireside.

'Hot, ain't it?' said the new-comer with a shiver, as he glanced at Fred, who growled, banged the bit of fire about a little, and then emptied the battered coal-scuttle, so as to renovate the failing blaze. The next minute, Fred had drawn up another chair, relit his pipe, and begun smoking furiously, as, placing his hands deep in his pockets, and his heels upon the fender, he worked his toes about in his gray stockings in a wonderfully elastic way.

Digitized by Google

Then came a pause, during which we all smoked furiously, till Tom Brooks leaned forward, and drawing the large pewter tankard upon the table closer towards him, raised the lid by pressing it with his thumb; took a long breath, and lifted the vessel to his lips; gazed into it for a moment, dropped the lid with a click, and set it down again with a sigh, for the vessel was empty.

Five minutes elapsed with nothing but smoke floating around, when, presuming upon a brotherly intimacy, the result of years of social communion, Tom removed his pipe from his mouth, and said gruffly to Fred: 'Put on your coat, man.'

Fred looked up, scowled, thrust his hands a little further down into his pockets, and his toes into his stockings, so that one nail glittered through the worn web in the firelight, and then smoked on, faster than ever. Then Tom Brooks spoke again: 'Where's Freddy's coat?'

'Uncle's!' I said laconically, for Fred did not move.

Tom winced a little before once more speaking. 'And boots?' he said, gazing earnestly the while at Fred's obtrusive toes.

'These are his boots,' I said grimly, bringing into notice the pair that graced or disgraced my own feet, for each would have contained a foot and a half, solid measure.

'Humph!' said Tom, with a blank look, and once more lifting the lid of the tankard, to make sure that it was perfectly empty. 'I came to borrow half a sov.'

'Oh, did you?' I said. And then we all smoked again, in a sort of blank despair, staring the while at the fire as if *that* were to blame for our common poverty.

'Can't do it for a fellow, I s'pose?' said Tom.

Fred looked up, first at Tom, and then at me, before bursting into a savage, Victoria-Theatre-ruffian laugh; after which, he seemed relieved, and looked again at his toes.

'Got nothing to drink?' said Tom after another essay at the tankard.

I shook my head, and we all went on smoking.

'I'll trouble you for those boots, Joe,' said Fred, at last bestirring himself; and jumping up, he swept aside the tankard, tobacco, and books upon the table, so as to set at liberty the checked cotton table-cover, red, purple, and gray, and ornamented with gummy rings and brown burned holes, which cover he wrapped round his shoulders after the fashion of the blanket of an Indian chief, what time I proceeded to get out of the large boots.

'How am I to go out without boots?' I said.

'Keep 'em on,' growled Fred, resuming his seat, and once more considering his toes.

'What's going to be done?' said Tom at last; but no one answered save by puffs of smoke.

'This won't do, you know,' resumed he, gazing round the room, and then tearing a pipe-light off an old brief, kept for appearance' sake. 'Let's think it out; but I can't think dry. Can't you get the pot filled? Ale, porter, half-and-half, anything—I'm choking.'

Fred rose from his seat, strode softly into the bedroom, and returned with the handleless water-jug, which he placed upon the table.

'What's the good of humbugging?' growled Tom testily. 'Can't you muster enough between you for that?'

I shook my head.

'Then send and get it filled on credit,' said Tom.

'Freddy sent it down two hours ago,' I explained, 'and they sent the thing back with the bill inside. Like to see?'

'No, thanky,' said Tom, fidgeting in his chair; for he had helped largely to swell that account, fully one-third of the liability having been incurred on his behalf.

'Well,' said Fred, whose pipe was now out, 'what's going to be done?'

'Ah!' said Tom Brooks, 'what's going to be done?'

'Just so,' I said; 'that's the point;' and then there was another pause.

'No one manage a draw from the old folks?' suggested Tom.

We both shook our heads.

'Any one we could borrow of?' said Tom again, but this only resulted in another head-shaking.

'Money's tight in the city,' said Fred grimly. 'Let's go and sing.'

'Do what?' I said.

'Go and sing,' said Fred, 'after spouting both your coats, to produce uniformity, and spending the result.—"All the way from Temple Bar, and got no work to do."'

'And who do you think would lend anything upon our coats?' said Tom. 'Might get something from the Jews, though.'

'But come, I say, be serious; what are we to do?'

'Anything, anybody, so as to turn up a sovereign,' said Tom. 'Oh, the glorious uncertainty of the law! One man starves, while another ascends the woolsack.'

'Too many in the profession,' growled Fred.

'Three, at all events,' said Tom. 'I'd go out of it, if I could find something a little warmer.'

Fred shivered and poked the fire.

'Why don't you fellows write something for the mags?' said Tom.

'We do,' I said, 'but they won't have 'em. Fred's are all "not suited," and mine are "declined with thanks," which sounds better, and is certainly more grammatical, but only comes to the same thing. There's my last,' I said, taking a soiled manuscript from the chimney-piece. '"Declined with thanks," you see.' And Tom took the sketch and began to turn over the leaves.

'What a horrible hand you do write, Joe,' he said; but I would not hear him.

'How are we to raise the wind?' I said to Fred.

'I'll raise a regular storm soon, if things don't alter,' he said savagely. 'If there was one, I'm sure there were a dozen briefs taken into Bulger's yesterday, and he's got a head like a block. Talk to him and see.'

'Wig-block?' I suggested; but Fred was too intent upon his toes to see the point.

'Why, this thing would sell like fun, if it were printed,' said Tom suddenly. 'Let's get it printed, and sell it.'

'Pooh!' said Fred gruffly.

'Pooh be hanged!' said Tom. '"How I was Garrotted;" why, the name would sell it furiously. I shall get it done.'

'But how?' I said; for I felt that if Fred's manuscript had been in question, he would have refrained from saying 'Pooh!'

'I can manage that: I know a man who will put it in type in no time. That's about the only thing

Digitized by Google

I could get credit for. We'll have it done, and then take them round to the shops.'

'Who will?' I said.

'Why, I will!' exclaimed Tom. 'I'm not above doing anything honest for a living,' he continued pompously.

'And what price will you have them sold at?' I said, to humour his notion. 'A shilling?'

'A shilling! and sell one or two!' he exclaimed. 'No, sir: at the immortal penny, and sell millions. Why, this will be a regular golden egg, Joe. You see if it isn't. I'm off.'

In effect he was off; and that night he came rushing in with the wet proof-sheets.

'Now, then!' he exclaimed, dabbing them down upon the table; 'as few alterations as possible, and then we can have them out to-morrow.'

The corrections were made, and Tom departed, after declaring that a plum must result from the speculation; and we saw him no more till the next day at twelve, when he came in, closely followed by the printer's boy, bearing a large bundle of damp copies of the *brochure*.

'Drop o' beer, for bringing 'em, sir?' muttered the boy, hesitating at the door.

'You dog, how dare you!' roared Tom. 'Does Mr Galleys know that you go begging of his'——

He said no more, for the boy had made a precipitate retreat.

'Cuts me to the heart,' said Tom pathetically. 'It was a heavy packet, and he was very civil, but I had not a sou. Mind, I owe that boy sixpence, Joe. I'll pay him some day. I will, 'pon honour,' he continued, for I was laughing. 'But now, about taking these things out. I've been making inquiry, and I find that we must sell them at ninepence a dozen, and give one in. Now, who's going to take them round to the booksellers?'

'Why, you said that you would,' said Fred.

'Well, I did, certainly,' was the reply; 'but as I've managed the printing, I think you two ought to go with the things to the retailers. Wholesale business, you know; nothing to be ashamed of.'

'Got no coat,' said Fred gruffly, though he was now sporting an old shooting-jacket.

'Got no boots,' I said, shewing my feet, now encased in Fred's bead-worked slippers.

'Cowards both!' said Tom contemptuously. 'I shall be back by five, so order a steak from down in the court—steak and oysters, mind;' and then, after looking with great disgust at the parcel for a few minutes, he seized it, and hurried down the stairs; but directly after, he dashed breathlessly into the room. 'More briefs for Bulger's!' he exclaimed, 'and I didn't want to be seen.' Then after waiting ten minutes, he made a fresh start, when we saw no more of him for half an hour, when he came slowly in, and seated himself, looking blankly from one to the other.

'Sold out?' I said.

'Well, no, not exactly,' he replied. 'You see, I went into Thompson's first, in Holborn, that being the first place I cared about stopping at, for fear of being known. I hung about for ten minutes, before I could summon courage enough to go in, for it's awfully hard work when you come to try. There, you need not grin: if you doubt it, go and have a try yourselves. Well, I rushed in at last, with a couple of copies in one hand, and the bundle under my arm, when, hang me! if there wasn't Bulger, buying a cheap copy of *Ivanhoe*, and he nodded at me. Luckily, I had the presence of mind to stuff the two copies into my pocket, and to say to the man behind the counter: "Will you allow me to leave this here till I can send for it? The string has come unfastened."

'And you came away, and left the books there?' I said, interrupting.

'Well, what could I do, under the circumstances?' said Tom. 'Fetch them for me, there's a good fellow. He'll think, from your looks, that you are a man I've paid.'

'Thank you,' I said, trying to light my empty pipe, for we had finished the tobacco.

'Will you go, Fred?' he said, appealing to the man in the shooting-jacket.

'I'd sooner enlist,' said Fred stoically. 'I knew you'd both make fools of yourselves over it.'

'Make what?' said Tom wrathfully. 'Will you oblige me by repeating that expression?'

'I said'——

'Hush!' I exclaimed; 'here's some one coming.'

'Say I'm out,' whispered Fred anxiously. 'It's some one's bill; say I'm gone out of town;' and he darted into the bedroom, and closed the door, while the steps came higher and higher; there was a sharp double tap on the door, and a couple of letters fell into the box inside.

As a matter of course, I was not long in securing the missives, one of which was for me, the other for Fred; the one containing a cheque, and the other, what was nearly as good—namely, the proofs of an article.

'Only to think,' said Tom, 'of that dropping in just in the nick of time;' and he passed his plate for some more gravy. 'Trouble you for another oyster or two, Fred.'

'What shall you do about those tracts, Tom?' said Fred.

'Tracts—tracts?' said Tom thickly. 'Oh, ah, yes—I see; why, we'll get the printer to take it up.' Which he did, and handed over to us, at the end of six months, a balance in our favour of twenty pounds; and though, like many other young beginners who do not practise strict economy, and are not so particular as they should be in making ready-money payments, we have had more than once since to consider how we should 'raise the wind,' we have never yet been quite so 'hard-up.'

MID-DAY IN SUMMER.

Lo! lying in the fierce meridian heat,
The beauteous earth looks like a thing that dreams,
And, all o'ercome with stupor strangely sweet,
She wholly in the warm sun's clutches seems.
Cows seek the shed's cool shade; in sober wise,
So lazily through the languid noontide air,
A crow flies from the high green hill that lies
Aback beyond the flat. The heat, the glare
Chalks out the white highway that runs along
The distant upland. Not a bird makes choice
To warble even the fragment of a song,
And nature would not own a single voice
But for the restless brooks that, all alive,
Murmur like bees content in honeyed hive.

WILL-MAKING.

THE right of testamentary alienation in its present ample extent was unknown to English law until a very late period. The feudal system, as is well known, stood long in opposition to any alienation whatever of land, except by descent. The right which an Englishman now possesses to dispose of his landed property by sale or gift, has been the result of centuries of struggle against the most unyielding opposition, and after all, owes its origin mainly to the guileful devices of crafty lawyers, who, in many notable instances, proved the earliest supporters of popular rights, by their ingenious discoveries in tyrannical statutes of that inevitable breach, existent, as is alleged, in all acts of parliament, through which metaphorical coaches and horses may be driven. By one of their happy inventions (the doctrine of uses), a freeman in the reign of Henry VIII. could, in an illicit way, devise his freehold lands; and seeing this to be the case, a parliament of that reign, with a bad grace, partly endorsed the custom, by a statute recognising testamentary dispositions of lands of socage tenure—a species of ancient freehold of comparative rarity. To this limit dispositions by will of real property were confined till after Charles II.'s restoration, when feudal tenures were abolished, and all freehold land was converted into socage tenure; but the same reign produced a statute, only lately repealed, which necessitated important formalities in the execution of a will. These requirements, together with a mass of ingenuously entangled *leges non scriptæ*, referring to the subject of will-making, made it an interesting speculation, till the year 1831, whether any of that large majority of Englishmen who prefer to make their own wills, unaided by legal advice (and who are known in the courts of law by the contemptuous designation of 'illiterate testators'), could, by any possibility, effect their intentions as to the disposal of their property after death.

Seeing by ages of experience that the stubborn inhabitants of Great Britain, in the face of the libraries of law reports which have been formed from debate over their illiterate wills, still declined any interference of lawyers in the important finality of putting their house in order, parliament some years ago considerately perpetrated two comprehensive acts, which in future are to assist all the lame dogs over the testamentary hedge; and provided the independent Briton will in time to come consent to affix his signature to his will in the presence of two witnesses, he may riot in the expression of any nonsense suggested to his illiterate mind, with the assurance of a very liberal construction being used when it comes to be judicially considered. This desirable consummation was arrived at chiefly by the enactment that all the honoured words which previously had significant legal meanings should be reduced to the ranks of common conversation, and lose their charming distinction; and further, that in the perusal of an 'illiterate' will thereafter, the law should regard indifferently what the testator had actually written, but, with a merciful consideration for his want of legal comprehension, should studiously attempt to discover what he intended to write, and decree accordingly. It will be perceived, therefore, that 'a freehold messuage or tenement with the appurtenances' may now be effectually disposed of, under the description of a 'Villa,' a 'Hermitage,' a 'Retreat,' a 'Rookery,' or any other affectionate designation that its owner may choose to distinguish it whereby; while the hereditary schoolmaster, who for many generations past has been persistently using the solemn word 'heirs,' in the contented anticipation that it would be held more distinctly to confer a life estate on the party with whose name it is associated, and invariably leaving it out at the point on which the whole of an important devise legally rested, is now likely to find his vagaries tenderly considered.

As to the exact place where the testator is to sign his name, it is only necessary to add that none but the most ingeniously eccentric can now err, for a special act of parliament contains a very long list of all the improbable places where a signature of the most perverse or most benighted testator can by any possibility be found—the beginning,

Digitized by Google

the middle, the margin, the back, and everywhere else but the orthodox position; each one of these amusing singularities being now solemnly validated.

Feudal notions seem to have fettered, in early times, the disposition by will of movables even, though, as may be expected, this inconvenience was not of very lengthy duration. However, it is stated in *Fabian's Chronicle*, that 'in the 17th yere of Kinge Henry the second, this was ordeyned, that everye man shold mak his last Will in presaunce of his neighboures, or, at least, cause it to be read in ther presaunse—first, he shold recon what he owed, and to sett so much of his goods: and if he had a Wyf and Childrenne, then the residenue of his goods, his debts being payd, to be devided in 3 partes, one to the Wyfe, one to the Childrenne, and the third to be spent for the wele of his soule. If he had no Childrenne, then the halfe to his soule. If no Wyfe nor Childrenne, then to dispose of his goods at pleasure.'

Although these restrictions were not durable, the custom obtained, and is apparent in all ancient wills, of signing the will in the presence of numerous witnesses; and it is perhaps owing to this necessitated publicity that wills were formerly made only on the hastening approach of death—a fact generally evidenced by the short time elapsing between the date of the will and its probate.

At a time when the disposing power of a testator was limited, at least as to his landed property, it might be supposed that wills were not frequently made; but this would be erroneous. Though land was most commonly disposed of by settlements made in lifetime, yet it was a very general custom of all classes in independent circumstances to make a will, specifically bequeathing articles of furniture, wearing apparel, or jewellery, or particular farming stock, and making small pecuniary bequests to the poor, or for religious or charitable purposes. Moreover, a will was by no means an unimportant confession of faith, and generally contained minute directions as to the testator's burial. Many of these wills were of course not actually proved, but the great number that were verified in this way are all distinguished by these characteristics. The fact that two or three centuries ago the same antipathy to the interference of lawyers in the preparation of a will seems to have prevailed, is the cause of many documents, of which probate has been duly granted, containing much matter that is quaintly original and interesting.

The absence of the legal functionary is easily detected then, as now, from the irrelevant matter with which the testament is augmented; from the gushing fervour of the religious sentiments (formerly forming the first clauses of a will, generally coldly formal in the legally accurate will, and now invariably abandoned); by the intricate verbosity of bequests—as tokens of gratitude, or affection; by the unbusiness-like introduction of paternal advice, or friendly wishes, or the reference to rankling enmities; and the pious reiterations of the hope of resurrection.

Here is an instance, from an old will, of those cases where, through the pressure of approaching death, or intentionally, the man of law was not assisting in the preparation of a will, leaving, consequently, an opportunity for the exhibition of the ruling passion strong in death.

Sir Robert Bevill, of Chesterton, Hunts, who died at the age of sixty-two years, was the representative of a very old family, and a courtier in James I.'s reign. The old knight, three weeks before his death in 1635, signed and published, in the presence of three witnesses, a will, afterwards proved, wherein he first bequeaths his soul, in the then customary fashion, into the hands of his Maker, 'stedfastlie believeing, in and bye the meritts of o^r Lord and Saviour Jesus Christ, to obteyne fre pardon and forgiveness of al my sinnes, and at the last day to have and receive a glorious resurrection.' Then, immediately reverting to the things of corruption, he says: 'Item I give and bequeth to Sir John Hewett Baronett' [his son-in-law] 'Tenn Shillings, and noe more, in respect hee stroake and causelessly fought with me;' and having arranged this satirical memento, he proceeds in the same vein: 'Item I give unto my wife tenn shillings, in respect she tooke her sonnes part ageynst me, and did anymate and comfort him afterwards. These will not be forgotten.' The testator reserves yet another mark of the memory of his wrong, by following with a bequest to some now undistinguished Katherine Byng, of 'all such monies as is due unto mee by Sir John Hewett' [the bellicose son-in-law], 'by virtue of an order or Decre in the Chancery.' (Was this to keep the feud alive?) He then bequeaths all the residue of his large estates to his *second* son; and having in these ways finally confirmed, to the best of his ability, the family dissensions, he contentedly concludes his embittered testament by an exposure of his wife's desertion, as further apologetic of an ample provision for her not being made, 'she having taken all her own goods into her own possession, and disposed of them at her pleasure.'

Let us leave this retributive testator, grimly satisfied with his brief arrangement of worldly affairs, and in his happy confidences of the future, to consider the confessions of another unfortunate individual, who selected similar successful means of permanently recording his desertion and misery. Mr Gervase Holles saw the probate copy of this will 'upon record in the Prerogative Office, in a great vellum book entitled Wingfield,' and thought it worthy of a note among his other manuscript collections. The testator's name is 'William Pime' (or Pym), and he is described as of Woolavington, in the county of Somerset, gentleman. His will is dated 10 January 1608, and is to this effect: 'Item I give and bequeath to ye Church at Wells xiid. Item I give to Agnes (that I did a long time take for my wyfe till of late shee hath denyd mee to bee her husband although wee were marryd w^th. my friends consent her father mother and uncle at it and now shee swereth shee will nevyr love mee neither bee perswaded by preachers nor by any other w^ch. hath happen'd within this few yeres And Toby Andrews the beginner w^ch. I did see w^th. mine own eyes when he did more thann was fitting and this by the means of Robert Musgrove and theire abettors I have lived a miserable life this 6 or 7 yeres and now I leve the revenge to God) tenn pounds to buy her a gret horse for I could not this manny yeres plese her with one gret enough.'

This gloomy joke of the unhappy Pime was put on perpetual record on the 20th September 1610, by the oaths of the two executors, who obtained the grant of probate, swearing faithfully to administer according to their testator's directions.

Digitized by Google

There is evidence in many unprofessional wills of fears of the testators lest any untoward neglect on their part should give birth to *post-mortem* litigation; and the way in which these fears are expressed, and the attempts to provide against any possibility of the calamity of lawyers' quarrels, are very various, and sometimes amusing.

One testator, in Queen Elizabeth's time, wishes that 'if thro' lack of knowledg or through haste he has dealte streghtleye in any way, that that point be reformed.' Another, in the same reign, in very quaint expressions, directs, as is frequently the case with some testators even now-a-days, that all disputes arising out of her will are to be settled by her executors; and that, if their decision is not accepted, the disputant is to take no interest under the will. The first of these directions, in the eye of the law, was, and is now of course meaningless; the second is ingenuously provocative of litigation, about a very clearly expressed will, and never was, or ever could with propriety be accepted by any legal jurisdiction. But here is a more energetic effusion of a similar nature, which apparently has been successfully effectual, for though some of the charitable trusts created by it are even yet in existence, there remains no record of any litigious dispute relating to their administration.

Alderman William Gee, of Kingston-upon-Hull, a wealthy merchant, and the founder of a Yorkshire family of importance, made a very characteristic will in the year 1600, which was duly proved, and which commences with these words: 'Wheras in the Scriptures the gret God of Heven and earthe has willed by the prophet to saye to Hezekia to mak his Will and put things in order for that he must die so I doe now pray and humbly beesech the gret and myghtie God to confounde and destroye al those menn lawyers and others whoever to the devel to dwel yn the pit of Hell who doe or shal doe or tak upon them to alter ys my Will Amen good Lord Amen in the name of God the fayther Allmyghtie Maker of Heven and Earthe the se and al that therein is Amen I William Gee;' &c.

Mr Gee died in 1603, and a very fortunate time it must have been for his neighbours and townspeople, notwithstanding their grief at his departure, for the money which he directs to be distributed at his death to the poor, to the town, and all its charities, is unusually liberal in amount; even the mere fact of dwelling in the same street with him, he makes a reason for a small legacy, thus: 'Item I doe give amonge my neybors in ye same streete wher I doe dwel in moneye to mak merrye withall L2. 13. 4. and soe to give thankes to my good God.'

The following is a specimen of a Yorkshire peasant's will, proved about the same date, singular for its rustic abruptness:

'I William Thorp of Aldborough soul into the hands of Almighty God my Maker and Redeemer to poor man's Box 12s.—to sonne Robert the lease of my house one stagess and one corn wayne and the wood that come home this year and also my couple of oxen—to Alison my dau'r 2 black kye—to dau'rs Anna's and Elizabeth 3 kye *between them*—to Anthony Robinson a Stott of 4 years old and a met of beans and to his children a met of ditto—son Robert and 3 daur's all executors.'

A glance into the very characteristic will of one Richard Coney, who was a Merchant of the Staple, in the reigns of Queen Mary and Elizabeth, gives us an interesting notion of the intimacies of life at that period. Coney lived near Boston, in Lincolnshire, while it was yet a port of great importance, and was the son of a very wealthy merchant residing there, and describing himself also as of Calais; and it was no doubt owing to the taking of that place in 1558, that the disasters to which the will refers were chiefly attributable.

After elaborately expressing his religious faith, and directing his burial to take place at Morton, he proceeds, with the careful minuteness of a man of business, giving, in his directions, a very good notion of what a sale by auction was in the Tudor times: 'Item I will that xx$^{d.}$ be dealte amongst the ringers in Morton and the dynner to be made in my farmehouse in Morton whereto be provided meate and drincke frome Burne needefull and necessarie for suche as shalbe there And ymmediatly after I will that straighteway and as sone as I ame depted there be good and perfecte Inventorie made and taken of all my howsehold stuffe and ympleaments of howseholde within and withoute my howse in pticulers euye thinge of yt selfe alsoe may Inventorie bee made of al my corne and cattell and of euerie thinge and things that onto mee anye waye belongith withoute anye prayse-mente mad then thereof Alsoe that what I owe as what I ame oweing me maye be collected And my Debts I wilbe paide to euerye man makeinge dewe prowfe howe it is owinge hym in convenient tyme as order best maye be takenne—w^{t} them my apparel alsoe I wilbe Inventories whereof at London I have in Jarrette Carrington's custodye a tailor a gowne w^{h} a standinge coller welted with velvette as good as newe and I have lyeinge at the wynde mill in thoulde Jurie' [the Old Jewry] 'a Cloke called a Spanishe Cape faced wth pincked taffetae And for as much as I perceaved ever that my lovinge Wyfe Elizabeth after my deptinge oute of this life will make noe tarryeinge in Burne Therefore and alsoe for that throwe manye and sounderye grete losses wch I have hadd my state is very sore altered at this daye I will my goods be ordered in this manno^{r} and sourte—for my howseholde styffe and ympleaments of howsehold I wilbe ordered and repaired upto the beste and euerye thinge and things ells aboute howse to the uttermost usinge noe deceipte And I will there be proclamacon made at Burne Crosse that there wilbe sale made of suche things assigninge one daye in the weeke to sell y^{t} and even as in Flannders they use there and nowe in London even so I would be that euerie thinge whatsoever I have or oughte anye way to have be soe and in that order solde in my woll folde howse called the guildehowse and if ther be none here in the Countrye that is experte or cunninge to use the hammer in that order and to be made sale in that order then I will that some honneste poore man in London that there have used to sell things in that order be hired to come downe and soe here to sell them And for all suche smalle ympleaments and things that may easealie thronen aboute I will they were bestowed in chests so as theye were not loste nor lackinge And y^{t} there be vi monethes daye geven uppon sellinge to paye for those thinges that shalbe soulde puttinge in good and sufficiente sureties Provided that my wifes apparell either lynnen or wollen that is or shalbe fashioned or made for her at the howre of my dethe be oute

of Inventorie allowinge her the faireste cheste in the howse to putte the same in' [Generous Coney!] 'And in this sale makeinge there be no deceipte used But that he or she whoe offerethe or biddeth moste maye have it as well in howsehold stuffe as in horse sheepe neete or anyethinge that is mine my apparrel in London or elle what shalbe founde mine in London to be eye this order selled my entente is essey to be knowne that I woulde my goods were soulde to the moste So as my poore Estate and sustaunance by euerie meanes collected and gaethered togeder maye appeare.'

There is, at Doctors' Commons, a fund of surprising interest, readily accessible, in the older registers of wills kept there, and, by the more curious, the originals themselves may be inspected; but the public are effectually debarred from any continued indulgence in an antiquarian amusement of this kind by the office regulations, which require the fee of one shilling to be paid for the perusal of each separate will, and if the luxury of an extract be sought for, a further fee of sixpence for every seventy-two words copied is demanded; so that, most probably, a selection of this really interesting matter, in any extensive way, will never reach publication, were the chances of success even such as to tempt the cupidity of speculators.

To those who are personally interested in the matter of will-making, we follow the best legal authorities in entreating them when making a will to avoid the use of any book of forms, however professedly easy or comprehensive, and to use only language dictated by the ordinary judgment and perspicacity of business. The most complete instructions as to making a safe will are contained in these few words: write your wishes as to the disposal of your property, briefly, in your own terms, on paper, and let it be signed by yourself and two witnesses, in each other's presence.

A COUNTY FAMILY.

CHAPTER VI.—THE FAMILY PORTRAITS.

Mr Moffat joined the family circle at dinner on the night of their arrival at the Manor. He had been the only link between Anthony and his old home—the only man who had given himself the trouble to communicate with the exile during his long banishment, and he now reaped the fruits of this in the cordial friendship of the new Squire. At the time of the latter's disgrace, Mowbray Moffat had been articled clerk to his uncle Robert, who had himself, in the character of family lawyer, made some effort to mollify Russell Blackburn's wrath against his eldest born; but when he found interference worse than useless, and also, at his client's direction, had drawn up the deed which seemed to put Anthony's succession to the estate beyond human probability, the elder Moffat had taken no further interest in him, and even cautioned his nephew against the manifestation of such a feeling. But Mowbray had written, though guardedly and cautiously enough, whenever any event of importance had taken place at the Manor; and even these measured phrases of good-will had been very grateful to their recipient. A little kindness goes a great way when we are poor; nay, the very remembrance of us (whom so many have forgotten) appears a kindness. Whether it was genuine pity or only prudent forethought that impelled the man of parchments thus to act, is doubtful. He certainly ran some risk with at least two of his employers—tyrant Russell and spendthrift Ferdinand—who had strictly commanded all relations with the Disgrace to the Family to cease; not, it must be confessed, by reason of Anthony's first offence alone, but from his subsequent conduct. The letters he wrote to his father were not of a conciliatory character; and that which, on the occasion of the old man's death, he addressed to his usurping successor, was really quite a curiosity in the way of vituperation. But in course of years, passionate indignation had given place to patient watching for retribution—hoarded hate. He ceased to rave of his own wrongs, or to make comments upon the proceedings of his detested kinsmen; but on the demise of each brother he had put in a written protest against the continuance of the injustice which their common father had perpetrated.

To these letters, Mr Moffat had been instructed, on the part of his clients, to make no reply; but he had always written, on his own account, to express a decent sorrow for Anthony's misfortune; that is, for his banishment, not for the trials which poverty imposed upon him, for of those he knew nothing for certain, whatever he may have guessed. Anthony's pride prevented him from making that disclosure by letter, which his passion, excited by the sight of his old home, had just compelled him so openly to proclaim. The lawyer perhaps had his own reasons for not inquiring too nearly into his correspondent's actual circumstances; however willing to offer sympathy, and even advice, he might have shrunk from advancing money out of his own pocket to supply Anthony's necessities—the security being so exceedingly problematical. Of course, he knew that his old friend—for they had been playmates together, or rather he had been the young Squire's humble companion, while the next brother, Ferdinand, was still in the nursery—was very poor; but the fact was not pressed upon his notice, and he was glad to ignore it. Perhaps, if he had known how poor the inmates of Moor Cottage had been—how small a sum would have seemed a fortune to them—he would have drawn his purse-strings readily enough. Of late, however, Mr Moffat might well have defended himself from the charge of want of charity, upon the ground of fearing to wound Anthony's feelings—for it was upon the question of Richard Blackburn's affording his uncle pecuniary assistance that the lawyer and his present client had well-nigh quarrelled; Mr Moffat had accompanied his employer's offer not only with an earnest entreaty that it should be accepted, but even with an encomium upon the young Squire's liberality and good-feeling; and this the resolute old quarryman had bitterly resented. Indeed, no communication had passed between them since that period, except the one letter that had apprised the old man of his nephew's death. Their meeting, therefore, at least upon one side, had had something of embarrassment; but the few earnest words of gratitude that accompanied the Squire's warm grip of salutation had at once put the lawyer at his ease.

'I am a stranger in my own home,' the former

Digitized by Google

had gone on to say, 'and it is to you, to whom I have so long been indebted, that I must for the future look for aid of all kinds.'

If Mr Moffat had been aware of the company which his host had kept perforce for so many years, he would certainly have marvelled to hear him use such well-chosen words; but he remembered Anthony as having had the pleasantest voice and the most winning address of all the Blackburns, who, to say the truth, had been (with one other exception) a rough lot, both in speech and feeling. He marvelled, therefore, not at Anthony's comparative culture (though there was much else in him to wonder at), but at the lack of it in Mrs Blackburn, which, indeed, throughout the repast was manifest enough. She partook of every dish, and every condiment which could be taken with them; she mixed her liquors in a really alarming manner; and in the intervals of the meal, she betook herself to balancing the silver forks upon her finger, with the relish of a person who partakes of an amusement for the first time. Moreover, though Mr Moffat was well acquainted with the local dialect, her talk was sometimes utterly unintelligible to him; the fact being, that the family, in their earlier days of poverty, had been migratory, and the consequence, in Mrs Blackburn's case, had been a combination of *patois*.

But the chief enigma of the little party to the astute man of business, very desirous of solving the three social problems before him, was Miss Ellen. Her features were not only well formed, but possessed that softened beauty which belongs in general to those who have been brought up delicately; who have experienced that hot-house training, the result of which is mistaken for that of aristocratic birth. Her hands were as white, if not quite so smooth, as those of any young lady in the county; and though her speech was more elaborate and stiff, the words were better selected.

The dinner conversation was not, however, general, but chiefly maintained by Mr Moffat and his host; the latter asking question after question respecting this man and that, whose face of fifty years ago had been familiar to him; and the latter, nine times out of ten, replying, with a shake of his white head: 'He is dead and gone, sir.'

And all this time the servants waited with wondering eyes, speculating upon their master's past, and endeavouring to forecast from it their own future. It was already evident to them that they would not, as some had expected, have everything their own way with him; yet he had only once spoken angrily, when he bade them let that day be the last on which he should see them in mourning apparel. Any reference, however undemonstrative, to his immediate predecessors at the Manor-house seemed intolerable to him. The dining-room was hung with full-length portraits of his father and brothers, and it was observed that an angry flush came over his face whenever his eye wandered towards them during the meal; but when it was over, and the ladies had withdrawn, and the obsequious butler was placing a bottle of rare port upon the table, with a few words of respectful encomium, he was arrested by the startling words from the Squire: 'Get a ladder, man, at once, and take all those pictures down.'

While host and guest were sipping their wine in silence, this accordingly was done; and some half-dozen huge frames, with their contents, were soon standing in a line against the wall, like criminals awaiting execution. They had most of them fine handsome features, but of an animal type.

'That is my father, of course,' observed Anthony coldly, as he pointed to a burly figure with puffed cheeks and sensual chin, who occupied the middle place. There was a twinkle in the eye that hinted of humour, or perhaps only of the pleasures of the flesh, but it was marred by an obliquity of vision which imparted malignancy; indeed, it was easy to imagine it becoming 'a damned disinheriting countenance,' if irritated by opposition, and such it unquestionably seemed to the present beholder. 'This must have been taken after my time,' continued he, rising and confronting the canvas, as though it were a thing of life; 'yet I should know it anywhere. He was a hard man, except where his own vices were concerned, and then he was weak enough.—Was it not so, Mr Moffat?'

'Indeed, sir,' stammered the lawyer, straightening his stiff white cravat, 'I had no certain knowledge of the late Mr Russell Blackburn. My uncle Robert, as you were aware, was the family lawyer throughout almost all your father's life.'

'Ay, true,' replied Anthony, cynically; 'and of course you never heard his character discussed. With the rest of this goodly company, however, you had a closer acquaintance than myself.—Is that my brother Ferdinand?'
